## Acronyms in This Document

A list of acronyms used in this document.

| Acronym | Definition                    |
|---------|-------------------------------|
| WDT     | Watchdog Timer                |
| NMI     | Non-Maskable Interrupt        |
| FPGA    | Field Programmable Gate Array |
| RTL     | Register Transfer Level       |

# 1. Introduction

The Watchdog Timer IP Core is designed for use as an indicator that a corrective action is needed in response to a computer or a processor malfunction. The design features a two-stage timer which supports non-maskable interrupt and a hard reset.

This design is implemented in Verilog. It can be targeted to CrossLink-NX™ FPGA devices and implemented using the Lattice Radiant® Software Place and Route tool integrated with the Synplify Pro® synthesis tool.

## 1.1. Quick Facts

Table 1.1 presents a summary of the Watchdog Timer IP Core.

## 1.2. Features

Key features of the Watchdog Timer IP Core include:

- Seamlessly work with sleep mode
- Programmable timer spec 50-500 ms (10 ms)
- Two-stage timer that supports warm boot and cold boot resets
- You can specify in cycles or time
- Supports trigger input, reset and NMI output

## 1.3. Conventions

### 1.3.1. Nomenclature

The nomenclature used in this document is based on Verilog HDL.

### 1.3.2. Signal Names

Signal Names that end with:

- *\_n* are active low
- *\_i* are input signals
- *\_o* are output signals

### 1.3.3. Attribute

The names of attributes in this document are formatted in title case and italicized (*Attribute Name*).

## 2. Functional Descriptions

### 2.1. Overview

The Watchdog Timer IP Core performs the following functions:

- Send a non-maskable interrupt to the computer (nmi\_o)
- Send a reset to the computer for system restart (reset\_o)

WDT IP Core is a two-stage timer that will start to count depending on the computer status. The computer continuously sends a kick signal to the watchdog timer as its status, absence of the kick signal means there is a hardware malfunction or program error in the computer.

The Watchdog Timer IP Core uses an up-counter that counts from zero to a timeout value at a rate that is determined by the configurable mode and the clock frequency.

#### 2.1.1. Watchdog Timer Modes

##### Cycle

When in cycle mode, the user can configure the timeout in terms of the number of cycles for each stage of timer. The number of cycle refers to the count needed by the watchdog timer to reach in order to assert the timeout signal.

##### Time

Using the time mode, the user can configure the timeout in milliseconds and the clock frequency ranging from 10kHz to 150 MHz.

##### Reset ports

The Watchdog Timer IP Core supports both warm boot (nmi\_o) and cold boot (reset\_o) resets. Reset ports will be asserted once the timeout value is reached. The warm boot reset is a non-maskable interrupt which serves as a warning to the computer that a system reset is expected. When this port is asserted, the computer should either debug the program error or store the important files in running programs. The cold boot or the hard reset, as the name implies, will reset the whole system once the second timeout value has reached.

Figure 2.1 shows a functional diagram for the Watchdog Timer IP Core.

