

# 2.5G Ethernet IP

IP Version: v1.1.0

## User Guide

FPGA-IPUG-02293-1.4

February 2026

## Disclaimers

Lattice makes no warranty, representation, or guarantee regarding the accuracy of information contained in this document or the suitability of its products for any particular purpose. All information herein is provided AS IS, with all faults, and all associated risk is the responsibility entirely of the Buyer. The information provided herein is for informational purposes only and may contain technical inaccuracies or omissions, and may be otherwise rendered inaccurate for many reasons, and Lattice assumes no obligation to update or otherwise correct or revise this information. Products sold by Lattice have been subject to limited testing and it is the Buyer's responsibility to independently determine the suitability of any products and to test and verify the same. LATTICE PRODUCTS AND SERVICES ARE NOT DESIGNED, MANUFACTURED, OR TESTED FOR USE IN LIFE OR SAFETY CRITICAL SYSTEMS, HAZARDOUS ENVIRONMENTS, OR ANY OTHER ENVIRONMENTS REQUIRING FAIL-SAFE PERFORMANCE, INCLUDING ANY APPLICATION IN WHICH THE FAILURE OF THE PRODUCT OR SERVICE COULD LEAD TO DEATH, PERSONAL INJURY, SEVERE PROPERTY DAMAGE OR ENVIRONMENTAL HARM (COLLECTIVELY, "HIGH-RISK USES"). FURTHER, BUYER MUST TAKE PRUDENT STEPS TO PROTECT AGAINST PRODUCT AND SERVICE FAILURES, INCLUDING PROVIDING APPROPRIATE REDUNDANCIES, FAIL-SAFE FEATURES, AND/OR SHUT-DOWN MECHANISMS. LATTICE EXPRESSLY DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY OF FITNESS OF THE PRODUCTS OR SERVICES FOR HIGH-RISK USES. The information provided in this document is proprietary to Lattice Semiconductor, and Lattice reserves the right to make any changes to the information in this document or to any products at any time without notice.

## Inclusive Language

This document was created consistent with Lattice Semiconductor's inclusive language policy. In some cases, the language in underlying tools and other items may not yet have been updated. Please refer to Lattice's inclusive language [FAQ 6878](#) for a cross reference of terms. Note in some cases such as register names and state names it has been necessary to continue to utilize older terminology for compatibility.

## Abbreviations in This Document

A list of abbreviations used in this document.

Abbreviations	Definition
APB	Advanced Peripheral Bus
AXI4-Lite	Advanced eXtensible Interface 4 Lite
AXI4-Stream/AXI4S	Advanced eXtensible Interface 4 Stream
CRC	Cyclic Redundancy Check
DA	Destination Address
DIC	Deficit Idle Count
EBR	Embedded Block RAM
FCS	Frame Check Sequence
FIFO	First-In First-Out
GMII	Gigabit Media Independent Interface
GPLL	Generic Phase-Locked Loop
IEEE	Institute of Electrical and Electronics Engineers
IFG	Inter-Frame Gap
LUT	Look-Up Table
L/T	Length/Type
MAC	Media Access Controller
MDIO	Management Data Input/Output
MMD	MDIO Manageable Device
MTU	Maximum Transmission Unit
PCS	Physical Coding Sublayer
PHY	Physical Layer Device
PMA	Physical Medium Attachment
SA	Source Address
SFD	Start Frame Delimiter
SOF	Start of Frame

# 1. Introduction

## 1.1. Overview of the IP

The Lattice 2.5G Ethernet IP core implements the Media Access Controller (MAC) and state machine functions for the Physical Coding Sub-layer (PCS) described in the IEEE 802.3 (1000BASE-X) specification. Note that the IEEE specification describes a PCS that operates at 1 Gbps. Therefore, this 2.5G PCS state machine does not conform to the IEEE standard specification. The two major differences are data rate (2.5 Gbps instead of 1 Gbps) and 16-bits GMII data bus width.

This 2.5G Ethernet IP core supports the ability to transmit and receive data between a host processor and an Ethernet network. The main function of the Ethernet MAC is to ensure that the Media Access rules specified in the IEEE 802.3 standard are met while transmitting a frame of data over Ethernet. On the receiving side, Ethernet MAC extracts the different components of a frame and transfers them to higher applications through the FIFO interface. The Lattice 2.5G IP cores are 100% compatible and can be used to create a full PHY/MAC Ethernet data path that operates at 2.5 Gbps.

This document describes the 2.5G Ethernet IP core operation and provides instructions for generating the core through the Lattice Radiant™ software. This document also provides guidance on instantiating, synthesizing, and simulating the core.

## 1.2. Quick Facts

**Table 1.1. Summary of the 2.5G Ethernet IP Core**

<b>IP Requirements</b>	Supported Devices	CertusPro™-NX	Avant™-AT-G and Avant-AT-X
	IP Option	<ul style="list-style-type: none"> <li>• MAC only</li> <li>• PHY only</li> <li>• MAC + PHY</li> </ul>	
	IP Changes <sup>1</sup>	For a list of changes to the IP, refer to the <a href="#">2.5G Ethernet IP Release Notes (FPGA-RN-02083)</a> .	
<b>Resource Utilization</b>	Supported User Interface	AXI4-Stream, APB, and AXI4-Lite.	
	Resources	See <a href="#">Appendix A. Resource Utilization</a> .	
<b>Design Tool Support</b>	Lattice Implementation	IP core v1.1.0—Lattice Radiant™ software 2025.2 or later.	
	Synthesis	Synopsys® Synplify Pro® software, O-2018.09LR-SP1.	
	Simulation	For the list of supported simulators, see the Lattice Radiant Software User Guide on the <a href="#">Lattice Radiant Software</a> web page.	
<b>Driver Support</b>	API Reference	Refer to the <a href="#">2.5G, 10G, and 25G Ethernet Driver API Reference (FPGA-TN-02375)</a> .	

**Note:**

1. In some instances, the IP may be updated without changes to the user guide. This user guide may reflect an earlier IP version but remains fully compatible with the later IP version. Refer to the IP Release Notes for the latest updates.

## 1.3. Features

The 2.5G Ethernet IP core offers the following key features:

**MAC**

- Compliant to IEEE 802.3-2005 standard
- Full-duplex operation
- Independent TX and RX Maximum Transmission Unit (MTU) frame length
- Programmable promiscuous (transparent) mode
- Supports deficit idle count (DIC)
- Advanced Peripheral Bus (APB) interface for register access
- Transmit and receive statistics vector
- Multicast address filtering
- Supports the following frame features:

- Full-duplex control using PAUSE frames
- VLAN tagged frames
- Automatic padding of short frames
- Multicast and Broadcast frames
- Optional FCS transmission and reception
- Jumbo frames of 9,600 bytes

PHY

- Implements the transmit and receive functions described in Clause 36 of IEEE 802.3
- 16-bits GMII interface operating at 156.25 MHz (2.5 Gbps)
- Parallel signal interface for control and status management
- Supports standard 2.5 Gbps Ethernet link layer data rate
- 8b/10b encoding and decoding support
- Auto negotiation with link configuration functions described in Clause 37 of IEEE 802.3

Other Features

- Supports driver codes for the Propel™ Builder software

## 1.4. Licensing and Ordering Information

The 2.5G Ethernet IP is available with Lattice Radiant Subscription Software. To purchase the Lattice Radiant Subscription license, contact [Lattice Sales](#) or go to the [Lattice Online Store](#).

## 1.5. IP Validation Summary

The following table provides IP support information on the 2.5G Ethernet IP core.

**Table 1.2. 2.5G Ethernet IP Support Readiness**

Device Family	Mode	Radiant Timing Model	Hardware Validated
CertusPro-NX	MAC only, PHY only, MAC + PHY	Final	Yes
Avant-AT-G/X	MAC only, PHY only, MAC + PHY	Preliminary	Yes

## 1.6. Minimum Device Requirements

The minimum device requirements for the 2.5G Ethernet IP are as follows:

**Table 1.3. Minimum Device Requirements for 2.5G Ethernet IP Core**

Devices	Speed Grades
CertusPro-NX (LFCPNX-50/100)	Speed grade 7*
Avant-AT-G/X	All speed grades

\*Note: For CertusPro-NX devices, speed grade 7 supports the IP only in its default mode with no optional GUI features or parameters enabled. Speed grade 8 and 9 support all optional features or parameters in the GUI that are enabled.

