Acronyms in This Document

A list of acronyms used in this document.

Acronym	Definition
WDT	Watchdog Timer
NMI	Non-Maskable Interrupt
FPGA	Field Programmable Gate Array
RTL	Register Transfer Level

1. Introduction

The Watchdog Timer IP Core is designed for use as an indicator that a corrective action is needed in response to a computer or a processor malfunction. The design features a two-stage timer which supports non-maskable interrupt and a hard reset.

This design is implemented in Verilog. It can be targeted to CrossLink™-NX and Certus™-NX FPGA devices and implemented using the Lattice Radiant® Software Place and Route tool integrated with the Synplify Pro® synthesis tool.

1.1. Quick Facts

Table 1.1 presents a summary of the Watchdog Timer IP Core.

Table 1.1. Quick Facts

IP Requirements	Supported FPGA Families	CrossLink-NX, Certus-NX
Resource Utilization	Targeted Devices	LIFCL-40, LIFCL-17, LFD2NX-40
	Resources	See Table A.1
Design Tool Support	Lattice Implementation	IP Core v1.0.x – Lattice Radiant Software 2.1
	Synthesis	Lattice Synthesis Engine
		Synopsys® Synplify Pro for Lattice
Simulation	For a list of supported simulators, see the Lattice Radiant Software 2.1 User Guide .	

1.2. Features

Key features of the Watchdog Timer IP Core include:

- Seamlessly work with sleep mode
- Programmable timer spec 50-500 ms (10 ms)
- Two-stage timer that supports warm boot and cold boot resets
- You can specify in cycles or time
- Supports trigger input, reset and NMI output

1.3. Conventions

1.3.1. Nomenclature

The nomenclature used in this document is based on Verilog HDL.

1.3.2. Signal Names

Signal Names that end with:

- *_n* are active low
- *_i* are input signals
- *_o* are output signals

1.3.3. Attribute

The names of attributes in this document are formatted in title case and italicized (*Attribute Name*).

2. Functional Descriptions

2.1. Overview

The Watchdog Timer IP Core performs the following functions:

- Send a non-maskable interrupt to the computer (nmi_o)
- Send a reset to the computer for system restart (reset_o)

WDT IP Core is a two-stage timer that will start to count depending on the computer status. The computer continuously sends a kick signal to the watchdog timer as its status, absence of the kick signal means there is a hardware malfunction or program error in the computer.

The Watchdog Timer IP Core uses an up-counter that counts from zero to a timeout value at a rate that is determined by the configurable mode and the clock frequency.

2.1.1. Watchdog Timer Modes

Cycle

When in cycle mode, the user can configure the timeout in terms of the number of cycles for each stage of timer. The number of cycle refers to the count needed by the watchdog timer to reach in order to assert the timeout signal.

Time

Using the time mode, the user can configure the timeout in milliseconds and the clock frequency ranging from 10kHz to 150 MHz.

Reset ports

The Watchdog Timer IP Core supports both warm boot (nmi_o) and cold boot (reset_o) resets. Reset ports will be asserted once the timeout value is reached. The warm boot reset is a non-maskable interrupt which serves as a warning to the computer that a system reset is expected. When this port is asserted, the computer should either debug the program error or store the important files in running programs. The cold boot or the hard reset, as the name implies, will reset the whole system once the second timeout value has reached.

Figure 2.1 shows a functional diagram for the Watchdog Timer IP Core.

Figure 2.1. Functional Block Diagram

2.2. Signal Description

Table 2.1. Watchdog Timer IP Core Signal Description

Port Name	I/O	Width	Description
Clock and Reset			
clk_i	In	1	System clock.
resetn_i	In	1	Active low reset.
reset_o	Out	1	Cold boot output reset
Interrupt Port			
nmi_o	Out	1	Non-maskable interrupt signal.
WDT Ports			
kick_i	In	1	Kick signal connected from an external computer/processor.
timer1_count_o	Out	25	Up counter for Timer Stage 1
timer2_count_o	Out	25	Up counter for Timer Stage 2
timer_expired_o	Out	1	Timer Expiration bit. 1'b0 – watchdog timer is still counting 1'b1 – watchdog timer count expires

2.3. Attribute Summary

The configurable attributes of the Watchdog Timer IP Core are shown in [Table 2.2](#) and are described in [Table 2.3](#). The attributes can be configured through the IP Catalog's Module/IP wizard of the Lattice Radiant Software.

