Version 2.8
December 03, 2014.
## Revision History

<table>
<thead>
<tr>
<th>Version</th>
<th>Changes</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.0</td>
<td>Added Version Number to document. Added sections on Default Signal Values for unconnected ports.</td>
</tr>
<tr>
<td>2.1</td>
<td>Added PLL primitives</td>
</tr>
<tr>
<td>2.2</td>
<td>Corrected SB_CARRY connections to LUT inputs</td>
</tr>
<tr>
<td>2.3</td>
<td>Added iCE40 RAM, PLL primitives.</td>
</tr>
<tr>
<td>2.4</td>
<td>Added PLL_DS, SB_MIPI_RX_2LANE, SB_TMDS_deserializer primitives.</td>
</tr>
<tr>
<td>2.5</td>
<td>Added SB_MAC16 Primitive details.</td>
</tr>
<tr>
<td>2.6</td>
<td>Added iCE40LM Hard Macro details. Removed PLL_DS, SB_MIPI, SB_TMDS, SB_MAC16 primitive details.</td>
</tr>
<tr>
<td>2.7</td>
<td>Added iCE5LP (iCE40 Ultra) primitive details.</td>
</tr>
<tr>
<td>2.8</td>
<td>Removed iCE65 RAM, PLL details.</td>

Register Primitives

**SB_DFF**

D Flip-Flop

Data: D is loaded into the flip-flop during a rising clock edge transition.

![D Flip-Flop Diagram]

<table>
<thead>
<tr>
<th>Inputs</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>D</td>

</tr>
<tr>
<td>Power on State</td>
<td>X</td>
</tr>
</tbody>
</table>

Key

- **Rising Edge**: 1 High logic level, 0 Low logic level
- **X**: Don't care
- **?**: Unknown

**HDL use**

This register is inferred during synthesis and can also be explicitly instantiated.

**Verilog Instantiation**

```verilog
// SB_DFF - D Flip-Flop.
SB_DFF SB_DFF_inst (  
  .Q(Q),        // Registered Output  
  .C(C),        // Clock  
  .D(D),        // Data
);

// End of SB_DFF instantiation
```
VHDL Instantiation

-- SB_DFF - D Flip-Flop.

SB_DFF_inst: SB_DFF
  port map (
    Q => Q,       -- Registered Output
    C => C,       -- Clock
    D => D,       -- Data
  );

-- End of SB_DFF instantiation
**SB_DFFE**  
D Flip-Flop with Clock Enable

Data D is loaded into the flip-flop when Clock Enable E is high, during a rising clock edge transition.

![SB_DFFE Diagram]

<table>
<thead>
<tr>
<th>Inputs</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>E</td>

</tr>
</tbody>
</table>

**Key**
- Rising Edge
- 1 High logic level
- 0 Low logic level
- X Don’t care
- ? Unknown

**HDL Usage**
This register is inferred during synthesis and can also be explicitly instantiated.

**Default Signal Values**
The iCEcube2 software assigns the following signal values to unconnected input ports:

Input D: Logic ‘0’  
Input C: Logic ‘0’  
Input E: Logic ‘1’

Note that explicitly connecting a logic ‘1’ value to port E will result in a non-optimal implementation, since an extra LUT will be used to generate the logic ‘1’. It is recommended that the user leave the port E unconnected, or use the corresponding flip-flop without Enable functionality i.e. the DFF primitive.

**Verilog Instantiation**

```verilog
// SB_DFFE - D Flip-Flop with Clock Enable.
SB_DFFE SB_DFFE_inst (  
  .Q(Q),  // Registered Output  
  .C(C),  // Clock  
  .D(D),  // Data  
  .E(E),  // Clock Enable  
);  
// End of SB_DFFE instantiation
```
VHDL Instantiation

-- SB_DFFE - D Flip-Flop with Clock Enable.

SB_DFFE_inst: SB_DFFE
  port map (  
    Q => Q,        -- Registered Output  
    C => C,        -- Clock  
    D => D,        -- Data  
    E => E,        -- Clock Enable  
  );

-- End of SB_DFFE instantiation
**SB_DFFSR**

D Flip-Flop with Synchronous Reset

Data: D is loaded into the flip-flop when Reset R is low during a rising clock edge transition.

Reset: R input is active high, overrides all other inputs and resets the Q output during a rising clock edge.

<table>
<thead>
<tr>
<th>Inputs</th>
<th>Output</th>

Key

- ✓ Rising Edge
- 1 High logic level
- 0 Low logic level
- X Don’t care
- ? Unknown

**HDL Usage**

This register is inferred during synthesis and can also be explicitly instantiated.

**Default Signal Values**

The iCECube2 software assigns the following signal values to unconnected input ports:

- Input D: Logic ‘0’
- Input C: Logic ‘0’
- Input R: Logic ‘0’

**Verilog Instantiation**

```verilog
// SB_DFFSR - D Flip-Flop, Reset is synchronous with the rising clock edge
SB_DFFSR SB_DFFSR_inst (  
    .Q(Q),       // Registered Output  
    .C(C),       // Clock  
    .D(D),       // Data  
    .R(R),       // Synchronous Reset  
);
```

// End of SB_DFFSR instantiation
VHDL Instantiation

-- SB_DFFSR - D Flip-Flop, Reset is synchronous with the rising clock edge

SB_DFFSR_inst : SB_DFFSR
    port map (
        Q => Q,     -- Registered Output
        C => C,     -- Clock
        D => D,     -- Data
        R => R      -- Synchronous Reset
    );

-- End of SB_DFFSR instantiation
**SB_DFFR**

D Flip-Flop with Asynchronous Reset

Data: D is loaded into the flip-flop when R is low during a rising clock edge transition.

Reset: R input is active high, overrides all other inputs and asynchronously resets the Q output.

<table>
<thead>
<tr>
<th>Inputs</th>
<th>Output</th>
</tr>

### Key

- 🔺 Rising Edge
- 1 High logic level
- 0 Low logic level
- X Don’t care
- ? Unknown

#### HDL Usage

This register is inferred during synthesis and can also be explicitly instantiated.

#### Default Signal Values

The iCEcube2 software assigns the following signal values to unconnected input ports:

- Input D: Logic '0'
- Input C: Logic '0'
- Input R: Logic '0'

#### Verilog Instantiation

```
// SB_DFFR - D Flip-Flop, Reset is asynchronous to the clock.
SB_DFFR   SB_DFFR_inst (  
   .Q(Q),     // Registered Output
   .C(C),     // Clock
   .D(D),     // Data
   .R(R)      // Asynchronous Reset
 );
```
VHDL Instantiation

-- SB_DFFR - D Flip-Flop, Reset is asynchronous to the clock.

SB_DFFR_inst: SB_DFFR
    port map (  
        Q => Q,       -- Registered Output  
        C => C,       -- Clock  
        D => D,       -- Data  
        R => R       -- Asynchronous Reset  
    );

-- End of SB_DFFR instantiation
**SB_DFFSS**

D Flip-Flop with Synchronous Set

Data: D is loaded into the flip-flop when the Synchronous Set S is low during a rising clock edge transition.

Set: S input is active high, overrides all other inputs and synchronously sets the Q output.

<table>
<thead>
<tr>
<th>Inputs</th>
<th>Output</th>

</tr>
<tr>
<td>?    Unknown</td>
</tr>
</tbody>
</table>

**HDL Usage**

This register is inferred during synthesis and can also be explicitly instantiated.