## 1.7. Naming Conventions

### 1.7.1. Nomenclature

The nomenclature used in this document is based on Verilog HDL.

### 1.7.2. Signal Names

- `_n` are active low signals (asserted when value is logic 0)
- `_i` are input signals
- `_o` are output signals
- `_io` are bi-directional input/output signals

## 2. Functional Description

### 2.1. MAC + PHY (CertusPro-NX Device)

#### 2.1.1. IP Architecture Overview

The 2.5G Ethernet IP core is a fully synchronous machine composed of Transmit and Receive sections that operate independently to support full duplex operation between host processor and Ethernet network. With the MAC + PHY option selected, the IP consists of a MAC and a PHY that is connected through the 16-bit GMII internally. This IP option is supported by CertusPro-NX devices.

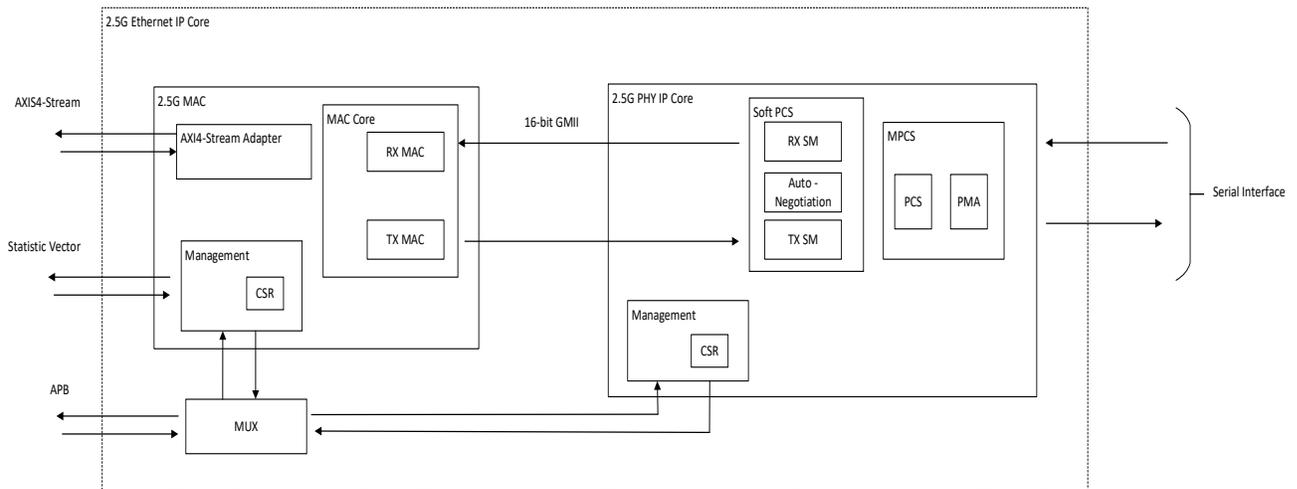

Figure 2.1. 2.5G Ethernet IP Core Block Diagram

The 2.5G Ethernet IP core includes the following layers:

- Physical layer
- MAC layer

#### 2.1.2. Management Block

The Management block can be accessed through the APB interface when the *MAC + PHY* option is selected.

For more details about the management blocks in MAC and PHY respectively, refer to the [MAC Management Block](#) and [PHY Management Block \(CertusPro-NX\)](#) sections. For protocol timing details, refer to AMBA 3 APB Protocol version 1.0 Specification.

### 2.2. MAC + PHY (Avant Device)

#### 2.2.1. IP Architecture Overview

The 2.5G Ethernet IP core transmits and receives data between a host processor and an Ethernet network. With the *MAC + PHY* option selected, the IP consists of a MAC and a PHY that is connected through the 16-bit GMII internally.

This IP option is supported on Avant-AT-G and Avant-AT-X devices.

For Lane Merging details, refer to the [Lane Merging \(Avant Devices\)](#) section.

## 2.2.2. Block Diagram

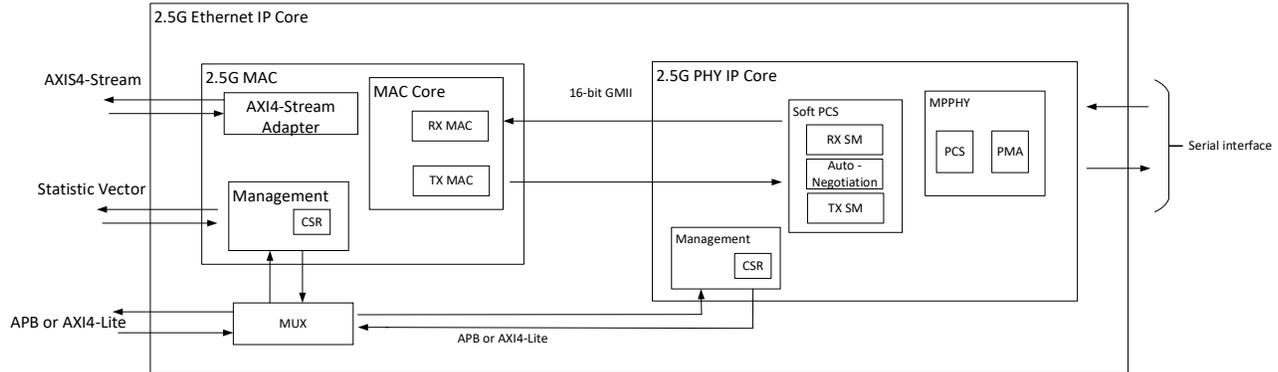

Figure 2.2. 2.5G IP Core Block Diagram

## 2.2.3. Management Block

The Management block can be accessed through the AXI4-Lite or APB interface when the *MAC + PHY* option is selected. For more details about the management blocks in MAC and PHY respectively, refer to the [MAC Management Block](#) and [PHY Management Block \(Avant Device\)](#) sections. For protocol timing details, refer to AMBA 4 AXI and ACE Protocol Specification issue H or AMBA 3 APB Protocol version 1.0 Specification.

## 2.3. MAC

### 2.3.1. IP Architecture Overview

The 2.5G MAC Only IP option core transmits and receives data between a client application and an Ethernet network. The main function of the Ethernet MAC is to ensure that the Media Access rules specified in the IEEE 802.3 standard are met while transmitting and receiving Ethernet frames. [Figure 2.4](#), [Figure 2.5](#), and [Figure 2.6](#) show some of the frame formats of data transmitted and received on the Ethernet network that the 2.5G MAC Only IP option core supports.

On the receiving side, the Ethernet MAC extracts the different components of a frame and transfers them to higher applications through the client FIFO interface.

The data received from the GMII interface is first buffered until sufficient data is available to be processed by the Receive MAC (RX MAC). The Preamble and the Start-of-Frame Delimiter (SFD) information are then extracted from the incoming frame to determine the start of a valid frame. The Receive MAC checks the address of the received packet and validates whether the frame can be received before transferring it into the FIFO (runts and fragments are discarded). The RX MAC also provides a statistical vector on a per packet basis that can be used by the application. The 2.5G MAC Only IP option core always calculates CRC to check whether the frame was received error-free.

On the transmit side, the TX MAC is responsible for controlling access to the physical medium. The TX MAC reads data from an external client TX FIFO, formats this data into an Ethernet packet, and passes it to the GMII module.

The TX MAC reads data from the TX Client FIFO when the client indicates a packet is available, and the TX MAC is in its appropriate state. The TX MAC pre-fixes the Preamble and the SFD information to the data and appends the Frame Check Sequence at the end of the data.