Table 2.2. Attributes Table

Attribute	Selectable Values	Default	Dependency on Other Attributes
General			
Mode	("Cycle", "Time")	"Cycle"	—
Frequency Unit	("kHz", "MHz")	"MHz"	Active if <i>Watchdog Timer Mode</i> == Time
System Clock Frequency	(10, 999), (1,150)	100	Active if <i>Watchdog Timer Mode</i> == Time, else will use the testbench clock frequency provided by the user. Selectable values are dependent on <i>Frequency Unit</i>
Timer Stage 1			
Timeout (number of cycles)	(500, 75000000)	5000000	Active if <i>Watchdog Timer Mode</i> == Cycle
Timeout (ms)	(50, 500)	50	Active if <i>Watchdog Timer Mode</i> == Time
Timer Stage 2			
Timeout (number of cycles)	(500, 75000000)	5000000	Active if <i>Watchdog Timer Mode</i> == Cycle
Timeout (ms)	(50, 500)	50	Active if <i>Watchdog Timer Mode</i> == Time

Table 2.3. Attributes Descriptions

Attribute	Description
General	
Mode	Specifies the Watchdog Timer Mode.
Frequency Unit	Specifies the unit for <i>System Clock Frequency</i> .
System Clock Frequency	Specifies the user clock frequency.
Timer Stage 1	
Timeout (number of cycles)	Specifies the timeout of Timer Stage 1 in terms of number of cycles.
Timeout (ms)	Specifies the timeout of Timer Stage 1 in terms of ms.
Timer Stage 2	
Timeout (number of cycles)	Specifies the timeout of Timer Stage 2 in terms of number of cycles.
Timeout (ms)	Specifies the timeout of Timer Stage 2 in terms of ms.

2.4. Timing Diagrams

During normal operation, the connected computer/processor regularly sends a “kick” signal to the watchdog timer using `kick_i` port. When the kick of computer suddenly stopped, timer stage 1 will begin to count. Timer Stage 1 will eventually equal to the timeout value which will assert the `nmi_o` port. This port will trigger the counting of Timer Stage 2 and simultaneously notify the computer by means of the warm boot (`nmi_o`) that a reset is imminent. After the Timer Stage 2 times out, cold boot (`reset_o`) will assert which will forcefully restart the computer. See [Figure 2.2](#) for a sample Watchdog Timer timing diagram.

Figure 2.2. Timing Diagram

3. IP Generation and Evaluation

This section provides information on how to generate the Watchdog Timer IP Core using the Lattice Radiant Software and how to run simulation and synthesis. For more details on the Lattice Radiant Software, refer to the [Lattice Radiant Software 2.1 User Guide](#).

3.1. Licensing the IP

An IP core-specific license string is required enable full use of the Watchdog Timer IP Core in a complete, top-level design. You can fully evaluate the IP core through functional simulation and implementation (synthesis, map, place and route) without an IP license string. This IP core supports Lattice’s IP hardware evaluation capability, which makes it possible to create versions of the IP core, which operate in hardware for a limited time (approximately four hours) without requiring an IP license string. See Hardware Evaluation section for further details. However, a license string is required to enable timing simulation and to generate bitstream file that does not include the hardware evaluation timeout limitation.

3.2. Generation and Synthesis

The Lattice Radiant Software allows you to customize and generate modules and IPs and integrate them into the device’s architecture. The procedure for generating the Watchdog Timer IP Core in Lattice Radiant Software is described below.

To generate the Watchdog Timer IP Core:

1. Create a new Lattice Radiant Software project or open an existing project.
2. In the **IP Catalog** tab, double-click on **Watchdog Timer** under **IP, Processors_Controllers_and_Peripherals** category. The **Module/IP Block Wizard** opens as shown in [Figure 3.1](#). Enter values in the **Instance name** and the **Create in** fields and click **Next**.