**Default Signal Values**

The iCEcube2 software assigns the following signal values to unconnected input ports:

Input D: Logic '0'
Input C: Logic '0'
Input S: Logic '0'

**Verilog Instantiation**

```verilog
// SB_DFFSS - D Flip-Flop, Set is synchronous with the rising clock edge,
SB_DFFSS SB_DFFSS_inst (  // Registered Output
  .Q(Q),  // Clock
  .C(C),  // Data
  .D(D),  // Synchronous Set
  .S(S)
);
```

// End of SB_DFFSS instantiation
VHDL Instantiation

-- SB_DFFSS - D Flip-Flop, Set is synchronous with the rising clock edge

SB_DFFSS_inst SB_DFFSS
   port map (  
      Q => Q, -- Registered Output  
      C => C, -- Clock  
      D => D, -- Data  
      S => S -- Synchronous Set  
   );

-- End of SB_DFFSS instantiation
**SB_DFFS**

D Flip-Flop with Asynchronous Set

Data: D is loaded into the flip-flop when S is low during a rising clock edge transition.

Set: S input is active high, and it overrides all other inputs and asynchronously sets the Q output.

<table>
<thead>
<tr>
<th>Inputs</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>S</td>
<td>D</td>
</tr>
<tr>
<td>1</td>
<td>X</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>Power on State</td>
<td>X</td>
</tr>
</tbody>
</table>

**HDL Usage**

This register is inferred during synthesis and can also be explicitly instantiated.

**Default Signal Values**

The iCEcube2 software assigns the following signal values to unconnected input ports:

- Input D: Logic ‘0’
- Input C: Logic ‘0’
- Input S: Logic ‘0’

**Verilog Instantiation**

```verbatim
// SB_DFFS - D Flip-Flop, Set is asynchronous to the rising clock edge
SB_DFFS   SB_DFFS_inst (  
   .Q(Q),      // Registered Output
   .C(C),      // Clock
   .D(D),      // Data
   .S(S)       // Asynchronous Set
 );
```

// End of SB_DFFS instantiation
VHDL Instantiation

-- SB_DFFS - D Flip-Flop, Set is asynchronous to the rising clock edge

SB_DFFS_inst: SB_DFFS
  port map (    
    Q => Q,      -- Registered Output
    C => C,      -- Clock
    D => D,      -- Data
    S => S      -- Asynchronous Set
  );

-- End of SB_DFFS instantiation
**SB_DFFESR**  
D Flip-Flop with Clock Enable and Synchronous Reset

Data: D is loaded into the flip-flop when Reset R is low and Clock Enable E is high during a rising clock edge transition.

Reset: R, when asserted with Clock Enable E high, synchronously resets the Q output during a rising clock edge.

```
<table>
<thead>
<tr>
<th>Inputs</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>R</td>
<td>E</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>X</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>Power on State</td>
<td>X</td>
</tr>
</tbody>
</table>
```

**HDL Usage**  
This register is inferred during synthesis and can also be explicitly instantiated.

**Default Signal Values**  
The iCEcube2 software assigns the following signal values to unconnected input ports:

- Input D: Logic ‘0’
- Input C: Logic ‘0’
- Input R: Logic ‘0’
- Input E: Logic ‘1’

Note that explicitly connecting a Logic ‘1’ value to port E will result in a non-optimal implementation, since an extra LUT will be used to generate the Logic ‘1’. If the user’s intention is to keep the FF always enabled, it is recommended that either port E be left unconnected, or the corresponding FF without a Clock Enable port be used.
Verilog Instantiation

// SB_DFFESR - D Flip-Flop, Reset is synchronous with rising clock edge
// Clock Enable.
SB_DFFESR   SB_DFFESR_inst (
    .Q(Q),      // Registered Output
    .C(C),      // Clock
    .E(E),      // Clock Enable
    .D(D),      // Data
    .R(R)       // Synchronous Reset
);

// End of SB_DFFESR instantiation

VHDL Instantiation

-- SB_DFFESR - D Flip-Flop, Reset is synchronous with rising clock edge
-- Clock Enable.
SB_DFFESR_inst: SB_DFFESR
    port map ( Q => Q, -- Registered Output
                C => C, -- Clock
                E => E, -- Clock Enable
                D => D, -- Data
                R => R  -- Synchronous Reset
    );

-- End of SB_DFFESR instantiation
**SB_DFFER**

D Flip-Flop with Clock Enable and Asynchronous Reset

Data: D is loaded into the flip-flop when Reset R is low and Clock Enable E is high during a rising clock edge transition.

Reset: R input is active high, overrides all other inputs and asynchronously resets the Q output.

Key
- Fallingle Edge
- 1 High logic level
- 0 Low logic level
- X Don’t care
- ? Unknown

HDL Usage
This register is inferred during synthesis and can also be explicitly instantiated.

**Default Signal Values**
The iCEcube2 software assigns the following signal values to unconnected input ports:
Input D: Logic ‘0’
Input C: Logic ‘0’
Input E: Logic ‘1’

Note that explicitly connecting a Logic ‘1’ value to port E will result in a non-optimal implementation, since an extra LUT will be used to generate the Logic ‘1’. If the user’s intention is to keep the FF always enabled, it is recommended that either port E be left unconnected, or the corresponding FF without a Clock Enable port be used.

**Verilog Instantiation**

```verilog
// SB_DFFNE - D Flip-Flop – Negative Edge Clock and Clock Enable.
SB_DFFNE  SB_DFFNE_inst (    
    .Q(Q), // Registered Output
    .C(C), // Clock
    .D(D), // Data
    .E(E), // Clock Enable
);
```
// End of SB_DFFNE instantiation

VHDL Instantiation

-- SB_DFFNE - D Flip-Flop – Negative Edge Clock and Clock Enable.

SB_DFFNE_inst : SB_DFFNE
    port map (  
        Q  => Q,       -- Registered Output  
        C  => C,       -- Clock  
        D  => D,       -- Data  
        E  => E,       -- Clock Enable  
    );

-- End of SB_DFFNE instantiation
**SB_DFFNSR**

D Flip-Flop – Negative Edge Clock with Synchronous Reset

Data: D is loaded into the flip-flop when R is low during the falling clock edge transition.

Reset: R input is active high, overrides all other inputs and resets the Q output during the falling clock edge transition.

        I2 => I2,
        I3 => I3,
        O => 0
    );
**SB_CARRY**

**Carry Logic**

The dedicated Carry Logic within each Logic Cell primarily accelerates and improves the efficiency of arithmetic logic such as adders, accumulators, subtracters, incrementers, decrementers, counters, ALUs, and comparators. The Carry Logic also supports a limited number of wide combinational logic functions.

The figure below illustrates the Carry Logic structure within a Logic Cell. The Carry Logic shares inputs with the associated Look-Up Table (LUT). The I1 and I2 inputs of the LUT directly feed the Carry Logic. The carry input from the previous adjacent Logic Cell optionally provides an alternate input to the LUT4 function, supplanting the I3 input.

Block RAM Primitives

The iCE architecture supports dual ported synchronous RAM, with 4096 bits, and a fixed 16 bit data-width. The block is arranged as 256 x 16 bit words. The RAM block may be configured to be used as a RAM with data between 1-16 bits.

