1.0 INTRODUCTION

Lattice ispPAC-POWR devices provide highly accurate, flexible, and low cost solutions for circuit board power supply and processor/DSP supply management. By integrating a versatile PLD core with Analog-to-Digital (ADC) converter, Digital-to-Analog Converters (DAC), differential sense analog monitors, I2C communication, and in-system programmability (isp), Lattice power management devices increase board reliability, decrease component count, and help cut costs. Two power management families: ProcessorPM and Power Manager II address a variety of applications – all in a single low-cost chip.

The ispPAC-POWR product family is built on EE8A which is a 3.3V shallow trench isolated, 0.35um drawn/0.25um Leff CMOS process with Electrically Erasable (E2) cells. This process uses three planarized metal interconnect layers and single layer polysilicon fabricated at either United Microelectronics Company (UMC) wafer fab, or Epson wafer fab at Sakata, and assembled at Advance Semiconductor Engineering Malaysia (ASEM), Amkor Korea and UNISEM Group Singapore, in TQFP and QFNS packages. To verify product reliability, Lattice Semiconductor maintains an active Early Life and Inherent Life Reliability Monitor program on the ispPAC-POWR products. Lattice Semiconductor publishes the Reliability Monitor Data quarterly.

2.0 LATTICE PRODUCT QUALIFICATION PROGRAM

Lattice Semiconductor Corp. maintains a comprehensive reliability qualification program to assure that each product achieves its reliability goals. After initial qualification, the continued high reliability of Lattice products is assured through ongoing monitor programs as described in Reliability Monitor Program Procedure (Doc. #101667). All product qualification plans are generated in conformance with Lattice Semiconductor's Qualification Procedure (Doc. #100164) with failure analysis performed in conformance with Lattice Semiconductor's Failure Analysis Procedure (Doc. #100166). Both documents are referenced in Lattice Semiconductor's Quality Assurance Manual, which can be obtained upon request from a Lattice Semiconductor sales office or downloaded from the lattice website at www.latticesemi.com. Figure 2.1 shows the Product Qualification Process Flow.

If failures occur during qualification, an 8-Discipline (8D) process is used to find root cause and eliminate the failure mode from the design, materials, or process. The effectiveness of any fix or change is validated through additional testing as required. Final testing results are reported in the qualification reports.

Failure rates in this reliability report are expressed in FITS. Due to the very low failure rate of integrated circuits, it is convenient to refer to failures in a population during a period of 10^9 device hours; one failure in 10^9 device hours is defined as one FIT.