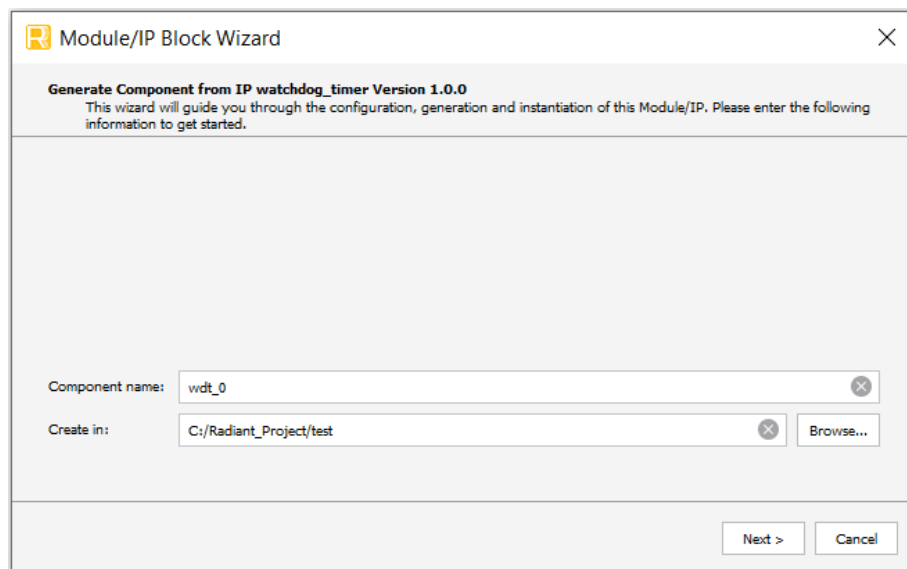

Figure 3.1. Module/IP Block Wizard

3. In the module’s dialog box of the **Module/IP Block Wizard** window, customize the selected Watchdog Timer IP Core using drop-down menus and check boxes. As a sample configuration, see [Figure 3.2](#) For configuration options, see the [Attribute Summary](#) section.

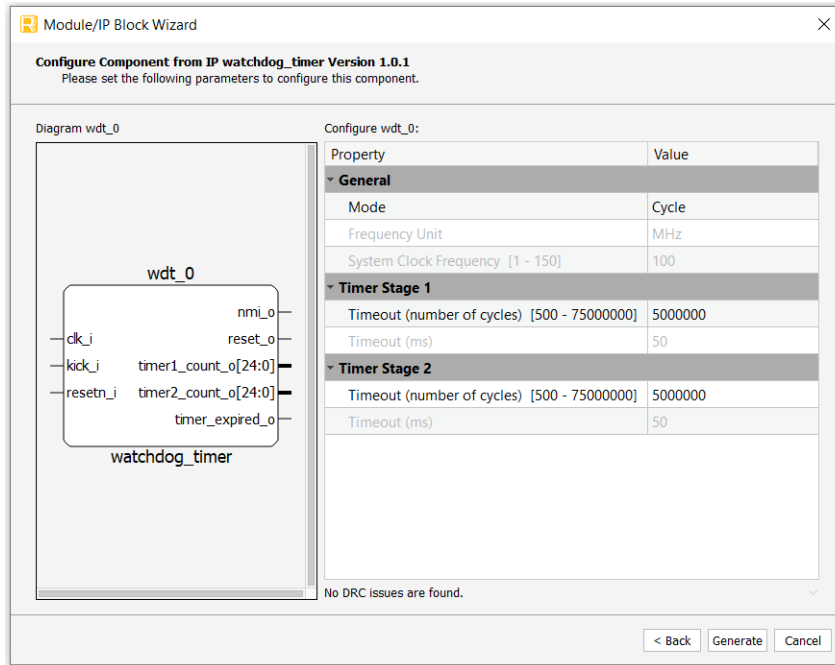

Figure 3.2. Configure User Interface of Watchdog Timer IP Core

- Click **Generate**. The **Check Generating Result** dialog box opens, showing design block messages and results as shown in Figure 3.3.