### 2.3.2. Block Diagram

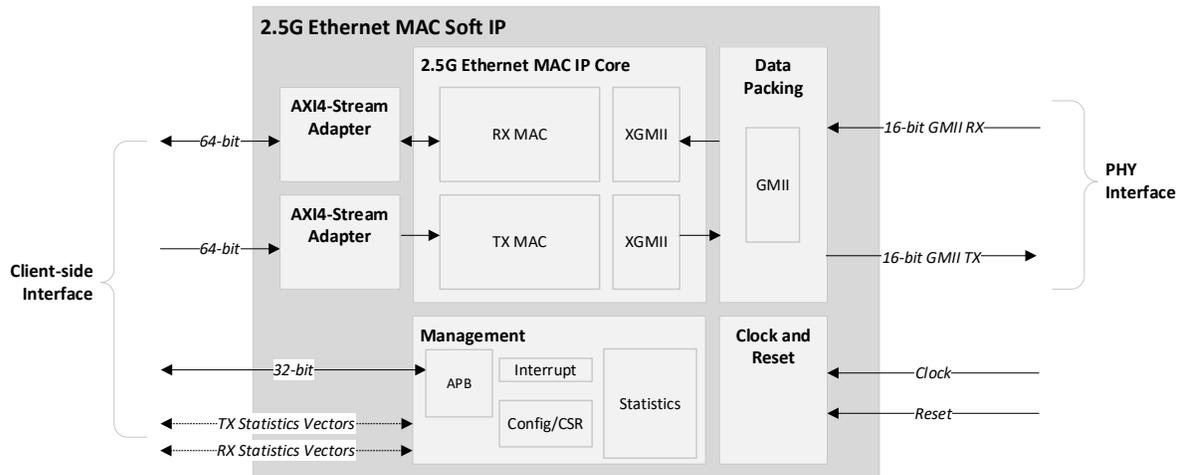

Figure 2.3. 2.5G MAC Only Block Diagram

### 2.3.3. Ethernet Data Format

The following figure shows an untagged Ethernet frame format.

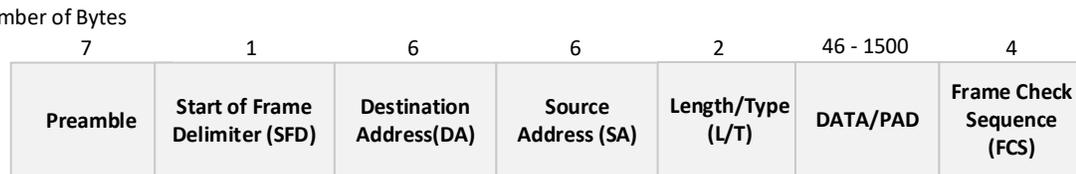

Figure 2.4. Untagged Ethernet Frame Format

The following figure shows a tagged Ethernet frame format.

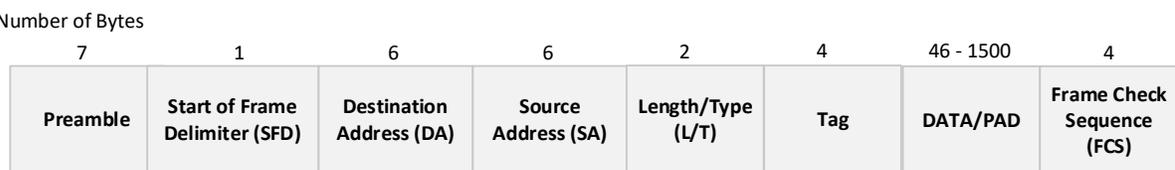

Figure 2.5. Tagged Ethernet Frame Format

The following figure shows Ethernet Control Pause Frame Format

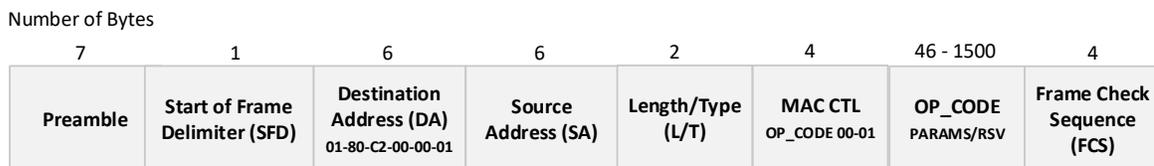

Figure 2.6. Pause Frame Format

A Tagged frame includes a 4-byte VLAN Tag field, which is located between the Source Address field and the Length/Type field. The VLAN Tag field includes the VLAN Identifier and other control information needed when operating with Virtual Bridged LANs as described in IEEE 802.1Q.

The MAC is responsible for constructing a valid frame from the data received from the client before transmitting it. On the receiver path, it receives frames from the network through the 16-bit GMII interface and passes the parameters of the frame to the client through the AXI4-Stream interface.

Note that the 2.5G MAC GMII interface uses a 16-bit data interface. Although this interface conforms to the timing specified in IEEE 802.3 Clause 35, the data bus width and clock frequency do not conform to the IEEE standard. To overcome this issue, Lattice provides a 2.5G PHY IP OPTION core with a 16-bit datapath and 156.25 MHz clock that is directly compatible with the 2.5G MAC GMII interface as shown in [Figure 2.1](#).

### 2.3.4. Receive MAC

The Receive MAC receives the incoming frames and transfers them to the client via the AXI4-Stream interface. In the process, it performs the following operations:

- Checks the frame for a valid start of frame (SOF) and SFD symbol.
- Determines whether the frame should be received by analyzing the DA.
- Determines the type of the frame by analyzing the length/type field.
- Checks for any errors in the frame by recalculating the CRC and comparing it with the expected value.

The RX MAC operation is determined by programming the MODE and RX\_CTL registers.

You can specify whether the FCS field should be transferred on to the AXI4-Stream interface by programming the rx\_pass\_fcs bit of RX\_CTL register. If the FCS field is to be stripped off the frame, any padding bytes within the frame are stripped off as well.

Once a valid SOF is detected, the DA field of the incoming frame is analyzed. If the DA field is a unicast address, it is compared with the programmed MAC address. Unless the prms bit of RX\_CTL register was set, the incoming frame is discarded if the DA field and the programmed MAC address (MAC\_ADDR\_{0,1} registers) do not match. If the frame had a multicast address and if receive\_all\_mc signal is not asserted, all such frames are dropped (except PAUSE frames). If the frame had a multicast address and if receive\_all\_mc signal is asserted, the multicast frames are subject to the following address filtering rules:

For all frames with multicast address, the CRC of the destination address is computed and the mid-six bits of the least significant byte of the CRC is chosen as the address to a hash table. The 64-bit hash table is programmed in the MC\_TABLE\_{0,1} registers. The MAC implements an eight-row table with eight bits in each row. The lower three bits of the selected CRC are used to select one of these eight rows and the next three bits are used to select one of the bits in the selected table. The incoming multicast frame is accepted if the bit selected from the hash table is set to one. It is discarded if the bit selected is zero.

If the incoming frame had a broadcast address, it is accepted if either the prms or the receive\_bc bit of RX\_CTL register is set. A broadcast frame is discarded if none of these bits are set.

### 2.3.5. Transmit MAC

The Transmit MAC controls access to the physical medium. Its main functions are as follows:

- Data padding for short frames when FCS generation is enabled.
- Generation of a pause frame when the tx\_pausreq bit of MAC\_CTL register is asserted. The bit tx\_fc\_en of TX\_CTL register should be set to 1 to enable this feature.
- To stop frame transmission when a pause frame is received by the Receive MAC.
- Implement link fault signaling logic and transmit appropriate sequences based on the remote link status of the TX\_RX\_STS register.

The TX MAC operation is determined by programming the MODE and TX\_CTL registers.

By default, the Transmit MAC is configured to generate the FCS pattern for the frame to be transmitted. However, this can be prevented by setting tx\_pass\_fcs bit of the TX\_CTL register. This feature is useful if the frames being presented for transmission already contain the FCS field. When FCS field generation by the MAC is disabled, ensure that short frames are properly padded before the FCS is generated. If the MAC receives a frame to transmit that is shorter than 64 bytes when FCS generation is disabled, the frame is sent as is and a statistic vector for the condition is generated.

The DA, SA, L/T, and data fields are derived from higher applications through the AXI4-Stream interface and then encapsulated into an un-tagged Ethernet frame. The frame encapsulation consists of adding the preamble bits, the SFD bits, and the CRC check sum to the end of the frame. If transmit\_short bit of TX\_CTL register is not set, all short frames are padded.

The frame is not sent over the network until the network has been idle for a minimum of Inter-Packet Gap (IPG). The TX MAC requires a continuous stream of data for the entire frame. There cannot be any bubbles of no data transfer within a frame. After the TX MAC is done transmitting a frame, it waits for more frames from the AXI4-Stream interface. During this time, it goes to an idle state that can be detected by reading the TX\_RX\_STS register. Because the MODE register can be written at any time, the TX MAC can be disabled while it is actively transmitting a frame. In such cases, the MAC completely transmits the current frame and then return to the idle state. The control registers should be programmed only after the MAC has returned to the IDLE state.