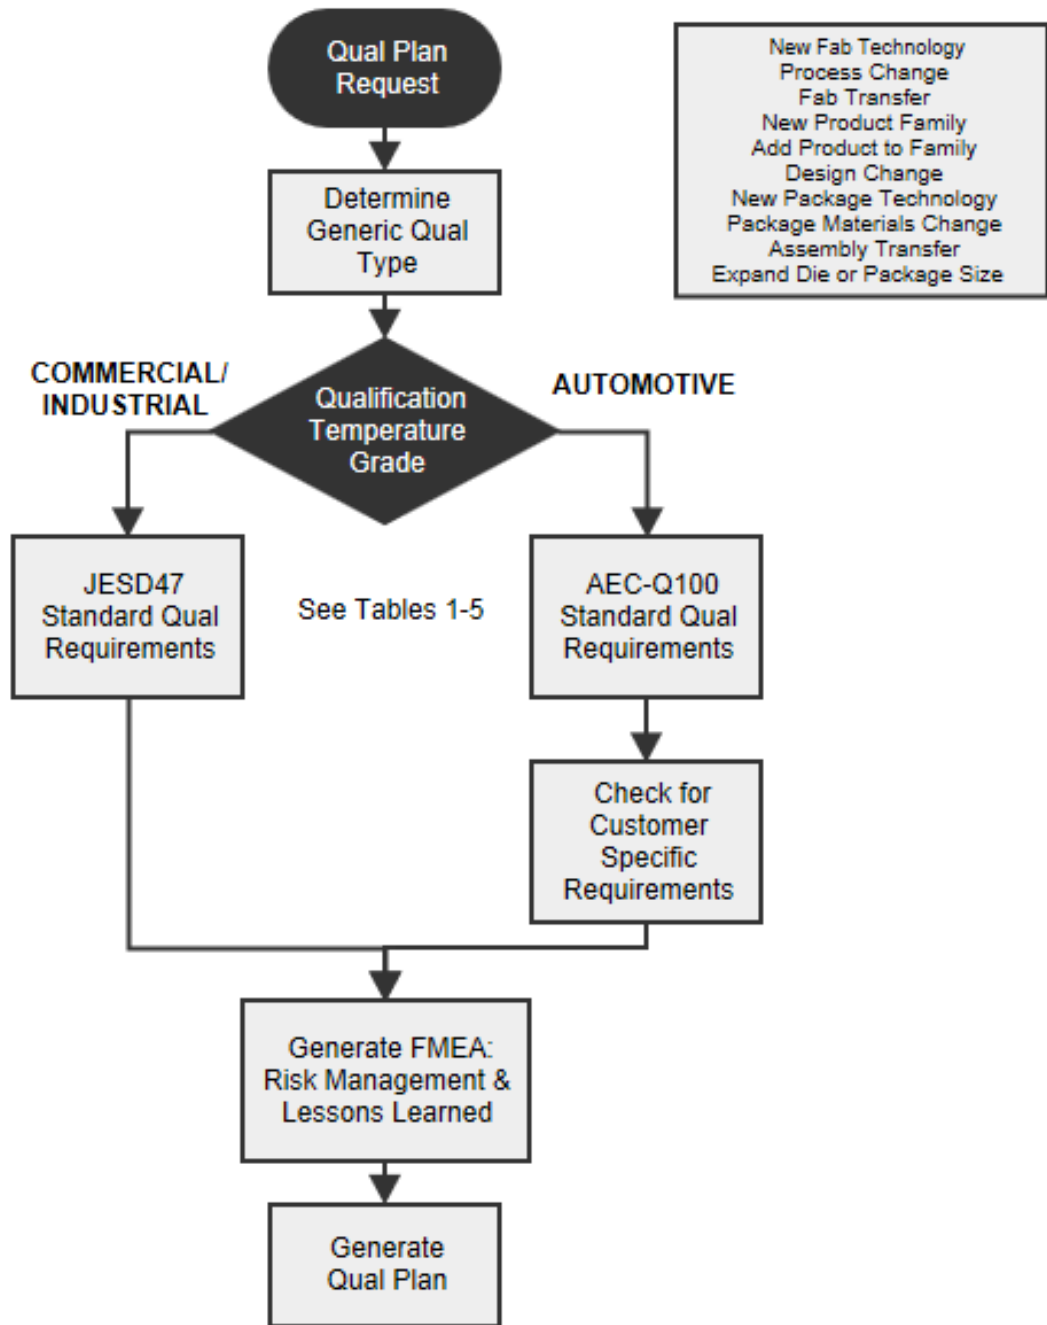

Product families are qualified based upon the requirements outlined in Table 2.2. In general, Lattice Semiconductor follows the current Joint Electron Device Engineering Council (JEDEC) and Military Standard testing methods. Lattice automotive products are qualified and characterized to the Automotive Electronics Council (AEC) testing requirements and methods. Product family qualification will include products with a wide range of circuit densities, package types, and package lead counts. Major changes to products, processes, or vendors require additional qualification before implementation.

The ispPAC-POWR product family is built on the 0.35um EE8A Electrically Erasable (E2 cell based) CMOS process at either United Microelectronics Company (UMC) wafer fab, or Epson wafer fab at Sakata, and assembled at Advance Semiconductor Engineering Malaysia, (ASEM), Amkor Technology, Korea and UNISEM Group, Indonesia, in TQFP and QFNS packages. To verify product reliability, Lattice Semiconductor maintains an active Early Life and Inherent Life Reliability Monitor program on the ispPAC-POWR products.

