Lattice Radiant Block-Based Design Tutorial

The Block-Based Design (Macro) tool is used to create design blocks from implemented module of a device family. This tutorial leads you through all the basic steps of creating, reusing, and exporting a macro block.

A macro block is a portion of an FPGA design that can be preserved for reuse afterwards. Some of the benefits of implementing macros in a design include the ability to reuse blocks in other designs and the ability to design more effectively as a team.

About the Tutorial

When you have completed this tutorial, you should be able to do the following:

- ▶ **Macro Creation**
 - ▶ Create a Macro for your design.
 - ▶ Use Physical Designer to set placement and routing physical constraints (optional).
 - ▶ Export Macro using three preservation levels:
 - ▶ Logical (Logic Macro)
 - ▶ Logical & Physical with Place Info (Firm Macro)
 - ▶ Logic & Physical with Placement & Routing Info (Hard Macro)
 - ▶ View macro .ipm package:
 - ▶ <macro_name>.mac
 - ▶ <macro_name>_bb.v
 - ▶ <macro_name>_bb_extra.v
 - ▶ <macro_name>_sim.vo

- ▶ <macro_name>.mdb

- ▶ **Macro Reuse**

- ▶ Import macro (.ipm) package as a design source into existing or new project for reuse.
- ▶ Loaded macro content into the design:
 - ▶ Logic Macro will be included in the post-synthesis netlist.
 - ▶ Firm/Physical Macro will be included in the post-MAP netlist.
- ▶ Run Place & Route to recognize macro physical constraint if it is in the macro package.

Time to Complete About 45 minutes.

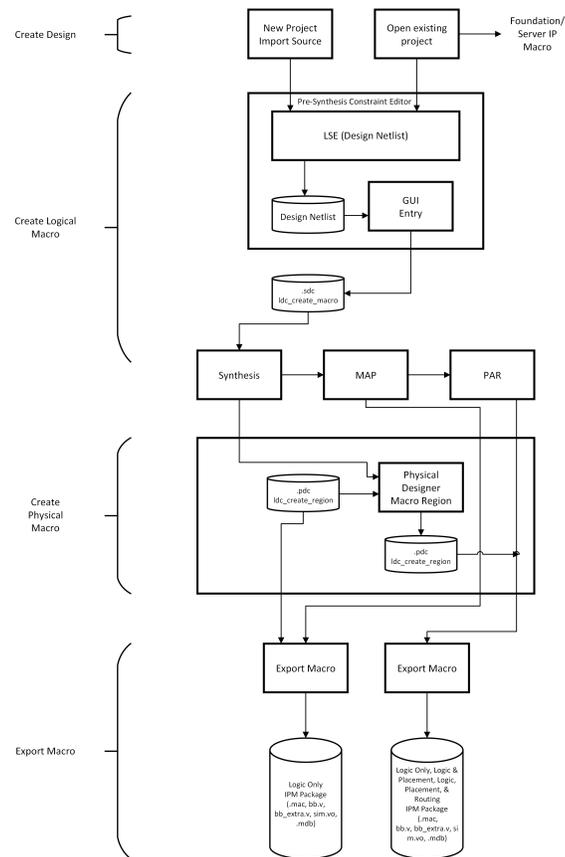

System Requirements

- ▶ The Lattice Radiant software is required to complete the tutorial.

About the Tutorial Data Flow

The following figures illustrate the tutorial data flow of macro creation and reuse.