There are two different methods for transmitting a pause frame. In the first method, the application layer forms a pause frame and submits it for transmission via the AXI4-Stream interface. In the other method, the application layer signals the TX MAC directly to transmit a pause frame. This is accomplished by asserting tx\_pausreq bit of MAC\_CTL register. In this case, the TX MAC completes the transmission of the current packet and then transmit a pause frame with the pause time value supplied through the tx\_paustim bits of the PAUSE\_TMR register.

### 2.3.6. Receive AXI4-Stream Interface

The receive client-side interface supports the AXI4-Stream interface.

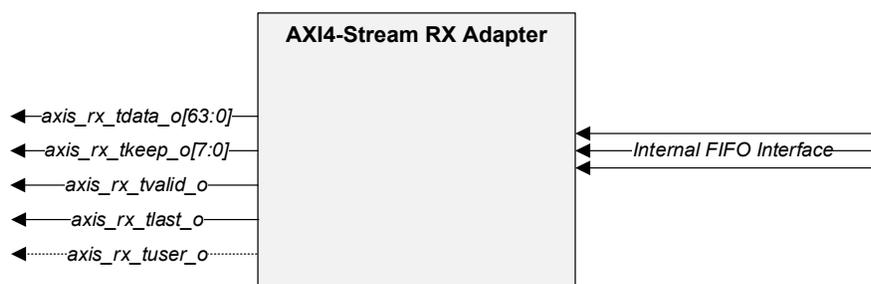

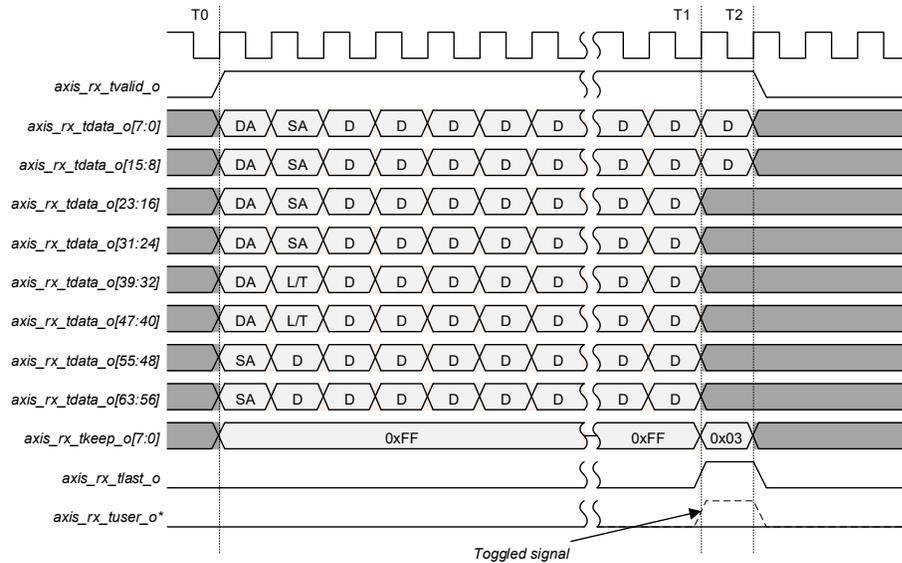

Figure 2.7. AXI4-Stream RX Adapter Interface Diagram

#### 2.3.6.1. Default Normal Frame

The following figure shows the timing diagram of a default normal frame at the Receive AXI4-Stream interface:

- T0: MAC asserts axis\_rx\_tvalid\_o to indicate start of frame. The valid packet includes from the DA field up to the end of the data field.
- T1: MAC asserts axis\_rx\_tlast\_o to indicate last packet transfer.
- T2: MAC deasserts axis\_rx\_tvalid\_o when there is no next packet transfer.

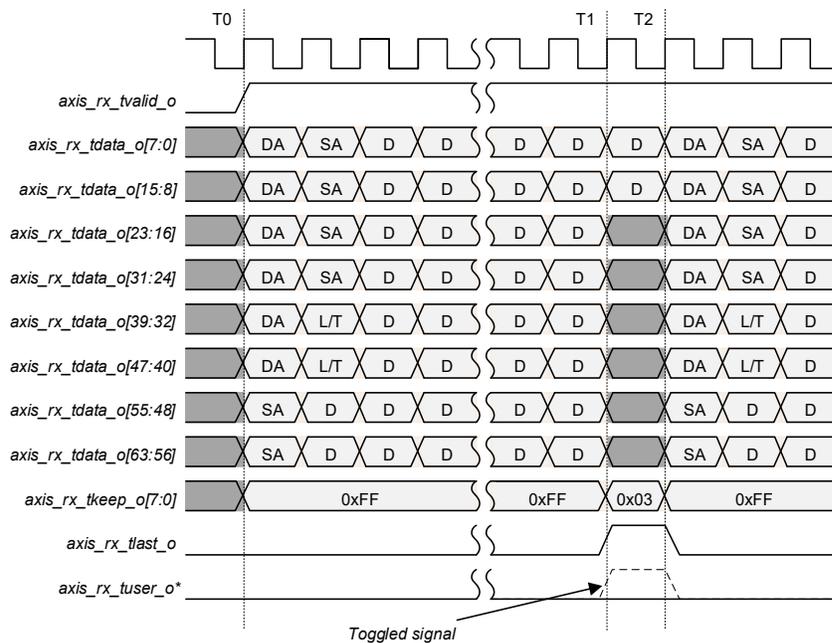

**Figure 2.8. Normal Frame Reception**

**\* Note:** Under normal circumstances, the `axis_rx_tuser_o` signal must not be asserted when there is no error. However, if an error occurs and the `axis_rx_tuser_o` signal is toggled, you must check on the status signal—`rx_statvec_o` signal.

### 2.3.6.2. Back-to-back Normal Frame

The following figure shows the timing diagram of a back-to-back frame at the Receive AXI4-Stream interface:

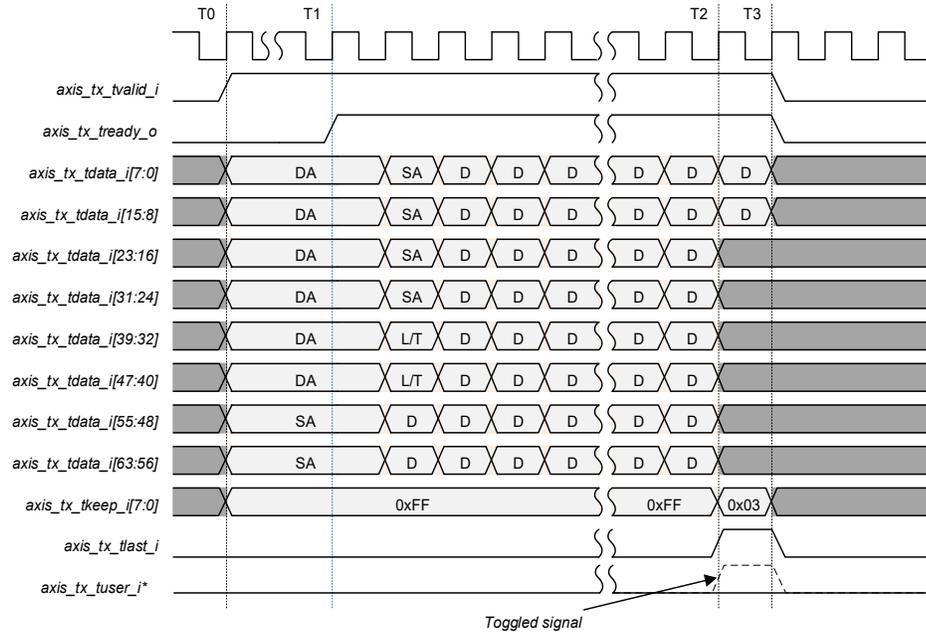

- T0: MAC asserts `axis_rx_tvalid_o` to indicate start of frame. The valid packet starts from the DA field up to the end of the data field.
- T1: MAC asserts `axis_rx_tlast_o` to indicate last packet transfer.
- T2: MAC still asserts the `axis_rx_tvalid_o` to indicate another packet transfer.