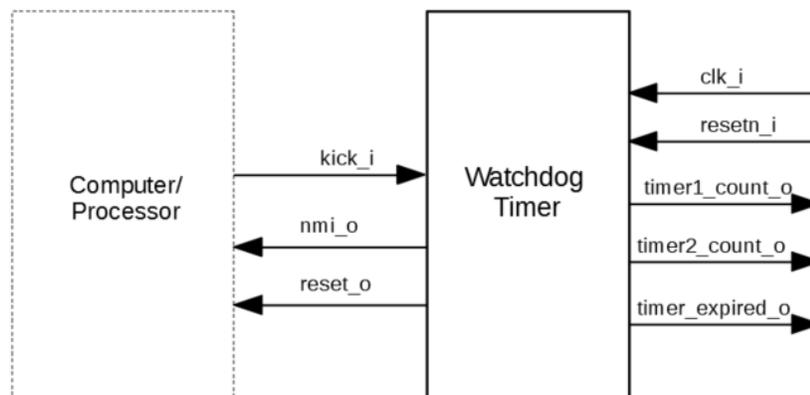

Figure 2.1. Functional Block Diagram

## 2.2. Signal Description

**Table 2.1. Watchdog Timer IP Core Signal Description**

| Port Name              | I/O | Width | Description   |
|------------------------|-----|-------|---|
| <b>Clock and Reset</b> |     |       |   |
| clk_i                  | In  | 1     | System clock.   |
| resetn_i               | In  | 1     | Active low reset.   |
| reset_o                | Out | 1     | Cold boot output reset  |
| <b>Interrupt Port</b>  |     |       |   |
| nmi_o                  | Out | 1     | Non-maskable interrupt signal.  |
| <b>WDT Ports</b>       |     |       |   |
| kick_i                 | In  | 1     | Kick signal connected from an external computer/processor.  |
| timer1_count_o         | Out | 25    | Up counter for Timer Stage 1  |
| timer2_count_o         | Out | 25    | Up counter for Timer Stage 2  |
| timer_expired_o        | Out | 1     | Timer Expiration bit.<br>1'b0 – watchdog timer is still counting<br>1'b1 – watchdog timer count expires |

## 2.3. Attribute Summary

The configurable attributes of the Watchdog Timer IP Core are shown in [Table 2.2](#) and are described in [Table 2.3](#). The attributes can be configured through the IP Catalog's Module/IP wizard of the Lattice Radiant Software.

**Table 2.2. Attributes Table**

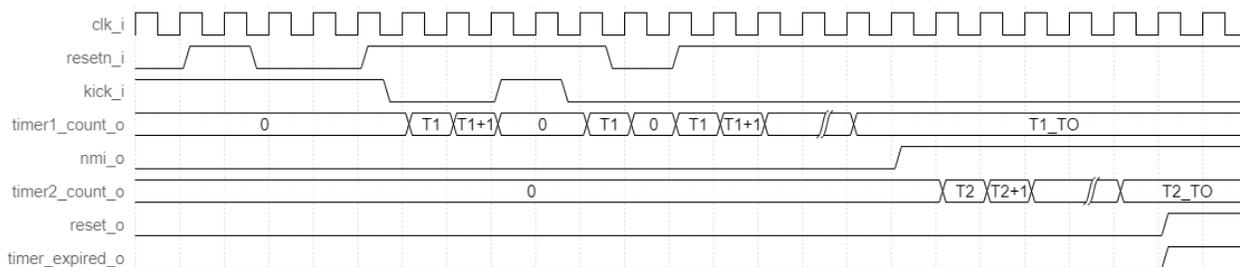

| Attribute                     | Selectable Values     | Default | Dependency on Other Attributes   |
|-------------------------------|-----------------------|---------|--|
| <b>General</b>                |                       |         |  |
| Mode                          | ("Cycle", "Time")     | "Cycle" | —  |
| Frequency Unit                | ("kHz", "MHz")        | "MHz"   | Active if <i>Watchdog Timer Mode</i> == Time   |
| System Clock Frequency        | (10, 999),<br>(1,150) | 100     | Active if <i>Watchdog Timer Mode</i> == Time, else will use the testbench clock frequency provided by the user. Selectable values are dependent on <i>Frequency Unit</i> |
| <b>Timer Stage 1</b>          |                       |         |  |
| Timeout (number of cycles)    | (500, 75000000)       | 5000    | Active if <i>Watchdog Timer Mode</i> == Cycle  |
| Timeout (ms)                  | (50, 500)             | 50      | Active if <i>Watchdog Timer Mode</i> == Time   |
| <b>Timer Stage 2</b>          |                       |         |  |
| Timeout (number of cycles)    | (500, 75000000)       | 5000    | Active if <i>Watchdog Timer Mode</i> == Cycle  |
| Timeout (ms)                  | (50, 500)             | 50      | Active if <i>Watchdog Timer Mode</i> == Time   |
| <b>Calculated</b>             |                       |         |  |
| Timeout S1 (number of cycles) | N/A                   | N/A     | —  |
| Timeout S2 (number of cycles) | N/A                   | N/A     | —  |