**iCE40 Block RAM**

Each iCE40 device includes multiple high-speed synchronous RAM blocks, each 4Kbit in size. The RAM block has separate write and read ports, each with independent control signals. Each RAM block can be configured into a RAM block of size 256x16, 512x8, 1024x4 or 2048x2. The data contents of the RAM block are optionally pre-loaded during ICE device configuration.

The following table lists the supported dual port synchronous RAM configurations, each of 4Kbits in size. The RAM blocks can be directly instantiated in the top module and taken through iCube2 flow.

<table>
<thead>
<tr>
<th>Block RAM Configuration</th>

The Lattice Technologies convention for the iCE40 RAM primitives with negedge Read or Write clock is that the base primitive name is post fixed with N and R or W according to the clock that is affected, as displayed in the table below for 256x16 RAM block configuration.

<table>
<thead>
<tr>
<th>RAM Primitive Name</th>
<th>Description</th>
</tr>

**SB_RAM40_4K**

SB_RAM40_4K is the basic physical RAM primitive which can be instantiated and configured to different depth and dataports. The SB_RAM40_4K block has a size of 4K bits with separate write and read ports, each with independent control signals. By default, input and output data is 16 bits wide, although the data width is configurable using the READ_MODE and WRITE_MODE parameters. The data contents of the SB_RAM40_4K block are optionally pre-loaded during ICE device configuration.

**SB_RAM40_4K Naming Convention Rules**

<table>
<thead>
<tr>
<th>RAM Primitive Name</th>

IO Primitives

**SB_IO**
The SB_IO block contains five registers. The following figure and Verilog template illustrate the complete user accessible logic diagram, and its Verilog instantiation.

![Logic Diagram](image)

**Default Signal Values**
The iCEcube2 software assigns the logic ‘0’ value to all unconnected input ports except for CLOCK_ENABLE.

Note that explicitly connecting a logic ‘1’ value to port CLOCK_ENABLE will result in a non-optimal implementation, since an extra LUT will be used to generate the Logic ‘1’. If the user’s intention is to keep the Input and Output registers always enabled, it is recommended that port CLOCK_ENABLE be left unconnected.
Input and Output Pin Function Tables

Input and Output functions are independently selectable via PIN_TYPE [1:0] and PIN_TYPE [5:2] parameter settings respectively. Specific IO functions are defined by the combination of both attributes. This means that the complete number of combinations is 64, although some combinations are not valid and not defined below.

Note that the selection of IO Standards such as SSTL and LVCMOS are not defined by these tables.

### Input Pin Function Table

<table>
<thead>
<tr>
<th>#</th>
<th>Pin Function Mnemonic</th>
<th>PIN_TYPE[1:0]</th>
<th>Functional Description of Package Pin Input Operation</th>

<td>Output signal is registered and inverted, the enable/tristate control is registered.</td>
</tr>
</tbody>
</table>
Syntax Verilog Use

Output Pin Function is the bit vector associated with PIN_TYPE [5:2] and Input Pin Function is the bit vector associated with PIN_TYPE [1:0], resulting in a 6 bit value PIN_TYPE [5:0]

```
defparam my_generic_IO.PIN_TYPE = 6'b(Output Pin Function, Input Pin Function);
```

DDR IO Configuration

The following setting configures the SB_IO into a DDR IO.

```
defparam my_DDR_IO.PIN_TYPE = 6'b100000;

// PIN_TYPE [5:2] = 1000
// PIN_TYPE [1:0] = 00
```

This creates a DDR IO pin whereby the input data is clocked in on both the rising and falling input clock edges.

The output ‘DDR’ data is clocked out on rising and falling output clock edges, and the output may be tri-stated, using the output enable port of the SB_IO.

High Drive SB_IO

IO’s in iCE40/iCE40LM device can be configured with different drive strengths to increase the IO output current. To configure an SB_IO with specific drive value, the user needs to specify the “DRIVE_STRENGTH” synthesis attribute on the SB_IO instance and the IO should be configured as output-only registered IO.

Synthesis Attribute Syntax:

```
/* synthesis DRIVE_STRENGTH = <Drive value> */

Drive Value:
```

<table>
<thead>
<tr>
<th>Drive Strength Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x1</td>
<td>Default drive strength. No replication of SB_IO.</td>
</tr>
<tr>
<td>x2</td>
<td>Increase default drive strength by 2. SB_IO replicated once.</td>
</tr>
<tr>
<td>x3</td>
<td>Increase default drive strength by 3. SB_IO replicated twice.</td>
</tr>
</tbody>
</table>

Note: High drive SB_IO is available only in selected iCE40/iCE40LM packages. Refer to Chapter 12 in iCEcube2_userguide for the list of supported device packages.
Verilog Instantiation

SB_IO    IO_PIN_INST
       (  
       .PACKAGE_PIN (Package_Pin), // User's Pin signal name
       .LATCH_INPUT_VALUE (latch_input_value), // Latches/holds the Input_value
       .CLOCK_ENABLE (clock_enable), // Clock Enable common to input and output clock
       .INPUT_CLK (input_clk), // Clock for the input registers
       .OUTPUT_CLK (output_clk), // Clock for the output registers
       .OUTPUT_ENABLE (output_enable), // Output Pin Tristate/Enable control
       .D_OUT_0 (d_out_0), // Data 0 - out to Pin/Rising clk edge
       .D_OUT_1 (d_out_1), // Data 1 - out to Pin/Falling clk edge
       .D_IN_0 (d_in_0), // Data 0 - Pin input/Rising clk edge
       .D_IN_1 (d_in_1) // Data 1 - Pin input/Falling clk edge
       )  /* synthesis DRIVE_STRENGTH= x2 */;

defparam IO_PIN_INST.PIN_TYPE = 6'b000000; // See Input and Output Pin Function Tables.
   // Default value of PIN_TYPE = 6'000000 i.e.
   // an input pad, with the input signal registered.

defparam IO_PIN_INST.PULLUP = 1'b0; // By default, the IO will have NO pull up.
   // This parameter is used only on bank 0, 1, 2. Ignored when it is placed at bank 3.

defparam IO_PIN_INST.NEG_TRIGGER = 1'b0; // Specify the polarity of all FFs in the IO to be falling edge when NEG_TRIGGER = 1.
   // Default is rising edge.

defparam IO_PIN_INST.IO_STANDARD = "SB_LVCMOS"; // Other IO standards are supported in bank 3 only: SB_SSTL2_CLASS_2, SB_SSTL2_CLASS_1,
   // SB_SSTL18_FULL, SB_SSTL18_HALF, SB_MDDR10, SB_MDDR8, SB_MDDR4, SB_MDDR2 etc.
Global Buffer Primitives

**SB_GB_IO**

**Default Signal Values**

The iCEcube2 software assigns the logic '0' value to all unconnected input ports except for CLOCK_ENABLE.

Note that explicitly connecting a logic '1' value to port CLOCK_ENABLE will result in a non-optimal implementation, since an extra LUT will be used to generate the Logic '1’. If the user's intention is to keep the Input and Output registers always enabled, it is recommended that port CLOCK_ENABLE be left unconnected.