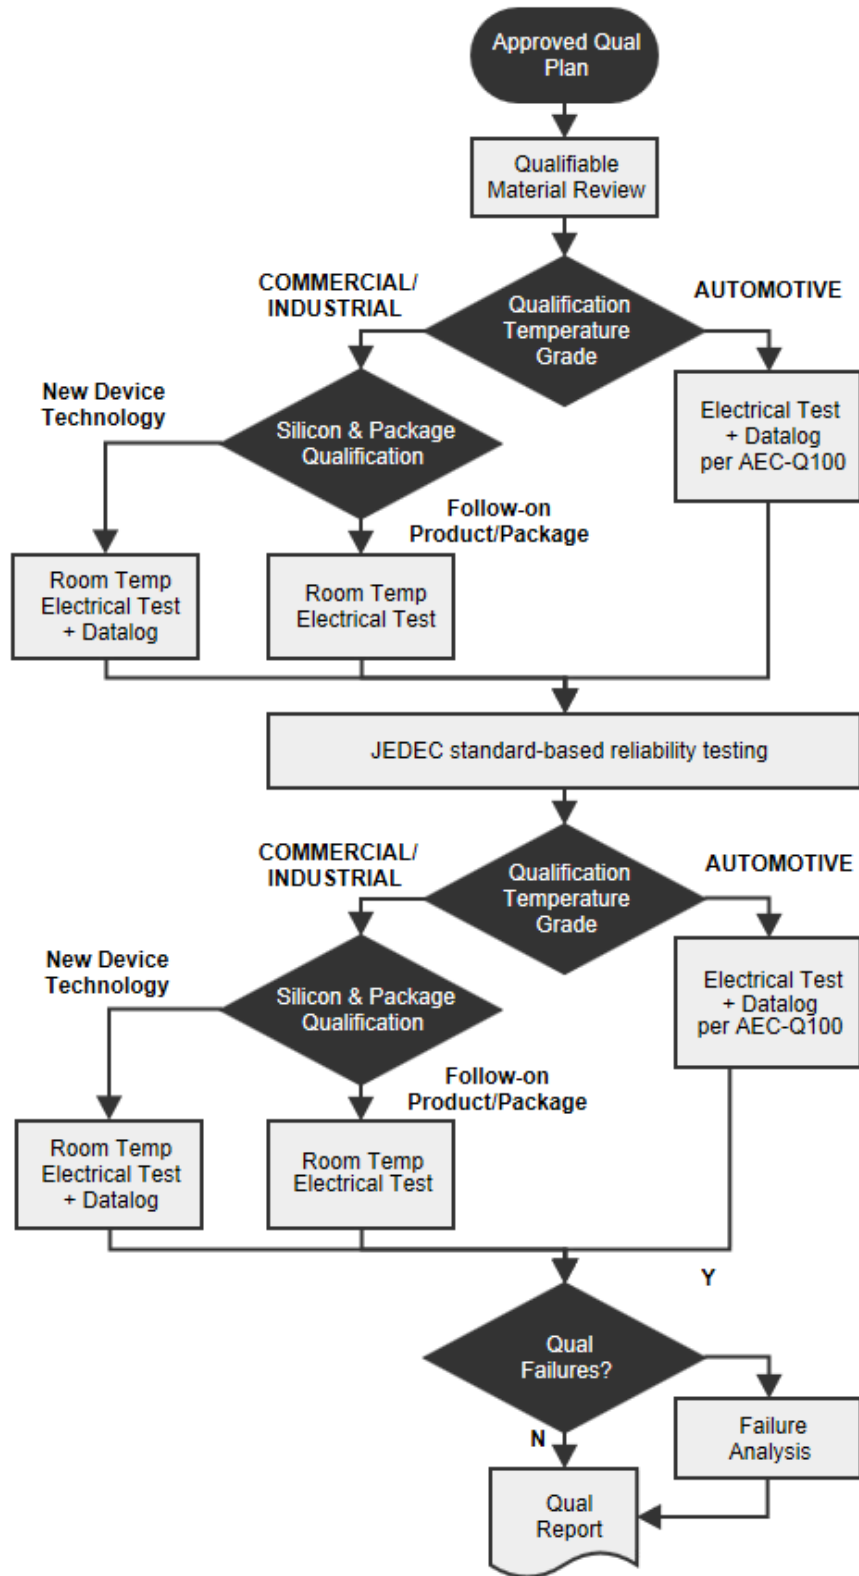

Lattice Semiconductor maintains a regular reliability monitor program. The current Lattice Reliability Monitor Report can be found [here](#).