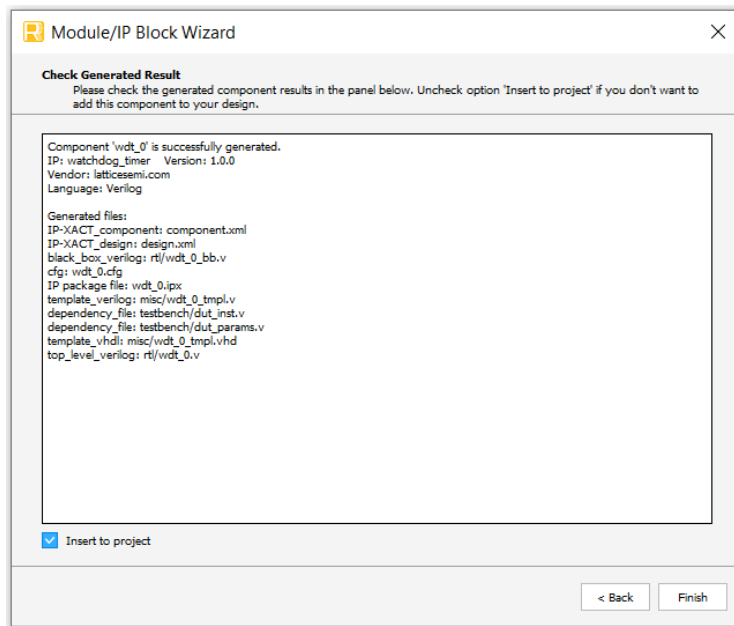

Figure 3.3. Check Generating Result

- Click the **Finish** button. All the generated files are placed under the directory paths in the **Create in** and the **Instance name** fields shown in Figure 3.1.

The generated Watchdog Timer IP Core package includes the black box (<Instance Name>_bb.v) and instance templates (<Instance Name>_tmpl.v/vhd) that can be used to instantiate the core in a top-level design. An example RTL top-level reference source file (<Instance Name>.v) that can be used as an instantiation template for the IP core is also provided. You may also use this top-level reference as the starting template for the top-level for their complete design. The generated files are listed in [Table 3.1](#).

Table 3.1. Generated File List

Attribute	Description
<Instance Name>.ipx	This file contains the information on the files associated to the generated IP.
<Instance Name>.cfg	This file contains the parameter values used in IP configuration.
component.xml	Contains the ipxact:component information of the IP.
design.xml	Documents the configuration parameters of the IP in IP-XACT 2014 format.
rtl/<Instance Name>.v	This file provides an example RTL top file that instantiates the IP core.
rtl/<Instance Name>_bb.v	This file provides the synthesis black box.
misc/<Instance Name>_tmpl.v misc /<Instance Name>_tmpl.vhd	These files provide instance templates for the IP core.

3.3. Running Functional Simulation

Running functional simulation can be performed after the IP is generated. The following steps can be performed.