**Verilog Instantiation**

```
SB_GB_IO My_Clock_Buffer_Package_Pin (                        // A users external Clock reference pin
   .PACKAGE_PIN (Package_Pin),                               // User's Pin signal name
   .LATCH_INPUT_VALUE (latch_input_value),                   // Latches/holds the Input value
   .CLOCK_ENABLE (clock_enable),                             // Clock Enable common to input and
                                                               // output clock
)
```
.INPUT_CLK (input_clk), // Clock for the input registers
 OUTPUT_CLK (output_clk), // Clock for the output registers
 OUTPUT_ENABLE (output_enable), // Output Pin Tristate/Enable
                                    // control
 D_OUT_0 (d_out_0),            // Data 0 – out to Pin/Rising clk
                                    // edge
 D_OUT_1 (d_out_1),            // Data 1 – out to Pin/Falling clk
                                    // edge
 D_IN_0 (d_in_0),              // Data 0 – Pin input/Rising clk
                                    // edge
 D_IN_1 (d_in_1)               // Data 1 – Pin input/Falling clk
                                    // edge

 GLOBAL_BUFFER_OUTPUT (Global_Buffered_User_Clock) // Example use – clock buffer
                                    // driven from the input pin
);

defparam My_Clock_Buffer_Package_Pin.PIN_TYPE = 6'b000000;
                                    // See Input and Output Pin Function Tables.
                                    // Default value of PIN_TYPE = 6'000000 i.e.
                                    // an input pad, with the input signal
                                    // registered

Note that this primitive is a superset of the SB_IO primitive, and includes the connectivity to drive a Global Buffer. For example SB_GB_IO pins are likely to be used for external Clocks.

SB_GB Primitive

![user_signal_to_global_buffer](image)

Verilog Instantiation

SB_GB My_Global_Buffer_i ( //Required for a user’s internally generated
                                    //FPGA signal that is heavily loaded and
                                    //requires global buffering. For example, a
                                    //user’s logic-generated clock.

.USER_SIGNAL_TO_GLOBAL_BUFFER (Users_internal_CLK),
.GLOBAL_BUFFER_OUTPUT (Global_Buffered_User_Signal)
);

ICE Technology Library
Lattice Semiconductor Corporation Confidential
PLL Primitives

The Phase Lock Loop (PLL) function is offered as a feature in certain iCE device packages.

It is strongly recommended that the configuration of the PLL primitives be accomplished through the use of the PLL Configuration tool that is offered as part of the iCEcube2 software.

**iCE40 PLL Primitives**

There are 5 primitives that represent the PLL function in the iCEcube2 software viz. SB_PLL40_CORE, SB_PLL40_PAD, SB_PLL40_2_PAD, SB_PLL40_2F_CORE and SB_PLL40_2F_PAD for the ice40 device family. A short description of each primitive and its ports/parameters is provided in the following sections.

It is strongly recommended that the configuration of the PLL primitives be accomplished through the use of the PLL Configuration tool that is offered as part of the iCEcube2 software.

**SB_PLL40_CORE**

The SB_PLL40_CORE primitive should be used when the source clock of the PLL is driven by FPGA routing i.e. when the PLL source clock originates on the FPGA or is driven by an input pad that is not in the bottom IO bank (IO Bank 2).

![SB_PLL40_CORE](image)

**Ports**

*REFERENCECLK*: PLL source clock that serves as the input to the SB_PLL40_CORE primitive.

*PLLOUTGLOBAL*: Output clock generated by the PLL, drives a global clock network on the FPGA.

*PLLOUTCORE*: Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTGLOBAL port.

*LOCK*: Output port, when HIGH, indicates that the signal on PLLOUTGLOBAL/PLLOUTCORE is locked to the PLL source on REFERENCECLK.

*EXTFEEDBACK*: External feedback input to PLL. Enabled when the FEEDBACK_PATH parameter is set to EXTERNAL.
**DYNAMICDELAY:** 7 bit input bus that enables dynamic control of the delay contributed by the Fine Delay Adjust Block. The Fine Delay Adjust Block is used when there is a need to adjust the phase alignment of PLLOUTGLOBAL/PLLOUTCORE with respect to REFERENCECLK. The DYNAMICDELAY port controls are enabled when the DELAY_ADJUSTMENT_MODE parameter is set to DYNAMIC.

**RESETB:** Active low input that asynchronously resets the PLL.

**BYPASS:** Input signal, when asserted, connects the signal on REFERENCECLK to PLLOUTCORE/PLLOUTGLOBAL pins.

**LATCHINPUTVALUE:** Active high input, when enabled, forces the PLL into low-power mode. The PLLOUTGLOBAL/PLLOUTCORE pins are held static at their last value. This function is enabled when the parameter ENABLE_ICEGATE is set to ‘1’.

**SCLK, SDI, SDO:** These pins are used only for internal testing purposes, and need not be instantiated by users.

**Parameters**
The SB_PLL40_CORE primitive requires configuration through the specification of the following parameters. It is strongly recommended that the configuration of the PLL primitives be accomplished through the use of the PLL Configuration tool that is offered as part of the iCEcube2 software.

**SB_PLL40_2_PAD**

The SB_PLL40_2_PAD primitive should be used when the source clock of the PLL is driven by an input pad that is located in the bottom IO bank (IO Bank 2) or the top IO bank (IO Bank 0), and in addition to the PLL output, the source clock is also required inside the FPGA.

![SB_PLL40_2_PAD Diagram]

**Ports**

**PACKAGEPIN**: PLL source clock that serves as the input to the SB_PLL_PAD primitive.

**PLLOUTGLOBALA**: The signal on PACKAGEPIN appears on the FPGA at this pin, and drives a global clock network on the FPGA. Do not use this pin in an external feedback path to the PLL.

**PLLOUTCOREA**: The signal on PACKAGEPIN appears on the FPGA at this pin, which drives regular FPGA routing. Do not use this pin in an external feedback path to the PLL.

**PLLOUTGLOBALB**: Output clock generated by the PLL, drives a global clock network on the FPGA.

**PLLOUTCOREB**: Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTGLOBAL port.

**LOCK**: Output port, when HIGH, indicates that the signal on PLLOUTGLOBALB/PLLOUTCOREB is locked to the PLL source on PACKAGEPIN.

**EXTFEEDBACK**: External feedback input to PLL. Enabled when the FEEDBACK_PATH parameter is set to EXTERNAL.

**DYNAMICDELAY**: 4 bit input bus that enables dynamic control of the delay contributed by the Fine Delay Adjust Block. The Fine Delay Adjust Block is used when there is a need to adjust the phase alignment of PLLOUTGLOBAL/PLLOUTCORE with respect to REFERENCECLK. The DYNAMICDELAY port controls are enabled when the DELAY_ADJUSTMENT_MODE parameter is set to DYNAMIC.

**RESET**: Active low input that asynchronously resets the PLL.

**BYPASS**: Input signal, when asserted, connects the signal on REFERENCECLK to PLLOUTCORE/PLLOUTGLOBAL pins.
**LATCHINPUTVALUE:** Active high input, when enabled, forces the PLL into low-power mode. The PLLOUTGLOBALA/PLLOUTCOREA pins are held static at their last value only when the parameter ENABLE_ICEGATE_PORTA is set to ‘1’, and the LATCHINPUTVALUE signal is asserted. The PLLOUTGLOBALB/PLLOUTCOREB pins are held static at their last value only when the parameter ENABLE_ICEGATE_PORTB is set to ‘1’, and the LATCHINPUTVALUE signal is asserted.

**SCLK, SDI, SDO:** These pins are used only for internal testing purposes, and need not be instantiated by users.

**SB_PLL40_2F_CORE**

The SB_PLL40_2F_CORE primitive should be used when PLL is used to generate 2 different output frequencies, and the source clock of the PLL is driven by FPGA routing i.e. when the PLL source clock originates on the FPGA.