3.0 QUALIFICATION DATA FOR ispPAC-POWR PRODUCT FAMILY

The ispPAC-POWR product family is built on the 0.35um EE8A Electrically Erasable (E2 cell based) CMOS process at United Microelectronics Company (UMC) and assembled at ASEM, Amkor and UNISEM, in TQFP and QFNS packages. To verify product reliability, Lattice Semiconductor maintains an active Early Life and Inherent Life Reliability Monitor program on the ispPAC-POWR products.

3.1 ispPAC-POWR Product Family Life Data

High Temperature Operating Life (HTOL) Test

The High Temperature Operating Life test is used to thermally accelerate those wear out and failure mechanisms that would occur as a result of operating the device continuously in a system application. Consistent with JEDEC JESD22-A108 "Temperature, Bias, and Operating Life", a pattern specifically designed to exercise the maximum amount of circuitry is programmed into the device and this pattern is continuously exercised at specified voltages as described in test conditions for each device type.

EE8A Life Test (HTOL) Conditions:

Stress Duration: 168, 500, 1000 hours

Temperature: 125°C

Stress Voltage ispPAC-POWR: $V_{CC} = 3.6V$

Preconditioned: 100 program/erase cycles

Method: JESD22-A108C

3.2 ispPAC-POWR Product Family High Temperature Data Retention (HTRX)

High Temperature Data Retention (HTRX)

The High Temperature Data Retention test measures the Electrically Erasable cell (E2 cell) reliability while the High Temperature Operating Life test is structured to measure functional operating circuitry failure mechanisms. The High Temperature Data Retention test is specifically designed to accelerate charge gain on to or charge loss off of the floating gates in the device's array. Since the charge on these gates determines the actual pattern and function of the device, this test is a measure of the reliability of the device in retaining programmed information. In High Temperature Data Retention, the E2 cell reliability is determined by monitoring the cell margin after biased static operation at 150°C. All cells in all arrays are life tested in both programmed and erased states.

Data Retention (HTRX) Conditions:

Stress Duration: 168, 500, 1000 hours

Temperature: 150°C

Stress Voltage ispPAC-POWR: $V_{CC} = 3.6V$

Preconditioned with 100 program/erase cycles

Method: JESD22-A103C/JESD22-A117A

Table 3.2.1 ispPAC-POWR High Temperature Data Retention (HTRX) Results

Product Name	Foundry	Lot #	Qty	168 Hrs Result	500 Hrs Result	1000 Hrs Result	Cumulative Hours

3.3 ispPAC-POWR Product Family Extended Endurance (EE)

Extended Endurance (EE)

Extended Endurance testing measures the durability of the device through programming and erase cycles. Extended Endurance testing consists of repeatedly programming and erasing all E2 cells in the array at 25°C to simulate programming cycles the user would perform. This test evaluates the integrity of the thin tunnel oxide through which current passes to program the floating gate in each cell of the array.

Extended Endurance (EE) Conditions:

Stress Duration: 1000 cycles

Temperature: 25°C

Stress Voltage ispPAC-POWR: $V_{CC} = 3.6V$

Method: Lattice JESD22-A117B

Table 3.3.1 ispPAC-POWR Extended Endurance (EE) Results

Product Name	Foundry	Lot #	Quantity	0 Cycles Result	1000 Cycles Result
ispPAC-POWR1220AT8	Epson	Lot #1	10	0	0

3.4 ispPAC-POWR Product Family - ESD and Latch UP Data

Electrostatic Discharge-Human Body Model:

ispPAC-POWR product family was tested per the JESD22-A114E Electrostatic Discharge (ESD) Sensitivity Testing Human Body Model (HBM) procedure.

All units were tested at 25°C prior to reliability stress and after reliability stress. No failures were observed within the passing classification.

Table 3.4.1 ispPAC-POWR ESD-HBM Data

INDEX return

Latch-Up:

ispPAC-POWR product family was tested per the JEDEC EIA/JESD78A IC Latch-up Test procedure.

All units were tested at 25°C and +105°C prior to reliability stress and after reliability stress. No failures were observed within the passing classification.

Earlier latch-up testing at Lattice was hardware limited to room temperature testing. Additionally, maximum-rated ambient temperature latch-up testing is generally considered to be approximately 2X worse than the trigger values found at room temperature. In order to guard band our room temperature IO latch-up testing the standard was 4X, or +/- 400mA trigger current. Therefore, the previous Lattice I/O LU standard was >400mA at room temperature, while the present standard is >100mA at maximum-rated ambient temperature.