**Figure 2.9. Back-to-back Normal Frame Reception**

- T3: Client deasserts `axis_tx_tvalid_i` when there is no packet transfer. Transmit MAC also deasserts `axis_tx_tready_o` once it sees the last packet transfer (`axis_tx_tlast_i = 1`).

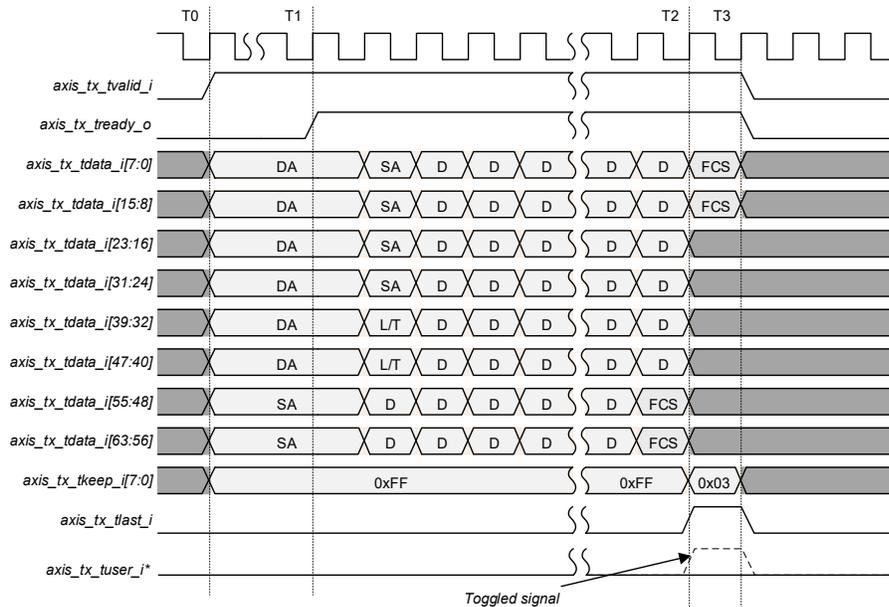

**Figure 2.12. Default Normal Frame Transmission**

\* **Note:** You can inject the error by asserting the `axis_tx_tuser_i` signal during EOP. Otherwise, the `axis_tx_tuser_i` signal must drive to low.

### 2.3.7.2. In-Band FCS Passing

The following figure shows the timing diagram of a frame when In-Band FCS passing is enabled.

**Figure 2.13. Transmission with In-Band FCS Passing**

\* **Note:** You can inject the error by asserting the `axis_tx_tuser_i` signal during EOP. Otherwise, the `axis_tx_tuser_i` signal must drive to low.

### 2.3.8. MAC Management Block

The MAC Management block is accessed through the APB interface. This block is responsible for the following:

- Configuration of the core
- Access to interrupt block
- Access to statistics counter

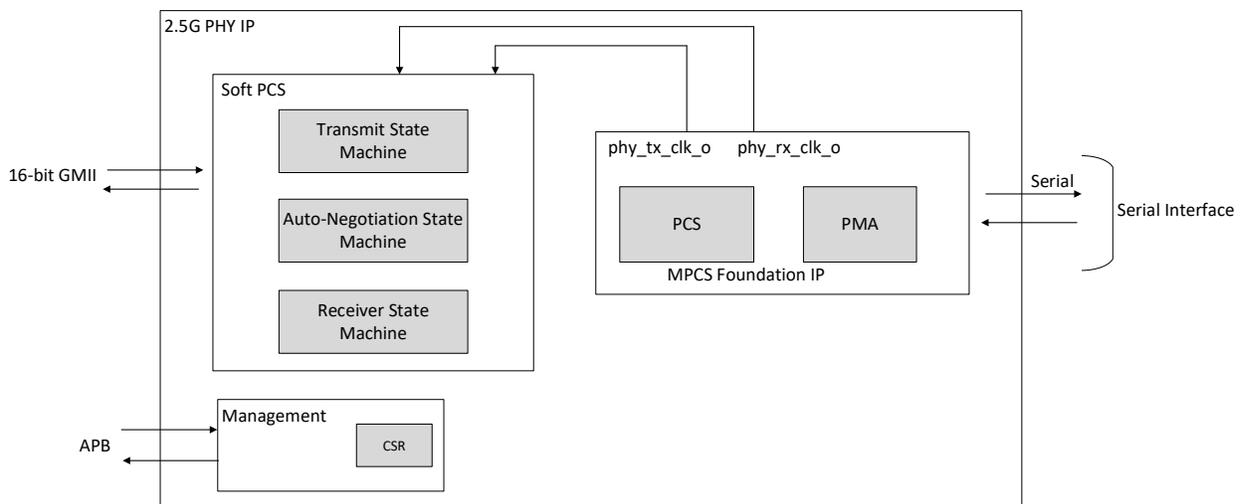

The various events that occur during the reception of a frame are also logged into the statistics vector signals (`rx_statvec_o`) and the `TX_RX_STS` register. At the end of reception, the `rx_staten_o` signal is asserted to qualify the `rx_statvec_o` signal. A vector is not generated for all those frames that are discarded (no address match or frame length is less than 64 bytes) or ignored (you assert the `ignore_pkt` of `MAC_CTL` register). For every frame transmitted, a statistics vector signals (`tx_statvec_o`) is generated, including all the statistical information collected in the process of transmitting the frame. Data on `tx_statvec_o` is qualified by assertion of the `tx_staten_o` signal. These statistics can also be accessed in the statistics counter when the *Statistics Counter Register* attribute is enabled.

For the timing details of the AMBA 3 APB protocol, refer to the AMBA 3 APB Protocol version 1.0 Specification.

## 2.4. PHY (CertusPro-NX Devices)

### 2.4.1. IP Architecture Overview

The CertusPro-NX 2.5G Ethernet PHY IP core provides the 16-bit GMII interface to the MAC and follows the IEEE 802.3 standard. It supports 16-bit of data and 2-bit of control signals for both transmit and receive path.

**Figure 2.14. 2.5G PHY Only Architecture Diagram**

This IP core instantiates the MPCS Module foundation IP configured as single lane 8b/10b Encoder/Decoder and supports APB access to MPCS and MMD registers. For more information on MPCS Module foundation IP, refer to the [MPCS Module User Guide \(FPGA-IPUG-02118\)](#).