Ports

*REFERENCECLK*: PLL source clock that serves as the input to the SB_PLL40_2F_CORE primitive.

*PLLOUTGLOBALA*: Output clock generated by the PLL, drives a global clock network on the FPGA.

*PLLOUTCOREA*: Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTLGOBALA port.

*PLLOUTGLOBALB*: Output clock generated by the PLL, drives a global clock network on the FPGA.

*PLLOUTCOREB*: Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTLGOBALB port.

*LOCK*: Output port, when HIGH, indicates that the signal on PLLOUTGLOBALB/PLLOUTCOREB is locked to the PLL source on PACKAGEPIN.
**EXTFEEDBACK**: External feedback input to PLL. Enabled when the FEEDBACK_PATH parameter is set to EXTERNAL.

**DYNAMICDELAY**: 4 bit input bus that enables dynamic control of the delay contributed by the Fine Delay Adjust Block. The Fine Delay Adjust Block is used when there is a need to adjust the phase alignment of PLLOUTGLOBAL/PLLOUTCORE with respect to REFERENCECLK. The DYNAMICDELAY port controls are enabled when the DELAY_ADJUSTMENT_MODE parameter is set to DYNAMIC.

**RESETB**: Active low input that asynchronously resets the PLL.

**BYPASS**: Input signal, when asserted, connects the signal on REFERENCECLK to PLLOUTCORE/PLLOUTGLOBAL pins.

**LATCHINPUTVALUE**: Active high input, when enabled, forces the PLL into low-power mode. The PLLOUTGLOBALA/PLLOUTCOREA pins are held static at their last value only when the parameter ENABLE_ICEGATE_PORTA is set to ‘1’, and the LATCHINPUTVALUE signal is asserted. The PLLOUTGLOBALB/PLLOUTCOREB pins are held static at their last value only when the parameter ENABLE_ICEGATE_PORTB is set to ‘1’, and the LATCHINPUTVALUE signal is asserted.

**SCLK, SDI, SDO**: These pins are used only for internal testing purposes, and need not be instantiated by users.

**Parameters**
The SB_PLL40_2F_CORE primitive requires configuration through the specification of the following parameters. It is strongly recommended that the configuration of the PLL primitives be accomplished through the use of the PLL Configuration tool that is offered as part of the iCEcube2 software.

**SB_PLL40_2F_PAD**

The SB_PLL40_2F_PAD primitive should be used when the PLL is used to generate 2 different output frequencies, and the source clock of the PLL is driven by an input pad located in the bottom IO bank (IO Bank 2) or the top IO bank (IO Bank 0).

![SB_PLL40_2F_PAD Diagram]

**Ports**

**PACKAGEPIN**: PLL source clock that serves as the input to the SB_PLL40_2F_PAD primitive.

**PLLOUTGLOBALA**: Output clock generated by the PLL, drives a global clock network on the FPGA.

**PLLOUTCOREA**: Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTGLOBALA port.

**PLLOUTGLOBALB**: Output clock generated by the PLL, drives a global clock network on the FPGA.

**PLLOUTCOREB**: Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTGLOBALB port.

**LOCK**: Output port, when HIGH, indicates that the signal on PLLOUTGLOBALB/PLLOUTCOREB is locked to the PLL source on PACKAGEPIN.

**EXTFEEDBACK**: External feedback input to PLL. Enabled when the FEEDBACK_PATH parameter is set to EXTERNAL.

**DYNAMICDELAY**: 4 bit input bus that enables dynamic control of the delay contributed by the Fine Delay Adjust Block. The Fine Delay Adjust Block is used when there is a need to adjust the phase alignment of PLLOUTGLOBAL/PLLOUTCORE with respect to REFERENCECLK. The DYNAMICDELAY port controls are enabled when the DELAY_ADJUSTMENT_MODE parameter is set to DYNAMIC.

**RESETB**: Active low input that asynchronously resets the PLL.

**BYPASS**: Input signal, when asserted, connects the signal on REFERENCECLK to PLLOUTCORE/PLLOUTGLOBAL pins.
**LATCHINPUTVALUE**: Active high input, when enabled, forces the PLL into low-power mode. The PLLOUTGLOBALA/PLLOUTCOREA pins are held static at their last value only when the parameter ENABLE_ICEGATE_PORTA is set to ‘1’, and the LATCHINPUTVALUE signal is asserted. The PLLOUTGLOBALB/PLLOUTCOREB pins are held static at their last value only when the parameter ENABLE_ICEGATE_PORTB is set to ‘1’, and the LATCHINPUTVALUE signal is asserted.

**SCLK, SDI, SDO**: These pins are used only for internal testing purposes, and need not be instantiated by users.

Hard Macro Primitives

iCE40LM Hard Macros

This section describes the following dedicated hard macro primitives available in iCE40LM devices.

- SB_HSOSC (macro primitive for HSSG)
- SB_LSOSC (macro primitive for LPSG)
- SB_I2C
- SB_SPI

**SB_HSOSC (For HSSG)**

SB_HSOSC primitive can be used to instantiate High Speed Strobe Generator (HSSG), which generates 12 MHz strobe signal. The strobe can drive either the global clock network or fabric routes directly based on the clock network selection.

![SB_HSOSC Block Diagram]

<table>
<thead>
<tr>
<th>Signal Name</th>
<th>Direction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENACLKM</td>
<td>Input</td>
<td>Enable High Speed Strobe Generator. Active High.</td>
</tr>
<tr>
<td>CLKM</td>
<td>Output</td>
<td>Strobe Generator Output (12Mhz).</td>
</tr>
</tbody>
</table>

**Ports**

**Clock Network Selection**

By default the strobe generator use one of the dedicated clock networks in the device to drive the elements. The user may configure the strobe generator to use the fabric routes instead of global clock network using the synthesis attributes.

**Synthesis Attribute**

/* synthesis ROUTE_THROUGH_FABRIC=<value> */

Value:

0: Use dedicated clock network. Default option.
1: Use fabric routes.

**Verilog Instantiation**

```verilog
SB_HSOSC OSCInst0 (  .ENACLKM(ENACLKM),  .CLKM(CLKM) )  /* synthesis ROUTE_THROUGH_FABRIC= [0|1] */;
```
**SB_LSOSC (For LPSG)**

SB_LSOSC primitive can instantiate Low Power Strobe Generator (LPSG), which generates 10 KHz strobe signal. The strobe can drive either the global clock network or fabric routes directly based on the clock network selection.

![SB_LSOSC Diagram](image)

### Ports

<td>Strobe Generator Output (10Khz).</td>
</tr>
</tbody>
</table>

### Clock Network Selection

By default the strobe generator use one of the dedicated clock networks in the device to drive the elements. The user may configure the strobe generator to use the fabric routes instead of global clock network using the synthesis attribute.

#### Synthesis Attribute:

```verilog
/* synthesis ROUTE_THROUGH_FABRIC=<value> */
```

Value:

0: Use dedicated clock network. Default option.
1: Use fabric routes.