Table 3.4.3 ispPAC-POWR I/O Latch Up Data

4.0 PACKAGE QUALIFICATION DATA FOR ispPAC-POWR PRODUCT FAMILY

The ispPAC-POWR product family is offered in TQFP and QFNS packages. To cover the range of die in the largest package types for this product family, different package and die combinations were chosen as the generic qualification vehicles for all the package qualification tests including, Temperature Cycling (T/C), Unbiased HAST (UHAST) and Biased HAST (BHAST). Mechanical evaluation tests include Scanning Acoustic Tomography (SAT) and visual package inspection.

The generation and use of generic data is applied across a family of products or packages emanating from one base wafer foundry or assembly process is a Family Qualification, or Qualification By Extension. For the package stresses BHAST and UHAST, these are considered generic for a given Package Technology. T/C is considered generic up to an evaluated die size + package size + 10%, for a given Package Technology. Surface Mount Pre-Conditioning (SMPC) is considered generic up to an evaluated Peak Reflow temperature, for a given Package Technology. The following table demonstrates the package qualification matrix.

Table 4.1 ispPAC-POWR Product-Package Qualification-By-Extension Matrix

Product-Package Qualification Matrix		Unisem		ASEM / Amkor / Unisem		ASEM		
Product	Stress Test	24-QFNS	32-QFNS	48-TQFP	100-TQFP	24-QFNS	32-QFNS

4.1 ispPAC-POWR Product Family Surface Mount Preconditioning Testing

The Surface Mount Preconditioning (SMPC) Test is used to model the surface mount assembly conditions during component solder processing. All devices stressed through Temperature Cycling, Un-biased HAST and Biased HAST were preconditioned. This preconditioning is consistent with JEDEC JESD22-A113 "Preconditioning Procedures of Plastic Surface Mount Devices Prior to Reliability Testing", Moisture Sensitivity Level 3 (MSL3) package moisture sensitivity and dry-pack storage requirements.

Consistent with Lattice Semiconductor Corp. document # 100164, package reliability testing can be qualified by extension. Once a package outline is qualified within a package grouping as per doc #103639, all lower lead count (and smaller body size) packages within that package type and assembly technology are qualified by extension. Additionally, once an assembly technology has been qualified for one package type, that package type shall be qualified by extension to all future fabrication processes as long as those processes continue to use the same critical elements. Those critical elements in this case, are that the process-to-process interlayer dielectric material and thickness differences do not exceed the current production process limits for the qualification vehicle used. For 180nm and older technologies, the critical elements are considered equivalent.

Surface Mount Preconditioning (MSL3)

(5 Temperature Cycles between -55°C and 125°C, 24 hours bake @ 125°C, 30°C/60% RH, soak 192 hours, Reflow Simulation, 3 passes) performed before all EE9 package tests.

MSL3 Packages: TQFP

Surface Mount Preconditioning (MSL1)

(5 Temperature Cycles between -55°C and 125°C, 24 hr. bake @ 125°C, 85°C/85%RH soak, 168 hrs, 260C Reflow Simulation, 3 passes)

MSL1 Packages: QFNS

Method: J-STD-020D.1 and JESD22-A113

4.2 ispPAC-POWR Product Family Temperature Cycling Data

The Temperature Cycling test is used to accelerate those failures resulting from mechanical stresses induced by differential thermal expansion of adjacent films, layers and metallurgical interfaces in the die and package. Devices are tested at 25°C after exposure to repeated cycling between -55°C and +125°C in an air environment consistent with JEDEC JESD22-A104C “Temperature Cycling”, Condition B temperature cycling requirements. Prior to Temperature Cycling testing, all devices are subjected to Surface Mount Preconditioning.

MSL3 Packages: TQFP

MSL1 Packages: QFNS

Stress Duration: 1000 cycles

Stress Conditions: Temperature cycling between -55°C to 125°C

Method: JESD22-A104C

4.3 Unbiased HAST Data

Unbiased Highly Accelerated Stress Test (HAST) testing uses both pressure and temperature to accelerate penetration of moisture into the package and to the die surface. The Unbiased HAST test is designed to detect ionic contaminants present within the package or on the die surface, which can cause chemical corrosion. Consistent JEDEC JESD22-A118, "Accelerated Moisture Resistance - Unbiased HAST," the Unbiased HAST conditions are 96 hour exposure at 130°C, 85% relative humidity, and 2 atmospheres of pressure. Prior to Unbiased HAST testing, all devices are subjected to Surface Mount Preconditioning.