Macro Creation

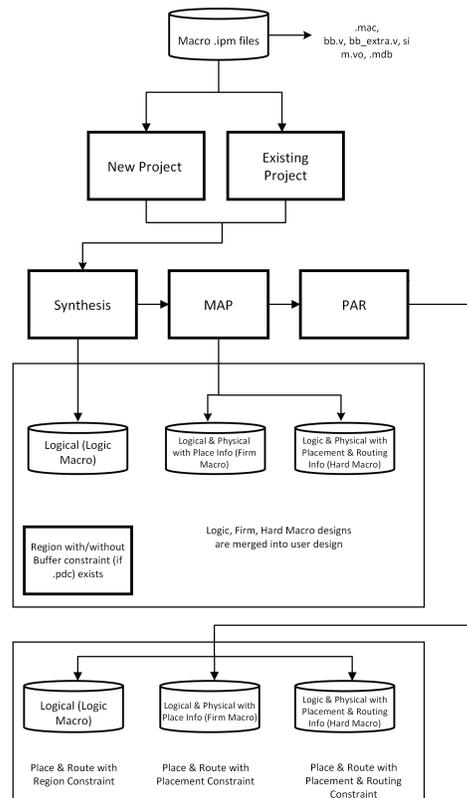

This diagram shows the steps for the macro creation process. First, a design is made using a new or existing project. Then, a logical macro is created in the Pre-Synthesis Constraint Editor, where the macro is defined. Once changes are made in the Pre-Synthesis Constraint Editor, the defined macro is saved in a.sdc file containing the ldc_create_macro constraint.

The next step is creating a macro region in Physical Designer (optional). When you save your changes in Physical Designer, a .pdc file will be generated containing the ldc_create_region constraint.

The next stage is exporting the macro using Logic, Firm, and Hard preservation levels after macro has been defined. The macro package generated by this export contains a number of files, including .mac, bb.v, bb_extra.v, sim.vo, and .mdb files. These files provide the information you need to use the macro and incorporate it into other designs or projects.

Macro Reuse

This diagram shows the steps for the macro reuse process. First, the macro .ipm files are imported and the content is loaded into the design. The Post-synthesis Logic Macro is merged into the design, ensuring that the macro constraint is honored. A region with or without a buffer constraint can be specified if the .pdc file exists.

In Map Design, Firm Macro is merged into the design, incorporating the post-MAP macro design with a placement constraint. Hard Macro is also integrated into the design with both placement & route constraints.

In Place & Route Design stage, the Logic Macro undergoes place & route with a region constraint, while the Firm Macro goes through place & route with a placement constraint. Finally, the Hard Macro goes through place & route with both placement and routing constraints.

Task 1: Create a New Macro Project

We will start by launching the Radiant software.

Opening the Project

To create a macro instance using a new project:

1. In the Radiant software, choose **File > New Project**.
 - ▶ If you have an existing project, steps 1 through 4 are optional. You can proceed to step 5.
2. In the Add Source dialog box, click **Add Source...**
3. Browse to: <Radiant_install_path>/docs/tutorial/**block_based_tutorial/macro_create** and select the **top.v** file.

Click **Next**.

4. In the **Select Device** dialog box, select a device family and choose the options that you want for that device.

Click **Next**.

Note:

The iCE40UP device is not supported.

5. In the **Select Synthesis Tool** dialog box, choose **Synplify Pro**.

Note:

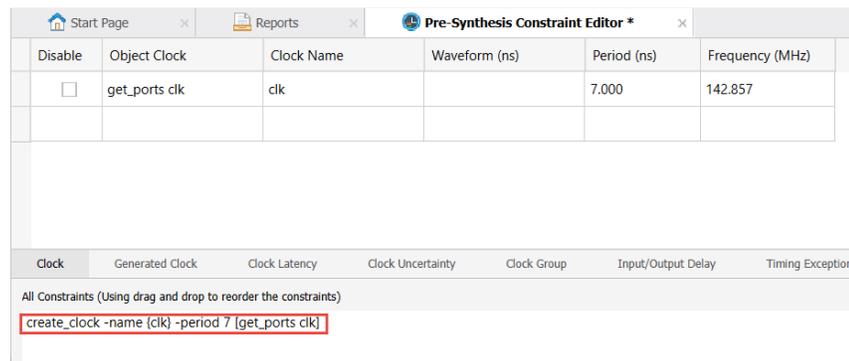

Currently, the Lattice Synthesis Engine (LSE) tool is not available for macro creation. LSE will be supported in future releases.