**Table 2.3. Attributes Descriptions**

| Attribute                     | Description   |
|-------------------------------|---|
| <b>General</b>                |   |
| Mode                          | Specifies the Watchdog Timer Mode.  |
| Frequency Unit                | Specifies the unit for <i>System Clock Frequency</i> .  |
| System Clock Frequency        | Specifies the user clock frequency.   |
| <b>Timer Stage 1</b>          |   |
| Timeout (number of cycles)    | Specifies the timeout of Timer Stage 1 in terms of number of cycles when the selected <i>Mode</i> is Cycle. |
| Timeout (ms)                  | Specifies the timeout of Timer Stage 1 in terms of ms.  |
| <b>Timer Stage 2</b>          |   |
| Timeout (number of cycles)    | Specifies the timeout of Timer Stage 2 in terms of number of cycles when the selected <i>Mode</i> is Cycle. |
| Timeout (ms)                  | Specifies the timeout of Timer Stage 2 in terms of ms.  |
| <b>Calculated</b>             |   |
| Timeout S1 (number of cycles) | Specifies the calculated number of cycles for Timer Stage 1 when the selected <i>Mode</i> is Time.          |
| Timeout S2 (number of cycles) | Specifies the calculated number of cycles for Timer Stage 2 when the selected <i>Mode</i> is Time.          |

## 2.4. Timing Diagrams

During normal operation, the connected computer/processor regularly sends a “kick” signal to the watchdog timer using `kick_i` port. When the kick of computer suddenly stopped, timer stage 1 will begin to count. Timer Stage 1 will eventually equal to the timeout value which will assert the `nmi_o` port. This port will trigger the counting of Timer Stage 2 and simultaneously notify the computer by means of the warm boot (`nmi_o`) that a reset is imminent. After the Timer Stage 2 times out, cold boot (`reset_o`) will assert which will forcefully restart the computer. See [Figure 2.2](#) for a sample Watchdog Timer timing diagram.

**Figure 2.2. Timing Diagram**

### 3. IP Generation and Evaluation

This section provides information on how to generate the Watchdog Timer IP Core using the Lattice Radiant Software and how to run simulation and synthesis. For more details on the Lattice Radiant Software, refer to the [Lattice Radiant Software 2.0 User Guide](#).

#### 3.1. Licensing the IP

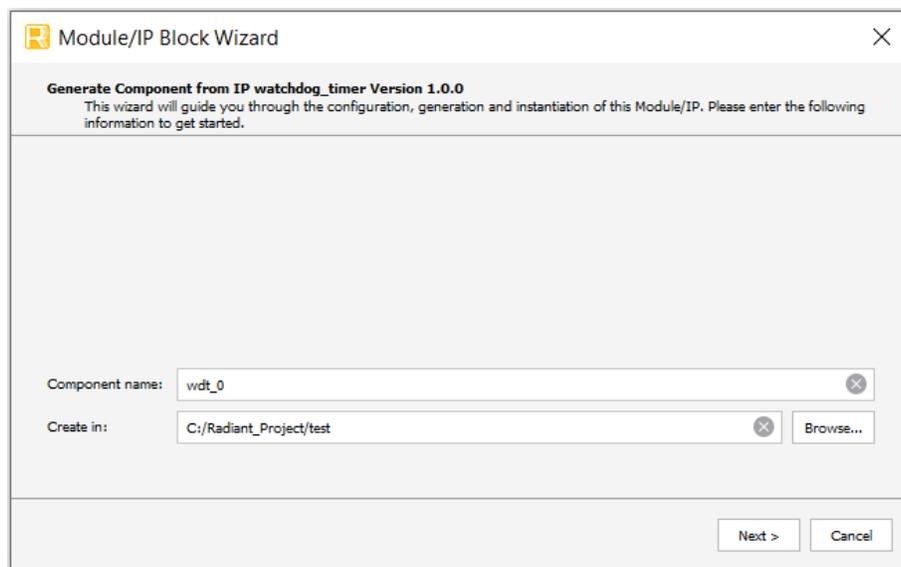

An IP core-specific license string is required enable full use of the Watchdog Timer IP Core in a complete, top-level design. You can fully evaluate the IP core through functional simulation and implementation (synthesis, map, place and route) without an IP license string. This IP core supports Lattice’s IP hardware evaluation capability, which makes it possible to create versions of the IP core, which operate in hardware for a limited time (approximately four hours) without requiring an IP license string. See Hardware Evaluation section for further details. However, a license string is required to enable timing simulation and to generate bitstream file that does not include the hardware evaluation timeout limitation.

#### 3.2. Generation and Synthesis

The Lattice Radiant Software allows you to customize and generate modules and IPs and integrate them into the device’s architecture. The procedure for generating the Watchdog Timer IP Core in Lattice Radiant Software is described below.