MSL3 Packages: TQFP

MSL1 Packages: QFNS

Stress Duration: 96 Hrs

Stress Conditions: 130°C, 15psig, 85% RH

Method: JESD22-A118

4.4 THB: Biased HAST Data

Highly Accelerated Stress Test (HAST) testing uses both pressure and temperature to accelerate penetration of moisture into the package and to the die surface. The Biased HAST test is used to accelerate threshold shifts in the MOS device associated with moisture diffusion into the gate oxide region as well as electrochemical corrosion mechanisms within the device package. Consistent with JEDEC JESD22-A110B “Highly-Accelerated Temperature and Humidity Stress Test (HAST)”, the biased HAST conditions are with Vcc bias and alternate pin biasing in an ambient of 130°C, 85% relative humidity, and 2 atmospheres of pressure. Prior to Biased HAST testing, all devices are subjected to Surface Mount Preconditioning.

4.5 HTSL: High Temperature Storage Life Data

High Temperature storage test is typically used to determine the effect of time and temperature, under storage conditions, for thermally activated failure mechanisms of solid state electronic devices. Units were stressed per JESD22-A103C, High Temperature Storage Life. Prior to Unbiased HAST testing, all Pb-free devices are subjected to Surface Mount Preconditioning.

The High Temperature Storage Life units were stressed at 150°C.

High Temperature Storage Life (HTSL) Conditions:

Stress Duration: 168, 500, 1000, hours.

Temperature: 150°C

Method: JESD22-A103C

Table 4.5.1 High Temperature Storage Life Results

5.0 ispPAC-POWR PROCESS RELIABILITY WAFER LEVEL REVIEW

The ispPAC-POWR product family is built on EE8A which is a 3.3V shallow trench isolated, 0.35um drawn/0.25um Leff CMOS process with Electrically Erasable (E2) cells. This process uses three planarized metal interconnect layers and single layer polysilicon fabricated at either United Microelectronics Company (UMC), or Epson Sakata.

Several key fabrication process related parameters have been identified by the foundry that would affect the Reliability of the End-Product. These parameters are tested during the Development Phase of the Technology. Passing data (a 10yr lifetime at the reliability junction temperature) must be obtained for three lots minimum for each parameter before release to production. Normal operating conditions are defined in the Electrical Design Rules (EDR). These parameters are:

Hot Carrier Immunity (HCI): Effect is a reduction in transistor I_{dsat} . Worst case is low temperature.

Time Dependent Dielectric Breakdown (TDDB): Transistor and capacitor oxide shorts or leakage.

Negative Bias Temperature Instability (NBTI): Symptom is a shift in V_{th} (also a reduction in I_{dsat}).

Electromigration Lifetime (EML): Symptom is opens within, or shorts between, metal conductors.

Stress Migration (SM): Symptom is a void (open) in a metal Via due to microvoid coalescence. SM is not an issue for the EE8A BEOL (etched Al lines, W plug Vias, SiO IMD).

Table 5.1 UMC Foundry Wafer Level Reliability Results for EE8A (0.35um) Process Technology

Note: Reliability life times are based on listed temperature and use conditions. Detailed WLR test conditions are available upon request.

INDEX return

Hot Carrier Immunity (HCI): Effect is a reduction in transistor I_{dsat} . Worst case is low temperature.
Time Dependent Dielectric Breakdown (TDDB): Transistor and capacitor oxide shorts or leakage.
Negative Bias Temperature Instability (NBTI): Symptom is a shift in V_{th} (also a reduction in I_{dsat}).
Electromigration Lifetime (EML): Symptom is opens within, or shorts between, metal conductors.
Stress Migration (SM): Symptom is a void (open) in a metal Via due to microvoid coalescence. SM is not an issue for the EE8A BEOL (etched Al lines, W plug Vias, SiO IMD).