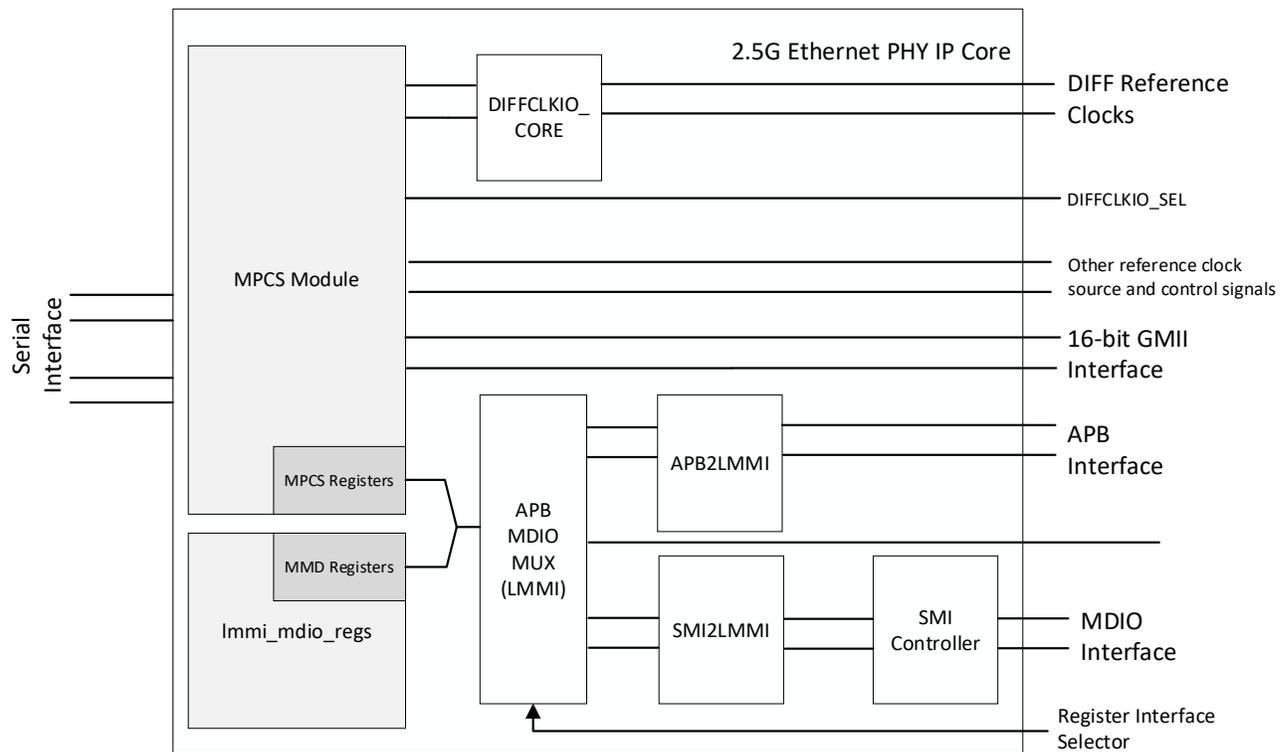

Figure 2.15. CertusPro-NX 2.5G Ethernet PHY Only Top-Level Block Diagram

### 2.4.2. Lane Merging (CertusPro-NX Device)

For more information on Lane Merging for CertusPro-NX, refer to the MPCS Component Merging and Lane Mapping section in the [MPCS Module User Guide \(FPGA-IPUG-02118\)](#).

### 2.4.3. Reference Clocks

The CertusPro-NX 2.5G Ethernet PHY IP core provides other sources of reference clocks and can be used for dynamic switching. The `pll_0/1_refclk_i` must only be connected to PLL and must not be directly connected to the fabric. To use this feature, you must set the reference clock source control signals according to the following table.

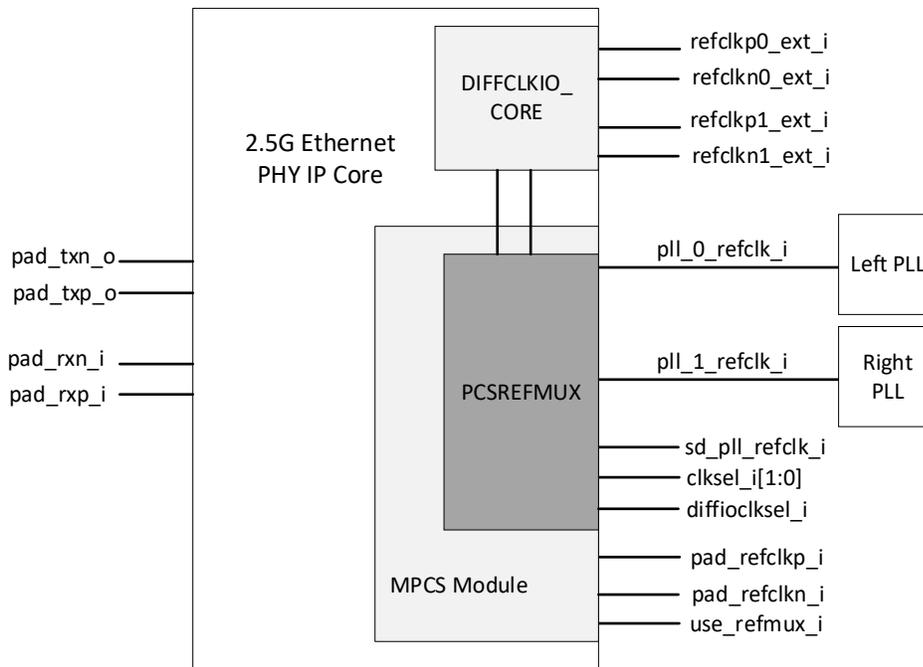

Figure 2.16. Reference Clock Block Diagram

Table 2.1. Reference Clock MUX Tree Control Signals

Reference Clock Control Signal	Usage
use_refmux_i	1'b1 – Use reference clock output from Clock MUX Tree (PCSREFMUX). 1'b0 – Use dedicated reference clocks (pad_refclkp/n_i).
diffiocksel_i	1'b1 – Use refclkp/n1_ext_i as reference clocks. 1'b0 – Use refclkp/n0_ext_i as reference clocks.
clksel_i	2'b00 – Use pll_0_refclk_i as reference clocks. 2'b01 – Use pll_1_refclk_i as reference clocks. 2'b10 – Use reference clock based on diffiocksel_i. 2'b11 – Use sd_pll_refclk_i as reference clock.

### 2.4.4. Transmit State Machine

The transmit state machine implements the transmit functions described in clause 36 of the IEEE 802.3 specification. The state machine's main purpose is to convert GMII data frames into code groups. A typical timing diagram for this circuit block is shown in Figure 2.17. Note that the state machine in this IP core does not fully implement the conversion to 10-bit code groups as specified in the IEEE 802.3 specification. Instead, partial conversion to 8-bit code groups is performed. A separate encoder in the Lattice SERDES completes the full conversion to 10-bit code groups.

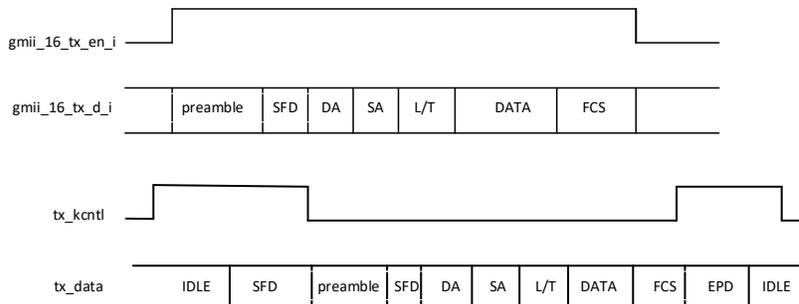

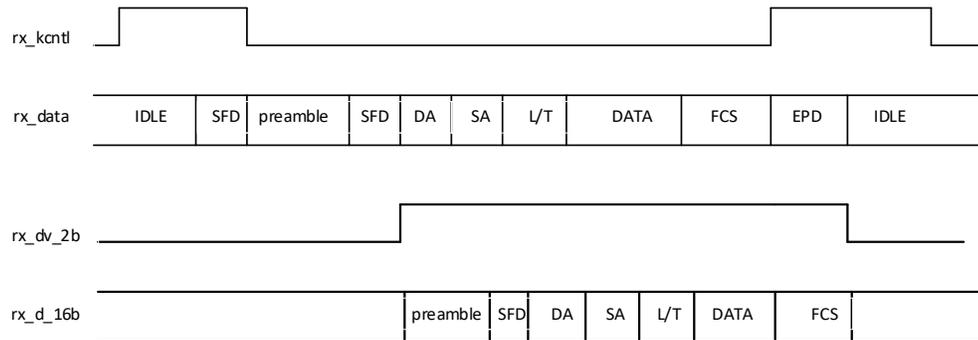

Figure 2.17. Typical Transmit Timing Diagram

### 2.4.5. Receive State Machine

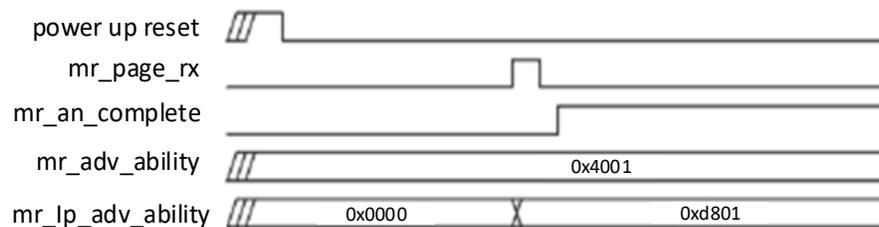

The receive state machine implements the receive functions described in clause 36 of the IEEE 802.3 specification. The state machine's main purpose is to convert code groups into GMII data frames. A typical timing diagram for this circuit block is shown in [Figure 2.18](#). Note that the state machine in this IP core does not fully implement the conversion from 10-bit code groups as specified in the IEEE 802.3 specification. Instead, partial conversion from 8-bit code groups is performed. A separate decoder in the Lattice SERDES performs 10-bit to 8-bit code group conversions.