1. Click the  button located on the **Toolbar** to initiate the **Simulation Wizard** shown in [Figure 3.4](#).

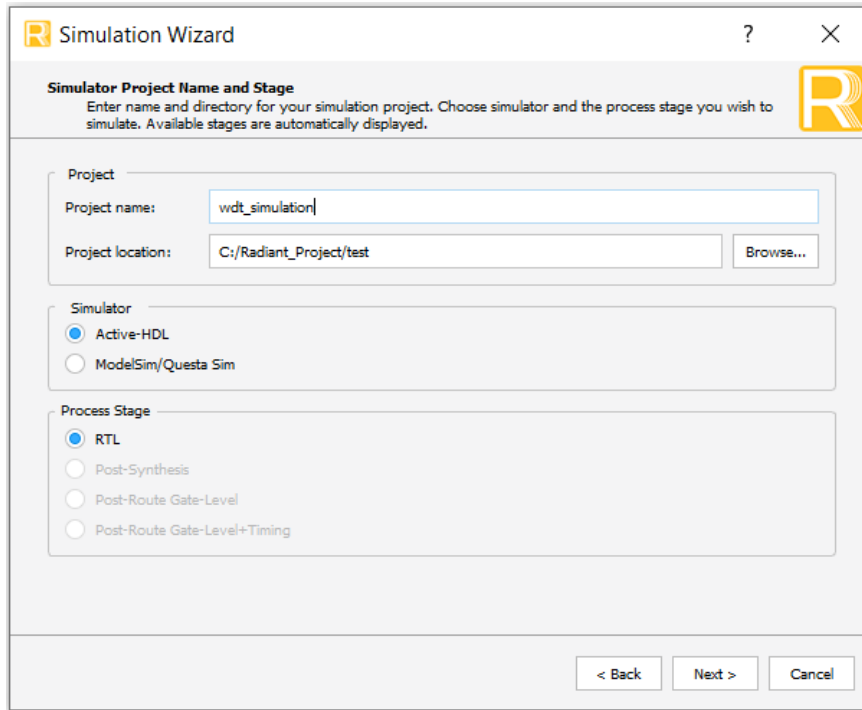

Figure 3.4. Simulation Wizard

2. Click **Next** to open the **Add and Reorder Source** window as shown in [Figure 3.5](#).

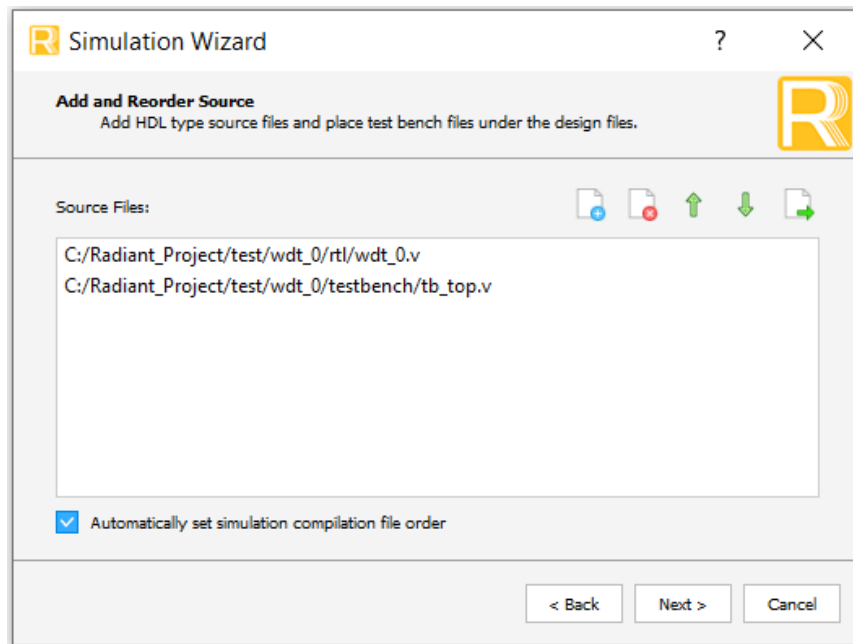

Figure 3.5. Adding and Reordering Source

3. Click **Next**. The Summary window is shown. Click **Finish** to run the simulation.

Note: It is necessary to follow the procedure above until it is fully automated in the Lattice Radiant Software Suite. The results of the simulation in our example are provided in [Figure 3.6](#).

Figure 3.6. Simulation Waveform

3.4. Hardware Evaluation

The Watchdog Timer IP Core supports Lattice’s IP hardware evaluation capability when used with LIFCL devices. This makes it possible to create versions of the IP core that operate in hardware for a limited period of time (approximately four hours) without requiring the purchase of an IP license. It may also be used to evaluate the core in hardware in user-defined designs. The hardware evaluation capability may be enabled/disabled in the Strategy dialog box. It is enabled by default. To change this setting, go to Project > Active Strategy > LSE/Synplify Pro Settings.

Appendix A. Resource Utilization

Table A.1 shows the resource utilization of the Watchdog Timer IP Core for the LIFCL-40-9BG400I device, using Synplify Pro of Lattice Radiant Software. Default configuration is used and some attributes are changed from the default value to show the effect on the resource utilization.

Table A.1. Resource Utilization

Configuration	Clk Fmax (MHz)*	Slice Registers	LUTs	EBRs
Default	175.840MHz	52	116	0
Timer Stage 1 <i>Timeout</i> = 1050, Others = Default	200MHz	52	117	0
<i>Mode Time</i> , <i>Clock Frequency</i> = 150, Others = Default	189.107	52	128	0
<i>Mode Time</i> , Timer Stage 2 <i>Timeout</i> = 100, Others = Default	160.154MHz	2	126	0

***Note:** Fmax is generated when the FPGA design only contains Watchdog Timer IP Core and the target frequency is 150MHz. These values may be reduced when user logic is added to the FPGA design.

Revision History

Revision 1.2, June 2020

Section	Change Summary
Introduction	<ul style="list-style-type: none"> Added Certus-NX support. Updated Table 1.1 to add LFD2NX-40 as targeted device. Updated Synopsis Synplify Pro version. Updated Lattice Implementation to Lattice Radiant 2.1.
Attribute Summary	Removed Calculated group. The calculated <i>Timeout (number of cycles)</i> are now reflected in Timer Stage N group. Default value of <i>Timeout (number of cycles)</i> is changed due to IP Engine limitation.
IP Generation and Evaluation	Updated Figure 3.2 .
Appendix A. Resource Utilization	<ul style="list-style-type: none"> Updated device to LIFCL-40-9BG400I. Added column for Fmax in Table A.1.
All	Updated references to Lattice Radiant Software 2.1 User Guide.

Revision 1.1, February 2020

Section	Change Summary
Introduction	Updated Table 1.1 to add LIFCL-17 as targeted device.

Revision 1.0, December 2019

Section	Change Summary
All	Initial release.