6. Click **Tools > Pre-Synthesis Constraint Editor**.

Synthesize Design runs when you open the Pre-Synthesis Constraint Editor tool.

7. Click the  button in the **Object Clock** column to add clock constraints (optional).

If clock constraints are added, the **create_clock** constraint will be shown in the command line.

8. In **Pre-Synthesis Constraint Editor**, click the **Macro** tab.
 - a. Click the **...** button in the **Instance** column to add shift registers.

In the example above, **shift1**, **shift2**, **shift3**, and **shift4** are **Instance Names**. The command is **get_cells** as shown in the **Object Command** pane.

- b. In the **Macro Name** column, set the names for the Macro instances (mandatory).
- c. In the **Use PIO** column, you can select the ports of the module to include the device pins inside the macro (optional).
- d. In the **Disable** column, you can click on the checkbox if you do not want to use the macro.

Disable	Instance	Macro Name	Use PIO
<input type="checkbox"/>	get_cells shift1	shiftreg1	
<input type="checkbox"/>	get_cells shift2	shiftreg2	
<input type="checkbox"/>	get_cells shift3	shiftreg3	
<input type="checkbox"/>	get_cells shift4	shiftreg4	

Clock Generated Clock Clock Latency Clock Uncertainty Clock Group Input/Output Delay Timing Exception Attribute Load Capacitance **Macro**

- e. Click **File > Save** or the **Save**  icon.

The defined macro will be saved as a synthesis constraint (.sdc) file.

You can also directly add **ldc_create_macro** constraint to the .sdc file.

Note:

The default hierarchy separator for Synplify Pro is a "." (period), while Radiant tools use "/" (back-slash). If you create a sub-module under more than two hierarchy levels, you need to manually add the **set_hierarchy_separator {/}** line or change the separator from "/" to "." in the .sdc file.

9. Run **Synthesize Design**.

Task 2: Set Macro Region

After running Synthesize Design, you can set a macro region in Physical Designer (optional).

To create a Macro Region in Physical Designer:

1. Open **Physical Designer**.
2. Right-click on the floorplan layout and select the **Create MACRO REGION...** option.

The mouse pointer changes from an arrow to a cross symbol.

3. Draw a rectangle around the sites where you want to place the macro.
Create New MACRO REGION... dialog box opens.

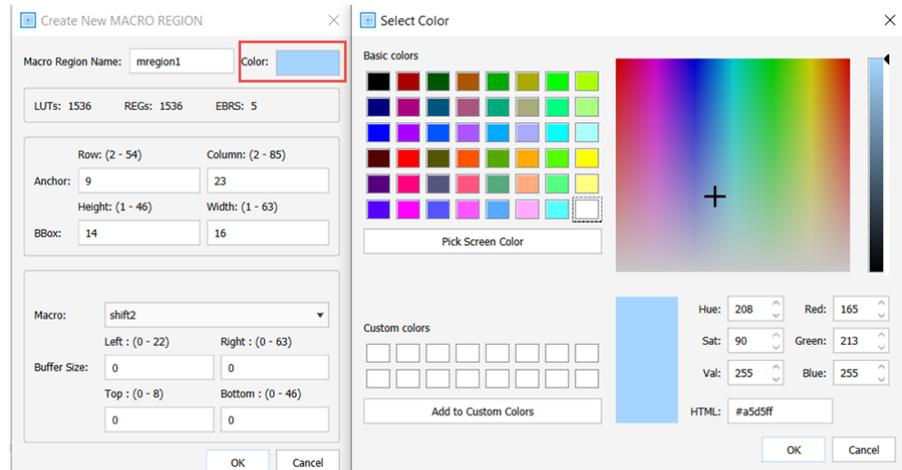

4. In the **Create New MACRO REGION** dialog box:

- a. Enter the **Macro Region Name** (mandatory).

Below the Macro Region Name field, the macro resource is displayed as a guide for the BBox size (LUTs, REGs, and EBRs).