To generate the Watchdog Timer IP Core:

1. Create a new Lattice Radiant Software project or open an existing project.
2. In the **IP Catalog** tab, double-click on **Watchdog\_Timer** under **IP, Processors\_Controllers\_and\_Peripherals** category. The **Module/IP Block Wizard** opens as shown in [Figure 3.1](#). Enter values in the **Instance name** and the **Create in** fields and click **Next**.

**Figure 3.1. Module/IP Block Wizard**

3. In the module’s dialog box of the **Module/IP Block Wizard** window, customize the selected Watchdog Timer IP Core using drop-down menus and check boxes. As a sample configuration, see [Figure 3.2](#) For configuration options, see the [Attribute Summary](#) section.

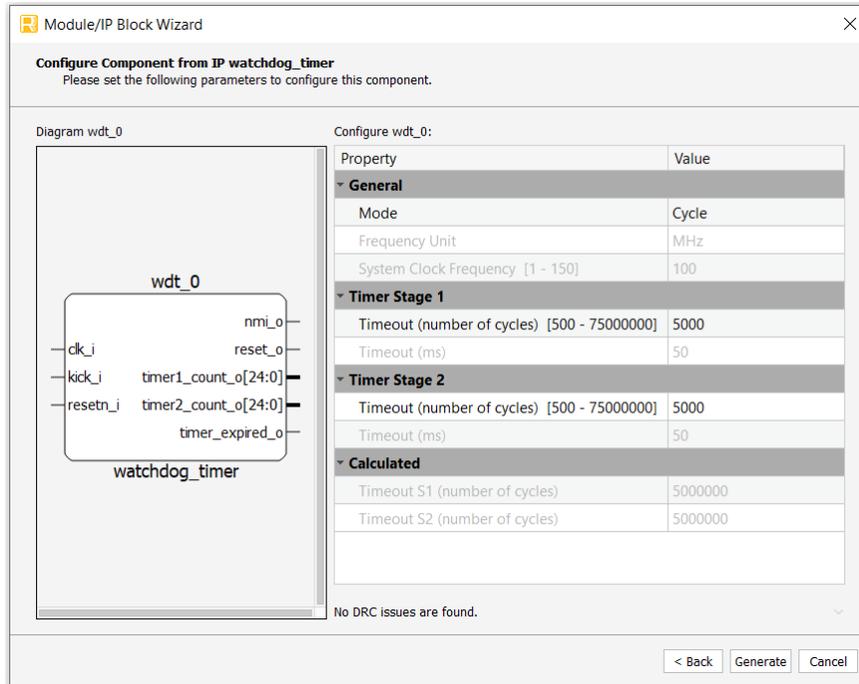

Figure 3.2. Configure User Interface of Watchdog Timer IP Core

- Click **Generate**. The **Check Generating Result** dialog box opens, showing design block messages and results as shown in Figure 3.3.

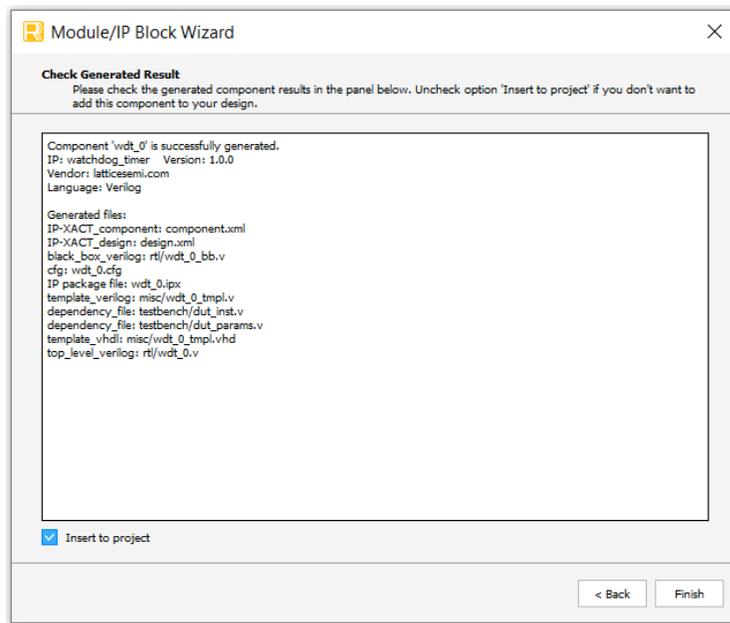

Figure 3.3. Check Generating Result

- Click the **Finish** button. All the generated files are placed under the directory paths in the **Create in** and the **Instance name** fields shown in Figure 3.1.