**Figure 2.18. Typical Receive Timing Diagram**

### 2.4.6. Auto-Negotiation State Machine

The auto-negotiation state machine implements the link configuration functions described in clause 37 of IEEE 802.3 specification. Refer to the IEEE specification for a detailed description of auto-negotiation operation. From a high-level view, the primary auto-negotiation functions are checking the physical link for proper operation and passing link configuration information between Ethernet PHYs sitting on both sides of the link.

**Figure 2.19. Typical Auto-Negotiation Timing Diagram for MAC-Side Entity**

### 2.4.7. PHY Management Block (CertusPro-NX)

The PHY Management block is accessed through the APB interface. This block is responsible for register access of the PCS registers. For details of the PCS register access, refer to the [Register Description](#) section.

## 2.4.8. PCS Loopback

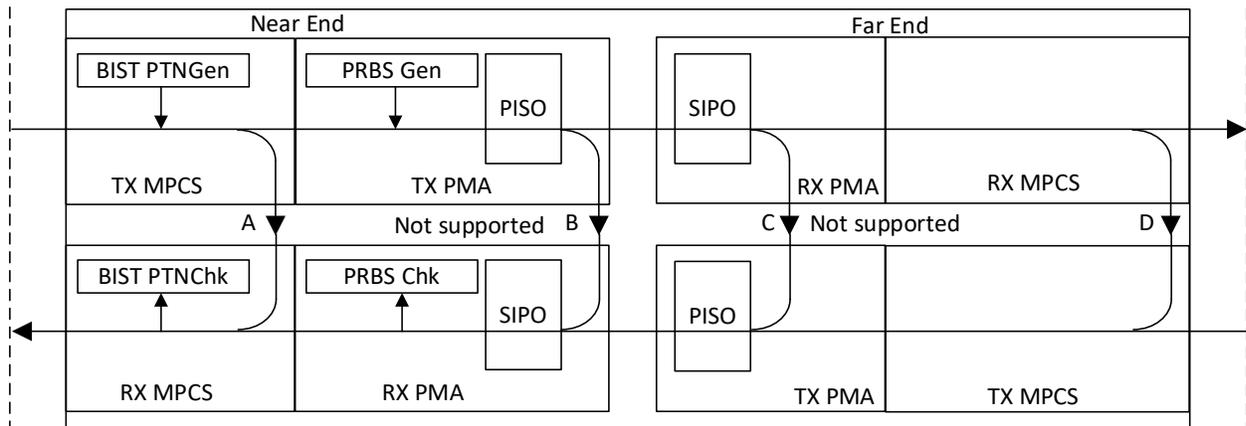

Figure 2.20. 8b10b PCS Loopback Diagram

The following lists the various types of PCS loopback:

- Loopback A – This loopback can be enabled when Loopback = 8b/10b PCS Near-End Parallel Loopback Mode.
- Loopback B – Not supported.
- Loopback C – Not supported.
- Loopback D – This loopback can be enabled when Loopback = 8b/10b PCS Far-End Parallel Loopback Mode.

## 2.5. PHY (Avant Devices)

### 2.5.1. IP Architecture Overview

The Avant 2.5G Ethernet PHY IP core provides the 16-bit GMII interface to the MAC and follows the IEEE 802.3 standard. It supports 16-bit of data and 2-bit of control signals for both transmit and receive path. This IP core instantiates the MPPHY foundation IP configured as 1-Lane 8b/10b PCS and a Management block that supports AXI4-Lite and APB access to PCS and MMD registers. For more information on MPPHY foundation IP, refer to the [Lattice Avant SERDES/PCS User Guide \(FPGA-TN-02313\)](#). The functional description in this section is only applicable for 2.5G Ethernet PHY IP core on Avant-AT-G and Avant-AT-X devices.

### 2.5.2. Block Diagram

The following figure shows the top-level block diagram of the 2.5G Ethernet PHY IP core.

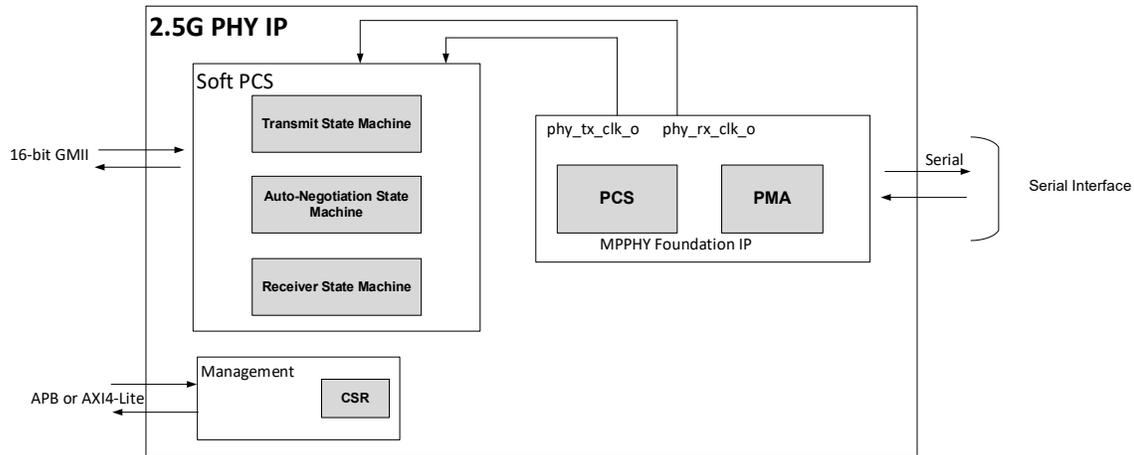

Figure 2.21. 2.5G Ethernet PHY IP Core Block Diagram

### 2.5.3. Lane Merging (Avant Devices)

#### 2.5.3.1. Overview

The LAV-AT-G/X70 silicon can have up to seven usable quads while the LAV-AT-G/X30 silicon has up to three usable quads depending on the package. Each MPPHY block is a quad made up of four lanes (X4). Therefore, a single device could theoretically contain up to 28 lanes across seven quads.

You can configure the quad to use each lane individually, enabling you to merge multiple MPPHY instances into a single physical quad. This maximizes the usage of silicon resources in your design.