- b. Enter your desired values for the **Anchor** and **BBox** fields.
You must enter a value within range.
- c. In the **Macro** dropdown menu, you can select the predefined macro instance from the pre-synthesis macro creation.
- d. Enter your desired value for the **Buffer Size** field (optional).
The Buffer Size range is device density dependent. You must enter a value within the range.
- e. Click the **Color** option to change the color of the macro region (optional).

5. Click **OK**.
6. Run **Map Design**.

Task 3: Run PAR to Complete Macro Creation

After creating a macro region in the current project.

- ▶ Click the **Save**  icon in **Physical Designer**.

The created macro regions are saved into a post-synthesis constraint (.pdc) file.

The .pdc file contains the following information:

- ▶ **ldc_create_region** -- defines the placement region.
- ▶ **buffer_left**/**buffer_right**/**buffer_top**/**buffer_bottom** (optional) -- defines routing region.

```

1 ldc_create_region -name mregion1 -site R4C2D -width 13 -height 13 -buffer_left 1 -buffer_right 1 -buffer_top 1 -buffer_bottom 1
2 ldc_set_location -region mregion1 [get_cells shift1]
3
4 ldc_create_region -name mregion2 -site R22C0D -width 13 -height 13 -buffer_left 1 -buffer_right 1 -buffer_top 1 -buffer_bottom 1
5 ldc_set_location -region mregion2 [get_cells shift2]
6
7 ldc_create_region -name mregion3 -site R39C4D -width 13 -height 13 -buffer_left 1 -buffer_right 1 -buffer_top 1 -buffer_bottom 1
8 ldc_set_location -region mregion3 [get_cells shift3]

```

- ▶ Run **Place & Route Design**.

If you want to import an existing .pdc file, do the following:

1. In **File List** view, right-click on **Post-Synthesis Constraints Files** folder.
2. Click **Add > Existing File**.
Browse to where your existing .pdc file is located and click **Add**.
3. Run **Place & Route Design**.

Task 4: Export Macro

1. Choose **Tools > Export Macro**

The **Export Macro** dialog box opens.

The macro data can be exported according to a specified preservation level. You can also lower the preservation level of an exported macro after importing it to a design.

▶ **Logical (Logic Macro)**

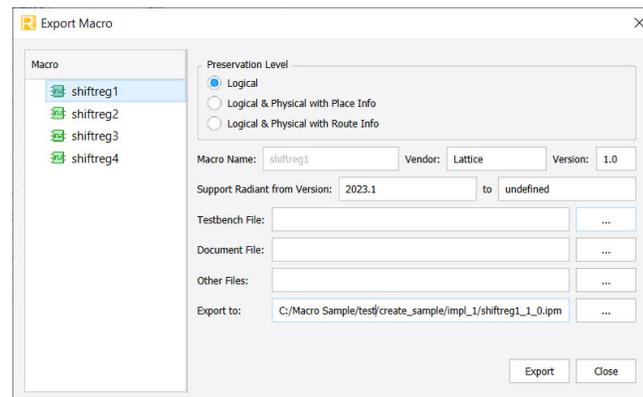

- ▶ After running **Synthesize Design** and **Map Design**, you can only export to **Logical** preservation level.

▶ **Logical & Physical with Place Info (Firm Macro)**

- ▶ After running **Place & Route Design**, you can export to **Logical**, **Logical & Physical with Place Info**, and **Logic & Physical with Placement & Routing Info** preservation levels.

▶ **Logic & Physical with Placement & Routing Info (Hard Macro)**

- ▶ After running **Place & Route Design**, you can export to **Logical**, **Logical & Physical with Place Info**, and **Logic & Physical with Placement & Routing Info** preservation levels.