Table 5.2 Epson Foundry Wafer Level Reliability Results for EE8A (0.35um) Process Technology

HCI	Device	LVN	LVP
	deltalds	-10%	-10%
	Celsius	25	25
	Vgstress	Vd/2	0
	Vds	3.6	-3.6
	DC-HCI	3 lots \geq	2 lots \geq
	TTF >1yr	5.5yr	8.2e3yr

TDDB	Device	LVN	MIM
	Celsius	130	130
	Vg	3.3	15
	Area	8000um ²	2.25e4um ²
	0.1% TTF	3 lots \geq 2.8e3yr	3 lots \geq 2.1e3yr

EML	Layer	M1	M2	M3
	Celsius	130	130	130
	Delta R	+20%	+20%	+20%
	Jmax	1.0mA/um	1.4mA/um	1.4mA/um
	0.1% TTF	3 lots \geq 22.4yr	3 lots \geq 30.5yr	3 lots \geq 16.2yr

6.0 ispPAC-POWR PACKAGE ASSEMBLY INTEGRITY TESTS

6.1 Wire Bond Shear Test

This procedure is used to measure the wire bond strength at the ball joints. Thirty bonds from a minimum of five devices were used for Wire Bond Shear.

WIRE BOND SHEAR TEST RESULTS: All bond shear observations were > 20 grams for TQFP packages tested.

The average measured bond shear results for TQFP were Cpk of > 4.76 and Ppk of > 4.8.

6.2 Wire Bond Pull

This procedure is used to measure the wire bond strength at the ball joints and stitch bonds. For products evaluation thirty bonds from a minimum of five devices were used for and Wire Bond Pull. Test conditions for these tests were 6 grams minimum for 1.0 mil gold wire

WIRE BOND PULL RESULTS: All bond pull observations were >4 grams for TQFP packages tested.

The average measured wire bond pull results for TQFP were Cpk of > 1.39.

6.3 Solderability

This procedure is used to evaluate the solderability of device terminals normally joined by a soldering operation. An accelerated aging test is included in this test method, which simulates natural aging under a combination of various storage conditions that have deleterious effects. Units are exposed to a 8 hour steam preconditioning followed a flux exposure for 7 seconds and a dip in Pb-free solder alloy @ 260 °C ± 5°C for 5 seconds. Minimum of 22 leads from 3 devices per lot were tested with zero failure acceptance.

No failures were observed for TQFP packages. All the tested units passed. There was less than 5% pitting and dewetting on the solder covered area.

No failures were observed for QFNS packages. All the tested units passed. There was less than 5% pitting and dewetting on the solder covered area.

6.4 Physical Dimensions

Devices were measured using the appropriate Lattice Semiconductor case outline drawings.

The 10 devices of TQFP from 3 different lots were measured with no failures found. The calculated Cpk on this small sample is Cpk > 2.0.

8.0 REVISION HISTORY

Table 8.1 Lattice ispPAC-POWR Product Family Qualification Summary revisions

Date	Revision	Section	Change Summary
August 2009	A	---	Initial document release.
January 2010	B	4.1 SMPC	Added Amkor QFNS MSL1 SMPC data.
November 2011	C	Qualification data sections 3, 4 & 5	Added Qualification data in support of PCN# 01A-12 in sections 3, 4 and 5: <ul style="list-style-type: none"> In Section 3, see all data records for Product Name = ispPAC-POWR1220AT8 and Foundry = Epson In Section 4, see all data records for Product Name = ispPAC-POWR1220AT8 and Assembly Site = ASEM In Section 5, see all Wafer Level Reliability data in Table 5.2 = Epson Foundry
December 2011	D	Revision History	Added revision history as a standard section.
January 2012	E	Table 3.1	Updated ispPAC-POWR1220AT8 HTOL device hours
August 2012	F	Qualification data sections 3 & 4	Continuance Qualification data in support of PCN# 01A-12 in sections 3, 4
October 2012	G		Administrative change to internal document.
March 2013	H	Table 2.2	Update program/erase cycles typo and Customer letter.
March 2020	I	Qualification data (section 4) and Package Attributes (section 7)	Qualification of alternate assembly site (ASEM)
January 2021	J	Qualification data (section 4) and Standard Qualification Testing (table 2.2)	Update of ASEM qualification data and removal of mentioned stress-related Lattice Work Instructions.