#### Verilog Instantiation

```verilog
SB_LSOSC OSCInst0 (.ENACLKK(ENACLKK), .CLKK(CLKK)) /* synthesis ROUTE_THROUGH_FABRIC= [0|1] */;
```

**SB_I2C**

The I2C hard IP provides industry standard two pin communication interface that conforms to V2.1 of the I2C bus specification. It could be configured as either master or slave port. In master mode, it support configurable data transfer rate and perform arbitration detection to allow it to operate in multi-master systems. It supports both 7 bits and 10 bits addressing in slave mode with configurable slave address and clock stretching in both master and slave mode with enable/disable capability.

iCE40LM device supports two I2C hard IP primitives, located at upper left corner and upper right corner of the chip.

SB_SPI

The SPI hard IP provide industry standard four-pin communication interface with 8 bit wide System Bus to communicate with System Host. It could be configured as Master or Slave SPI port with separate Chip Select Pin. In master mode, it provides programmable baud rate, and supports CS HOLD capability for multiple transfers. It provides variety status flags, such as Mode Fault Error flag, Transmit/Receive status flag etc. for easy communicate with system host.

iCE40LM device supports two SPI hard IP primitives, located at lower left corner and lower right corner of the chip.

**Parameters**

SPI Primitive requires configuring a parameter for selecting the SPI IP location.

**I2C Location** | **Parameters** | **Parameter Default Value.** | **Description.**
--- | --- | --- | ---
Lower Left Corner | BUS_ADDR74 | 0b0000 | Fixed value. SBADRI [7:4] bits also should match with this value to activate the IP. |
Lower Right Corner | BUS_ADDR74 | 0b0001 | Fixed value. SBADRI [7:4] bits also should match with this value to activate the IP. |

**Synthesis Attribute**

Synthesis attribute “SPI_CLK_DIVIDER” is used by PNR and STA tools for optimization and deriving the appropriate clock frequency at SCKO output with respect to the SBCLKI input clock frequency.

```c
/* synthesis SPI_CLK_DIVIDER= [Divide Range] */

Divide Range : 0, 1, 2, 3…63. Default is 0.
```
Verilog Instantiation

**iCE5LP (iCE40 Ultra) Hard Macros**

This section describes the following dedicated hard macro primitives available in iCE5LP (iCE40 Ultra) devices.

- SB_HFOSC
- SB_LFOSC
- SB_LED_DRV_CUR
- SB_RGB_DRV
- SB_IR_DRV
- SB_IO_OD
- SB_I2C
- SB_SPI
- SB_MAC16

**SB_HFOSC**

SB_HFOSC primitive generates 48MHz nominal clock frequency within +/- 10% variation, with user programmable divider value of 1, 2, 4, and 8. The HFOSC can drive either the global clock network or fabric routes directly based on the clock network selection.

**Ports**

<table>
<thead>
<tr>
<th>Signal Name</th>
<th>Direction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLKHFPU</td>
<td>Input</td>
<td>Power up the HFOSC circuit. After power up, oscillator output will be stable after 100us. Active High.</td>
</tr>
<tr>
<td>CLKHFEN</td>

</tr>
</tbody>
</table>

**Default Signal Values**

The iCEcube2 software assigns the following signal value to unconnected port:

- Input CLKHFEN: Logic "0"
- Input CLKHFPU: Logic "0"
Clock Network Selection
By default, the oscillator uses one of the dedicated clock networks in the device to drive the elements. The user may configure the oscillator to use the fabric routes instead of the global clock network using the synthesis attribute.

Synthesis Attributes

/* synthesis ROUTE_THROUGH_FABRIC = <value> */

Value:
0: Use dedicated clock network. Default option.
1: Use fabric routes.

Verilog Instantiation

SB_HFOSC OSCInst0 (  
.CLKHFEN(ENCLKHF),  
.CLKHFPU(CLKHF_POWERUP),  
.CLKHVF(CLKHF)  
) /* synthesis ROUTE_THROUGH_FABRIC= [0|1] */;

defparam OSCInst0.CLKHF_DIV = "0b00";

SB_LFOSC
SB_LFOSC primitive generates 10 KHz nominal clock frequency within +/-10% variation. There is no divider on the LFOSC. The LFOSC can drive either the global clock network or fabric routes directly based on the clock network selection.

Ports

<table>
<thead>
<tr>
<th>Signal Name</th>
<th>Direction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLKLFPU</td>
<td>Input</td>
<td>Power up the LFOSC circuit. After power up, oscillator output will be stable after 100us. Active High.</td>

<td>Output</td>
<td>LF Oscillator output.</td>
</tr>
</tbody>
</table>

Default Signal Values
The iCEcube2 software assigns the following signal value to unconnected port:
Input CLKLFEN: Logic "0"
Input CLKLFPU: Logic "0"
Clock Network Selection
By default the oscillator use one of the dedicated clock networks in the device to drive the elements. The user may configure the oscillator to use the fabric routes instead of global clock network using the synthesis attribute.

Synthesis Attributes
/* synthesis ROUTE_THROUGH_FABRIC = <value> */
Value:
0: Use dedicated clock network. Default option.
1: Use fabric routes.

Verilog Instantiation
SB_LFOSC_OSCInst1 (  
  .CLKLFEN(ENCLKLF),  
  .CLKLFPU(CLKLF_POWERUP),  
  .CLKLF(CLKLF)  
) /* synthesis ROUTE_THROUGH_FABRIC= [0|1] */;

SB_LED_DRV_CUR
SB_LED_DRV_CUR primitive generates the constant reference current required to power up the SB_RGB_DRV and SB_IR_DRV primitives.

<table>
<thead>
<tr>
<th>Signal Name</th>
<th>Direction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN</td>

<td>Output</td>
<td>Power up signal for SB_RGB_DRV and SB_IR_DRV primitives. This port should be connected only to RGBPU/IRPU pins of SB_RGB_DRV and SB_IR_DRV primitives.</td>
</tr>
</tbody>
</table>

Default Signal Values
The iCEcube2 software assigns the following signal value to unconnected port:
Input EN : Logic “0”
Verilog Instantiation

```verilog
SB_LED_DRV_CUR      LED_CUR_inst
  ( .EN(enable_led_current),
    .LEDPU(led_power_up)
  );
```

**SB_RGB_DRV**

SB_RGB_DRV primitive contains 3 dedicated open drain I/O pins for RGB LED outputs. Each of the RGB LED output is bonded out together with an SB_IO_OD primitive to the package pin. User can either use SB_RGB_DRV primitive or the SB_IO_OD primitive to drive the package pin, but not both.

The primitive allows configuration of each of the 3 RGB LED outputs individually. When the RGBx_CURRENT parameter of RGBx output is set to "0b000000", then SB_IO_OD can be used to drive the package pin.

### Ports

<table>
<thead>
<tr>
<th>Signal Name</th>

<td>RGB2 LED output.</td>
</tr>
</tbody>
</table>

### Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

- Input RGBLEDEN : Logic "0"
- Input RGB0PWM : Logic "0"
- Input RGB1PWM : Logic "0"
Input RGB2PWM : Logic “0”
Input RGBPU    : Logic “0”

Parameters
The SB_RGB_DRV primitive contains the following parameter and their default values:

Parameter RGB0_CURRENT = “0b0000000”;
Parameter RGB1_CURRENT = “0b0000000”;
Parameter RGB2_CURRENT = “0b0000000”;

Parameter values:
"0b0000000" = 0mA.  // Set this value to use the associated SB_IO_OD instance at RGB
// LED location.
"0b0000001" = 4mA.
"0b0000011" = 8mA.
"0b0000111" = 12mA.
"0b0001111" = 16mA.
"0b0111111" = 20mA.
"0b1111111" = 24mA.