You can also see the following fields in the Export Macro dialog box:

- ▶ **Macro Name** -- displays the name of the selected macro from the Macro column in the left-hand pane.
- ▶ **Vendor** -- displays the vendor name.
- ▶ **Version** -- displays the Macro IP version, the default is always 1.0.
- ▶ **Support Radiant from Version to Version** -- displays the supported maximum and minimum Radiant version. The maximum version could be empty, but the minimum is the same as the current Radiant version.
- ▶ **Testbench File** -- contains testbenches that allow you to do simulation or evaluate the macro.
- ▶ **Document File** -- contains any document such as help, user guide, or introduction file included in the macro.

- ▶ **Other Files** -- additional files to be exported with the macro.
 - ▶ **Export to** -- default path where the macro package will be saved.
2. Choose the preservation level for each instance then click **Export**.
The exported Macros are saved as .ipm package files.
The macro .ipm package contains the following:
 - ▶ **<macro_name>_mac**: contains general information of the macro project.
 - ▶ **<macro_name>_bb.v**: synthesis header file of the macro project. It is exported to define module interface for synthesis.
 - ▶ **<macro_name>_bb_extra.v**: synthesis header file exported with additional information.
 - ▶ **<macro_name>_sim.vo**: exported for macro simulation. The file is generated based on logic macro.
 - ▶ **<macro_name>.mdb**: exported Macro in unified constraints database (.udb) format. Modules representing macros will be extracted from design and exported to .mdb files. The macro will be the top module in .mdb file. The name specified in ldc_create_macro constraint will be used as the name of the top module.

Task 5: Reusing an Exported Macro

To add a Macro Block file in a new project:

1. In the Radiant software, choose **File > New Project**.
 - ▶ If you have an existing project, steps 1 through 4 are optional. You can proceed to step 5.
2. In the Add Source dialog box, click **Add Source...**
 - a. Add the following files from the <Radiant_install_path>/docs/tutorial/**block_based_tutorial/macro_reuse** directory.
 - ▶ **top.v**
 - ▶ **macro_reuse.sdc**
 - b. Click **Next**.
3. In the **Select Device** dialog box, select a device family and choose the options that you want for that device.

Note:

The iCE40UP device is not supported.

Click **Next**.

- Select **Synplify Pro** as the synthesis tool.

Note:

Currently, the Lattice Synthesis Engine (LSE) tool is not available for macro reuse. LSE will be supported in future releases.

- In the File List view, right-click **Input Files**.
- Click **Add > Existing File**.

In the **Add Existing File** dialog box, browse to: <Radiant_install_path>/docs/tutorial/**block_based_tutorial/macro_reuse/impl_1**

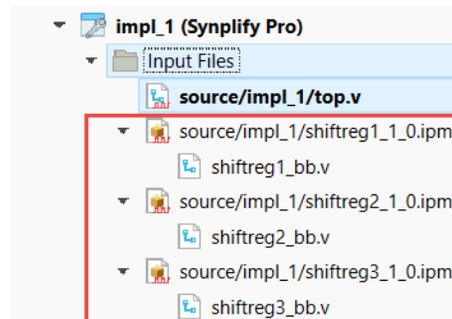

- Select the following **.ipm** files:

- ▶ shiftreg1_1_0.ipm
- ▶ shiftreg2_1_0.ipm
- ▶ shiftreg3_1_0.ipm

Click **Add**.

- Enable the **Copy file to directory** check box, then click **Add**.

You can see the imported .ipm files in the **Input Files** folder.

- Run **Synthesize Design**.

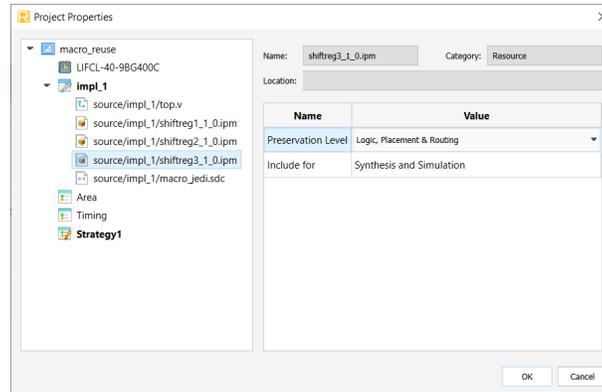

The post-synthesis Logic Macro is merged into your design.