The generated Watchdog Timer IP Core package includes the black box (<Instance Name>\_bb.v) and instance templates (<Instance Name>\_tmpl.v/vhd) that can be used to instantiate the core in a top-level design. An example RTL top-level reference source file (<Instance Name>.v) that can be used as an instantiation template for the IP core is also provided. You may also use this top-level reference as the starting template for the top-level for their complete design. The generated files are listed in [Table 3.1](#).

**Table 3.1. Generated File List**

| Attribute   | Description   |
|---|---|
| <Instance Name>.ipx   | This file contains the information on the files associated to the generated IP. |
| <Instance Name>.cfg   | This file contains the parameter values used in IP configuration.               |
| component.xml   | Contains the ipxact:component information of the IP.                            |
| design.xml  | Documents the configuration parameters of the IP in IP-XACT 2014 format.        |
| rtl/<Instance Name>.v   | This file provides an example RTL top file that instantiates the IP core.       |
| rtl/<Instance Name>_bb.v                                      | This file provides the synthesis black box.                                     |
| misc/<Instance Name>_tmpl.v<br>misc /<Instance Name>_tmpl.vhd | These files provide instance templates for the IP core.                         |

### 3.3. Running Functional Simulation

Running functional simulation can be performed after the IP is generated. The following steps can be performed.