Verilog Instantiation
SB_RGB_DRV RGB_DRIVER (  
  .RGBLEDEN(ENABLE_LED),  
  .RGB0PWM(RGB0),      
  .RGB1PWM(RGB1),      
  .RGB2PWM(RGB2),      
  .RGBPU(led_power_up),  
  .RGB0(LED0),        
  .RGB1(LED1),        
  .RGB2(LED2)
);  
defparam RGB_DRIVER.RGB0_CURRENT = “0b1111111”;  
defparam RGB_DRIVER.RGB1_CURRENT = “0b1111111”;  
defparam RGB_DRIVER.RGB2_CURRENT = “0b1111111”;

SB_IR_DRV
SB_IR_DRV primitive contains a single dedicated open drain I/O pin for IRLED output. The IRLED output is bonded out together with an SB_IO_OD primitive to the package pin. User can either use SB_IR_DRV primitive or the SB_IO_OD primitive to drive the package pin, but not both.

When the IR_CURRENT parameter is set to “0b0000000000”, then SB_IO_OD can be used to drive the package pin.
## Ports

<table>
<thead>
<tr>
<th>Signal Name</th>
<th>Direction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IRLEDEN</td>
<td>Input</td>
<td>Enable the SB_IR_DRV primitive. Active High.</td>
</tr>
<tr>

<td>Input</td>
<td>Power Up Signal. Connect to LEDPU port of SB_LED_DRV_CUR primitive.</td>
</tr>
<tr>
<td>IRPWM</td>
<td>Input</td>
<td>PWM Input data to drive IRLED pin.</td>
</tr>
<tr>
<td>IRLED</td>
<td>Output</td>
<td>IR LED output.</td>
</tr>
</tbody>
</table>

### Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input IRLEDEN : Logic "0"
Input IRPWM : Logic "0"

### Parameter

The SB_IR_DRV primitive contains the following parameter and their default values:

Parameter IR_CURRENT = "0b00000000000";

Parameter Values:

- "0b00000000000"; = 0mA: // Set this value to use the associated SB_IO_OD instance at IR LED location.
- "0b00000000001"; = 50mA
- "0b00000000011"; = 100mA
- "0b00000000111"; = 150mA
- "0b00000001111"; = 200mA
- "0b00000111111"; = 250mA
- "0b00001111111"; = 300mA
- "0b00011111111"; = 350mA
- "0b01111111111"; = 400mA
- "0b11111111111"; = 450mA
- "0b11111111111"; = 500mA

### Verilog Instantiation

```
SB_IR_DRV  IRDRVinst (  
   .IRLEDEN(ENABLE_IRLED),  
   .IRPWM(IR_INPUT),  
   .IRPU(led_power_up),  
   .IRLED(IR_LED)  
);

defparam IRDRVinst.IR_CURRENT = "0b11111111111";
```
**SB_RGB_IP**

SB_RGB_IP primitive generates the 3 RGB PWM outputs, to be connected to the LED drivers.

### Ports

<table>
<thead>
<tr>
<th>Signal Name</th>
<th>Direction</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<td>GREEN PWM output.</td>
</tr>
<tr>
<td>BLUEPWM</td>
<td>Output</td>
<td>BLUE PWM output.</td>
</tr>
</tbody>
</table>

### Default Signal Values

The iCEcube2 software assigns the logic “0” value to all unconnected input ports.

### Verilog Instantiation

```verilog
SB_RGB_IP RGBPWMIP_inst(
    .CLK (CLK),
    .RST (RST), // Async rst
    .PARAMSOK (PARAMSOK),
    .RGBCOLOR (RGBCOLOR),
    .BRIGHTNESS (BRIGHTNESS),
    .BREATHRAMP (BREATHRAMP),
    .BLINKRATE (BLINKRATE),
    .REDPWM (REDPWM),
    .GREENPWM (GREENPWM),
    .BLUEPWM (BLUEPWM)
);
```
**SB_IO_OD**

The SB_IO_OD is the open drain IO primitive. When the Tristate output is enabled, the IO pulls down the package pin signal to zero. The following figure and Verilog template illustrate the complete user accessible logic diagram, and its Verilog instantiation.

![Logic Diagram](image)

### Ports

<table>
<thead>
<tr>
<th>Signal Name</th>
<th>Direction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>DIN0</td>
<td>Output</td>
<td>Data from package pin.</td>
</tr>
<tr>
<td>DIN1</td>
<td>Output</td>
<td>Data from package pin.</td>
</tr>
</tbody>
</table>
Default Signal Values

The iCEcube2 software assigns the logic “0” value to all unconnected input ports except for CLOCKENABLE. Note that explicitly connecting logic “1” value to port CLOCKENABLE will result in a non-optimal implementation, since extra LUT will be used to generate the Logic “1”. If the user’s intention is to keep the Input and Output registers always enabled, it is recommended that port CLOCKENABLE to be left unconnected.

Parameter Values

Parameter PIN_TYPE = 6'b000000;
// See Input and Output Pin Function Tables in SB_IO.
// Default value of PIN_TYPE = 6'b000000
Parameter NEG_TRIGGER = 1'b0;
// Specify the polarity of all FFs in the I/O to be falling edge when NEG_TRIGGER = 1. Default is 1'b0, rising edge.

Input and Output Pin Function Tables

Refer SB_IO Input and Output Pin Functional Table for the PIN_TYPE settings. Some of the output pin configurations are not applicable for SB_IO_OD primitive.

Verilog Instantiation

SB_IO_OD   OpenDrainInst0
(    // User's Pin signal name
   .PACKAGEPIN (PackagePin),   // Latches/holds the Input value
   .LATCHINPUTVALUE (latchinputvalue),   // Clock Enable common to input and output clock
   .CLOCKENABLE (clockenable),
   .INPUTCLK (inputclk),   // Clock for the input registers
   .OUTPUTCLK (outputclk),   // Clock for the output registers
   .OUTPUTENABLE (outputenable),   // Output Pin Tristate/Enable control
   .DOUT0 (dout0),   // Data 0 - out to Pin/Rising clk edge
   .DOUT1 (dout1),   // Data 1 - out to Pin/Falling clk edge
   .DIN0 (din0),   // Data 0 - Pin input/Rising clk edge
   .DIN1 (din1)    // Data 1 - Pin input/Falling clk edge
);
defparam OpenDrainInst0.PIN_TYPE = 6'b000000;
defparam OpenDrainInst0.NEG_TRIGGER = 1'b0;
**SB_I2C**

iCE5LP device supports two I2C hard IP primitives, located at upper left corner and upper right corner of the chip.

![Diagram of SB_I2C](image)

**Ports**

The port interface is similar as iCE40LM SB_I2C primitive. Refer Page 113.

**Parameters**

The parameters are same as ICE40LM SB_I2C primitive.

**Synthesis Attribute**

**I2C_CLK_DIVIDER**

Synthesis attribute "I2C_CLK_DIVIDER" is used by PNR and STA tools for optimization and deriving the appropriate clock frequency at SCLO output with respect to the SBCLKI input clock frequency.

/* synthesis I2C_CLK_DIVIDER= Divide Value */

Divide Value: 0, 1, 2, 3 … 1023. Default is 0.

**SDA_INPUT_DELAYED**

SDA_INPUT_DELAYED attribute is used to add 50ns additional delay to the SDAI signal.