It has <macro_name>_bb.v as the input. The logic synthesis tool treats every module that matches <macro_name>_bb.v as a black box.

- In the File List View, you can check the **Project Properties** by right-clicking the selected .ipm file to see or change their value.

You can lower the preservation level value of the imported .ipm files.

- ▶ If the imported macro's preservation level is Firm Macro, you can lower it to Logic Macro.
- ▶ If the imported macro's preservation level is Hard Macro, you can lower it to Logic and Firm Macro.

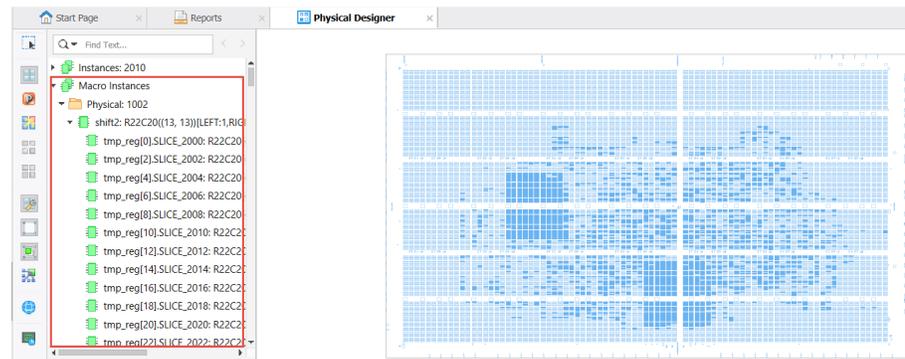

11. Run Map Design.

For Firm Macro, the post-MAP macro design with placement constraint is merged into your design.

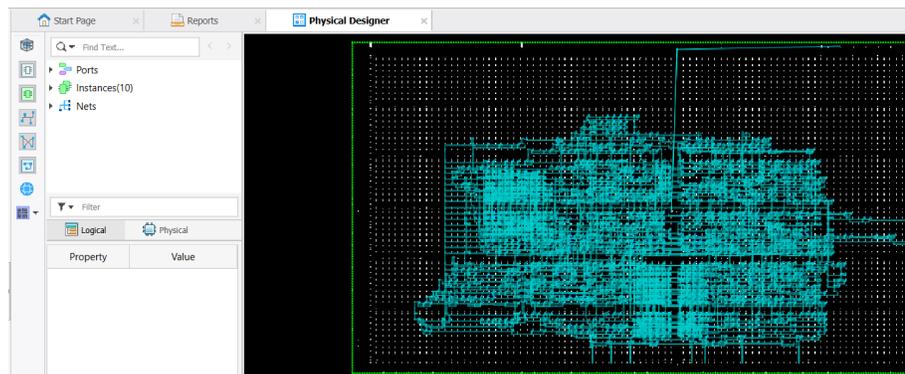

For Hard Macro, the post-MAP macro design with placement and route constraint is merged into your design.

Open **Physical Designer**, the netlist shows the reused macro instances. They contain information of the original region from the create stage.

12. Run Place & Route Design.

Open **Physical Designer** and select **Routing Mode** to see the macro instances in the physical netlist.

Summary of Accomplishments

You have completed the *Lattice Radiant Block-Based Design Tutorial*. In this tutorial, you have learned how to:

- ▶ Create a macro block in Pre-Synthesis Constraint Editor.
- ▶ Create a macro region in Physical Designer
- ▶ Export Macro using three preservation levels
 - ▶ Logical (Logic Macro)
 - ▶ Logical & Physical with Place Info (Firm Macro)
 - ▶ Logical & Physical with Placement & Routing Info (Hard Macro)
- ▶ View the macro IPM package content
- ▶ Import existing .ipm files for macro reuse.
- ▶ Change the preservation level value of .ipm files.