1. Click the  button located on the **Toolbar** to initiate the **Simulation Wizard** shown in [Figure 3.4](#).

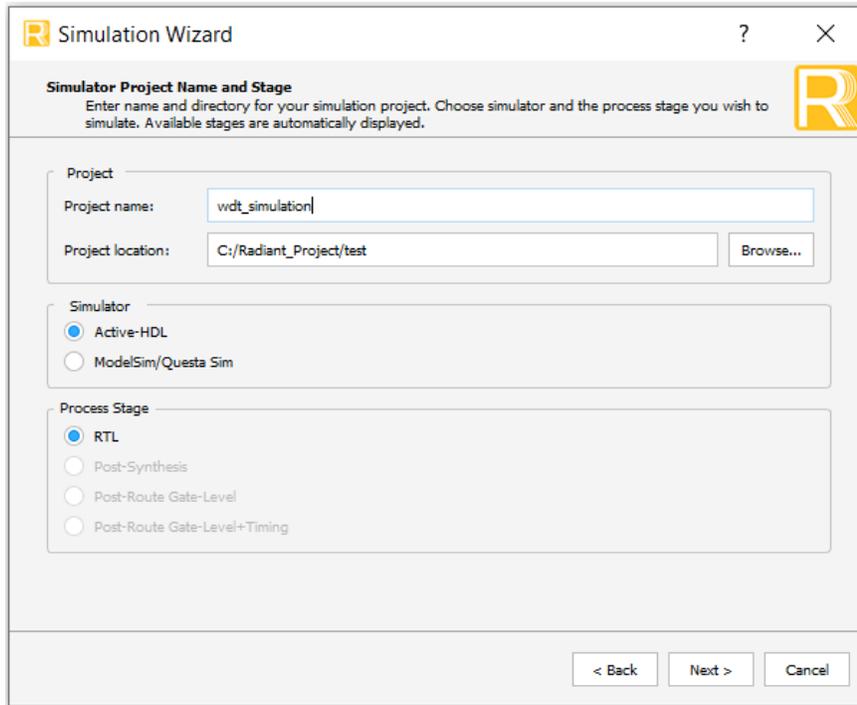

Figure 3.4. Simulation Wizard

1. Click **Next** to open the **Add and Reorder Source** window as shown in [Figure 3.5](#).

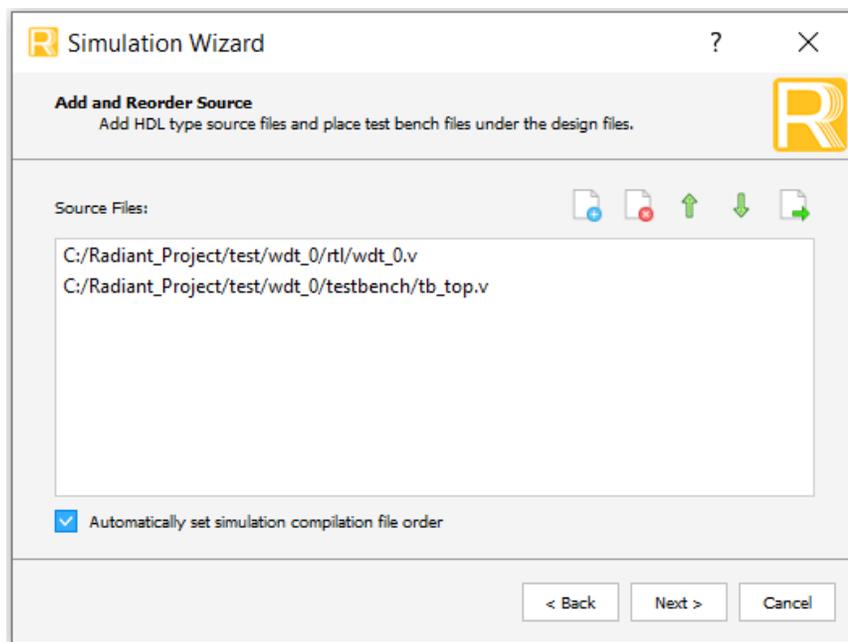

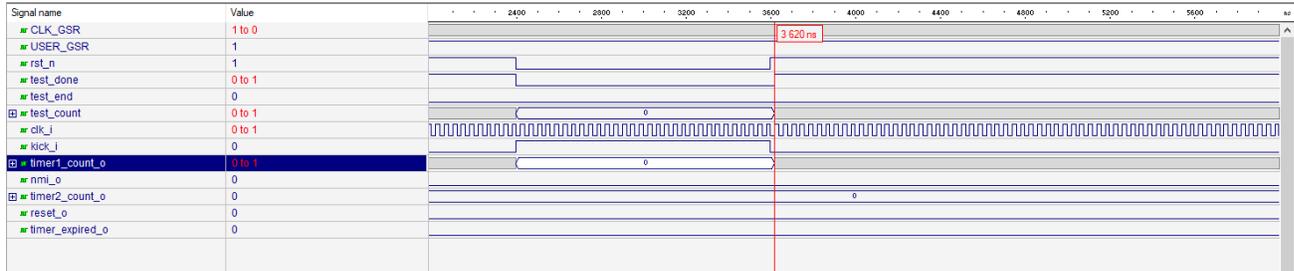

Figure 3.5. Adding and Reordering Source

2. Click **Next**. The Summary window is shown. Click **Finish** to run the simulation.

**Note:** It is necessary to follow the procedure above until it is fully automated in the Lattice Radiant Software Suite. The results of the simulation in our example are provided in [Figure 3.6](#).

**Figure 3.6. Simulation Waveform**

### 3.4. Hardware Evaluation

The Watchdog Timer IP Core supports Lattice’s IP hardware evaluation capability when used with LIFCL devices. This makes it possible to create versions of the IP core that operate in hardware for a limited period of time (approximately four hours) without requiring the purchase of an IP license. It may also be used to evaluate the core in hardware in user-defined designs. The hardware evaluation capability may be enabled/disabled in the Strategy dialog box. It is enabled by default. To change this setting, go to Project > Active Strategy > LSE/Synplify Pro Settings.

## Technical Support Assistance

Submit a technical support case through [www.latticesemi.com/techsupport](http://www.latticesemi.com/techsupport).

## Appendix A. Resource Utilization

Table A.1 shows the resource utilization of the Watchdog Timer IP Core for the LIFCL-40 device, using Lattice Synthesis Engine of Lattice Radiant Software. Default configuration is used and some attributes are changed from the default value to show the effect on the resource utilization.

**Table A.1. Resource Utilization**

| Configuration   | Slice Registers | LUTs | EBRs |
|---|-----------------|------|------|
| Default   | 52              | 116  | 0    |
| Timer Stage 1 <i>Timeout</i> = 1050, Others = Default                   | 52              | 117  | 0    |
| <i>Mode Time</i> , <i>Clock Frequency</i> = 100, Others = Default       | 52              | 128  | 0    |
| <i>Mode Time</i> , Timer Stage 2 <i>Timeout</i> = 100, Others = Default | 52              | 126  | 0    |

**\*Note:** Fmax is generated when the FPGA design only contains Watchdog Timer IP Core. These values may be reduced when user logic is added to the FPGA design.