/* synthesis SDA_INPUT_DELAYED= value */

Value:
0: No delay.
1: Add 50ns delay. (Default value).

**SDA_OUTPUT_DELAYED**

SDA_OUTPUT_DELAYED attribute is used to add 50ns additional delay to the SDAO signal.

/* synthesis SDA_OUTPUT_DELAYED= value */

Value:
0: No delay (Default value).
1: Add 50ns delay.

**SB_SPI**

iCE5LP device supports two SPI hard IP primitives, located at lower left corner and lower right corner of the chip. The port interface of SB_SPI is similar as ICE40LM SB_SPI primitive. Refer Page 116.

![SB_SPI Diagram](image)

Ports

The port interface is similar as iCE40LM SB_SPI primitive. Refer Page 116.

Parameters

The parameters are same as ICE40LM SB_SPI primitive.

Synthesis Attribute

The synthesis attribute is same as ICE40LM SB_SPI primitive.
**SB_MAC16**

The SB_MAC16 primitive is the dedicated configurable DSP block available in iCE5LP devices. The SB_MAC16 can be configured into a multiplier, adder, subtracter, accumulator, multiply-add and multiply-sub through the instance parameters. The SB_MAC16 blocks can be cascaded to implement wider functional units.

iCEcube2 supports a set of predefined SB_MAC16 functional configurations. Refer Page 137 for the list of supported configurations.
SB_MAC16 Functional Model

**Parameters**

The parameter table below shows the list of parameters to configure the SB_MAC16 block. This table also maps the parameter to the configuration bits shown in the SB_MAC16 Functional diagram.
<table>
<thead>
<tr>
<th>Function</th>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PIPELINE\textunderscore 16x16\textunderscore MULT\textunderscore REG1</td>
<td>C6</td>
<td>Intermediate 8x8 multiplier pipeline register controls (points J and K). These multipliers are only used for 16x16 multiply operations. For 8x8 multiply operations, set C6 and C7 to 1, which reduces power consumption.</td>
</tr>
<tr>
<td>PIPELINE\textunderscore 16x16\textunderscore MULT\textunderscore REG2</td>
<td>C7</td>
<td>16x16 multiplier Pipeline registers control. (point H)</td>
</tr>
<tr>
<td>TOPOUTPUT\textunderscore SELECT</td>
<td>C9,C8</td>
<td>Selects Top SB\textunderscore MAC16 output O[31:16].</td>
</tr>
<tr>
<td>TOPADDSUB\textunderscore LOWERINPUT</td>
<td>C11,C10</td>
<td>Selects input X for the upper adder/subtractor</td>
</tr>
<tr>
<td>TOPADDSUB\textunderscore UPPERINPUT</td>
<td>C12</td>
<td>Selects input W for the upper adder/subtractor</td>
</tr>
<tr>
<td>TOPADDSUB\textunderscore CARRYSELECT</td>
<td>C14,C13</td>
<td>Carry/borrow input select to upper adder/subtractor.</td>
</tr>
<tr>
<td>BOTOUTPUT\textunderscore SELECT</td>
<td>C16,C15</td>
<td>Selects Lower SB\textunderscore MAC16 output O[15:0].</td>
</tr>
<tr>
<td>Function</td>
<td>Bits</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>----------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>BOTADDSUB_LOWERINPUT</td>
<td>C18,C17</td>
<td>Selects Input Z for the lower adder/subtractor</td>
</tr>
<tr>
<td></td>
<td>00</td>
<td>16-bit input from B input or associated pipeline register</td>
</tr>
<tr>
<td></td>
<td>01</td>
<td>16-bit output from lower 8x8 multiplier, G</td>
</tr>
<tr>
<td></td>
<td>10</td>
<td>Lower 16-bit output from 16x16 multiplier, H</td>
</tr>
<tr>
<td></td>
<td>11</td>
<td>Sign extension input SIGNEXTIN. Duplicate 16 bits.</td>
</tr>
<tr>
<td>BOTADDSUB_UPPERINPUT</td>
<td>C19</td>
<td>Selects Input Y for the lower adder/subtractor</td>
</tr>
<tr>
<td></td>
<td>0</td>
<td>16-bit feedback from lower accumulator register, S</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>16-bit input from D input or associated input register.</td>
</tr>
<tr>
<td>BOTADDSUB_CARRYSELECT</td>
<td>C21,C20</td>
<td>Carry/borrow input select to lower adder/subtractor</td>
</tr>
<tr>
<td></td>
<td>00</td>
<td>Constant 0</td>
</tr>
<tr>
<td></td>
<td>01</td>
<td>Constant 1</td>
</tr>
<tr>
<td></td>

<td>Cascade Carry/borrow input from ACCUMCI</td>
</tr>
<tr>
<td></td>
<td>11</td>
<td>Carry/borrow input from CI</td>
</tr>
<tr>
<td>MODE_8x8</td>
<td>C22</td>
<td>Selects 8x8 Multiplier mode and 8x8 Low-Power Multiplier Blocking Option</td>
</tr>
<tr>
<td></td>
<td>0</td>
<td>No effect</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Selects 8x8 Multiplier mode. Holds the pipelining registers associate with a 16x16 multiplier in clock disable mode. Helps reduce the dynamic power consumption within the multiplier function. Used in conjunction with C6, C7 settings.</td>
</tr>
<tr>
<td>A_SIGNED</td>
<td>C23</td>
<td>Indicates whether multiplier input A is signed or unsigned. Applies regardless if input A is 16- or 32-bits wide.</td>
</tr>
<tr>
<td></td>
<td>0</td>
<td>Multiplier input A is unsigned.</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Multiplier input A is signed.</td>
</tr>
<tr>
<td>B_SIGNED</td>
<td>C24</td>
<td>Indicates whether multiplier input B is signed or unsigned. Applies regardless if input B is 16- or 32-bits wide.</td>
</tr>
<tr>
<td></td>
<td>0</td>
<td>Multiplier input B is unsigned.</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Multiplier input B is signed.</td>
</tr>
</tbody>
</table>
SB_MAC16 Configurations

The following SB_MAC16 functional blocks are supported in iCEcube2.

1. Multiplier.
2. Multiply and Accumulate (MAC).
3. Accumulator (ACC).
4. Add/Subtract (ADD/SUB).
5. Multiply and Add/Subtract (MULTADDSUB)

The valid configuration parameter settings for each functional block are listed below.

Device Configuration Primitives

**SB_WARMBOOT**

iCE FPGA devices permit the user to load a different configuration image during regular operation. Through the use of the Warm Boot Primitive, the user can load one of 4 pre-defined configuration images into the iCE FPGA device.

*Note that this Warm Boot mode is different from the Cold Boot operation, which is executed during the initial device boot-up sequence.*

```
SB_WARMBOOT my_warmboot_i (  
  .BOOT (my_boot),       // Level-sensitive trigger signal  
  .S1 (my_sel1),        // S1, S0 specify selection of the  
  .S0 (my_sel0)         // configuration image  
);
```

The selection of one of these 4 images is accomplished through 2 input signals, S1 and S0. In order to trigger the selection of a new image, an additional signal, BOOT, is provided. It should be noted that this signal is level-triggered, and should be used for every Warm Boot operation i.e. every time the user wishes to load a new image into the device.

The successful instantiation of this primitive also requires the user to specify the address locations of the 4 images. These addresses should be specified in the iCEcube2 software as per the Warm Boot Application Note.