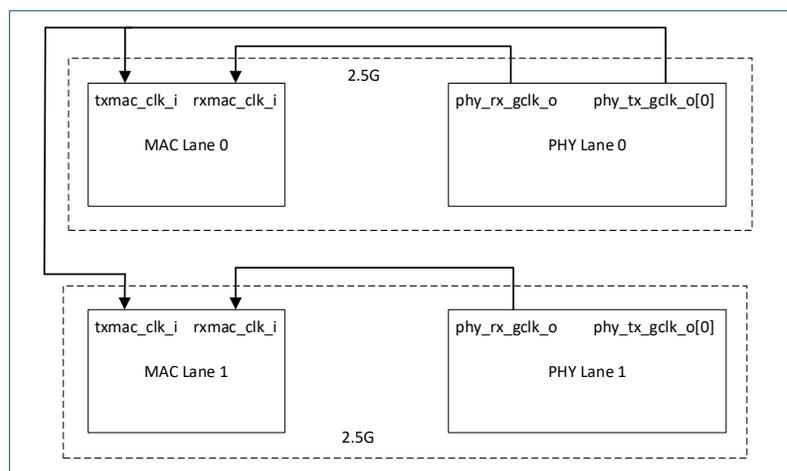

Figure 2.22. Lane Merging Example for Avant Devices

**Note:** For more information, refer to the [Lattice Avant-G/X MPPHY Module User Guide \(FPGA-IPUG-02233\)](#).

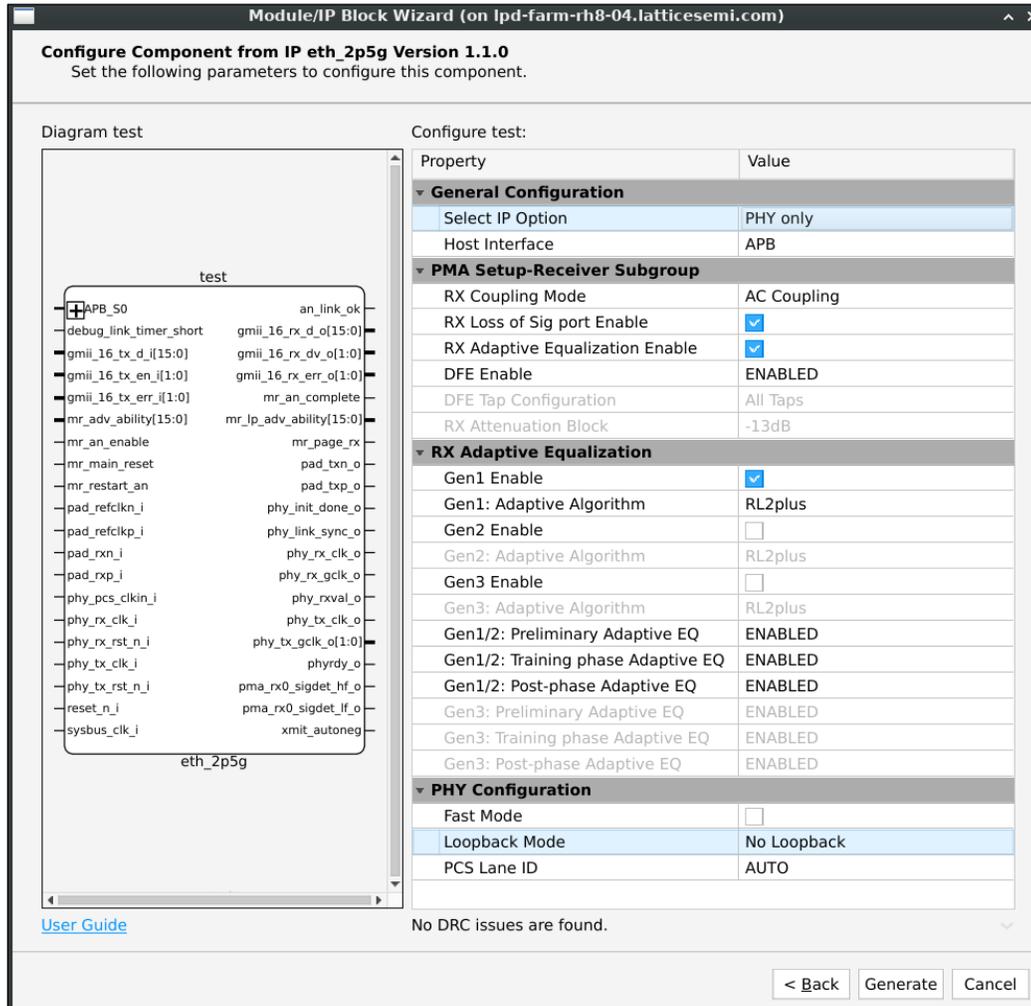

#### 2.5.3.2. Usage

The 2.5G Ethernet PHY IP core instantiates the MPPHY foundation IP configured with a 1X1 link width, which occupies a single lane of a quad. By default, Radiant software attempts to merge MPPHY instances to minimize the device power consumption.

If you want to override this behavior and select specific locations for the MPPHY instances, you can set the LANE ID configuration of the IP according to the number of quads you want to use.

To set the Lane ID, follow these steps:

1. In the Select IP Option field, select **PHY only** or **MAC + PHY**.
2. In the PCS Lane ID field, set the lane ID configuration of the IP as shown in the figure below. By default, the ID is set to **AUTO**. If the **AUTO** Lane ID is selected, the pin location assignment must be included in the sdc or ldc constraint file. If the ID is not set to **AUTO**, in the case of a conflict between the Lane ID configuration and a top-level design port constraint, the top-level design port constraint takes precedence, which means the Lane ID setting is ignored and a warning message is shown.

**Figure 2.23. Set the Lane ID Configuration of the 2.5G Ethernet PHY IP Core**

The Lane ID value is global for the entire device, starting at 0 from Lane 0 of the left-most quad, then incrementing up to 27 for Lane 3 of the right-most quad for the largest package of LAV-AT-G/X70. An example of Lane ID numbering is shown in the figure below.

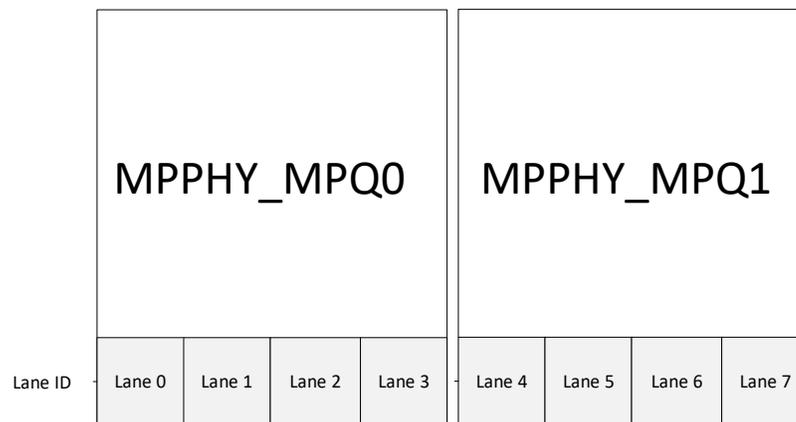

Figure 2.24. Lane ID Numbering

### 2.5.3.3. Lane Merging Report

During lane merging, the Post-Synthesis process produces a report file named *mpphy\_lane\_assignment.mrf* in the project’s active implementation folder that shows how the MPPHY design instances were merged into the device MPPHY quads. You can open the report file with any text editor.

```

MPPHYX4_MPQ0: new instance 'MPPHYX4_MPQ0_merge'
  ~~ Lane Assignment Within Quad ~~
    Lane 3: -- un-assigned --
    Lane 2: -- un-assigned --
    Lane 1: 'inst_1/lsc2p5_gbe_top_inst/genblk1.lsc2p5_gbephy_inst/mpphy_03A_inst/lsc2p5_mpphy_inst/mpp_nonpipe_x1.u_nonpipe_x1' (MPPHY1A)
      Assignment is due to:
        - auto-assigned
    Lane 0: 'inst_0/lsc2p5_gbe_top_inst/genblk1.lsc2p5_gbephy_inst/mpphy_03A_inst/lsc2p5_mpphy_inst/mpp_nonpipe_x1.u_nonpipe_x1' (MPPHY1A)
      Assignment is due to:
        - auto-assigned

  ~~ PLL Assignment Within Quad (determined by protocol/data rate) ~~
    MPLLA: -- un-assigned --
    MPLLB: inst_1/lsc2p5_gbe_top_inst/genblk1.lsc2p5_gbephy_inst/mpphy_03A_inst/lsc2p5_mpphy_inst/mpp_nonpipe_x1.u_nonpipe_x1, inst_0/lsc2p5_gbe_top_inst/genblk1.lsc2p5_gbephy_inst/mpphy_03A_inst/lsc2p5_mpphy_inst/mpp_nonpipe_x1.u_nonpipe_x1

Note: a quad that consists of only auto-assigned instances could be moved to a different quad during Place & Route

```

Figure 2.25. Lane Merging Report File

### 2.5.3.4. Restrictions and Limitations

To merge instances into the same quad, instances must abide by the following restrictions:

- Shared reference clock connection.
- Shared LMMI clock and reset connections.
- Compatible PLL settings (this is protocol/data rate dependent, and will be configured by the IP Catalog tool)
- Compatible “per-quad” connections – a limited number of ports exposed on the MPPHY IP physically have only a single instance on the silicon. These must be connected to the same net if it is an input, or have a maximum of one connected per-quad if it is an output.

- All input must be driven by the same source. For output clock, use only the output clock from one instance of the quad to drive the logic. For output clocks from other IP instances that are merged into the same quad, do not use the clock to drive any logic. Refer to the table below.

**Table 2.2. Shared Signal Mapping of 2.5G Ethernet IP to MPPHY for Lane Merging**

MPPHY	2.5G Ethernet IP	Direction
lmmiclk_q0_i	sysbus_clk_i	Input
refclk_p_q0_i refclk_n_q0_i	pad_refclkp_i pad_refclkn_i	Input
lmmireset_n_q0_i	reset_n_i	Input
txoutgclk_pll0_q0_o	phy_tx_gclk_o[0]	Output
txoutgclk_pll1_q0_o	phy_tx_gclk_o[1]	Output

If any of these restrictions are violated, the Radiant software will not automatically merge the MPPHY instances into a single quad. If user constraints or lane assignment forces incompatible MPPHY instances into the same quad, an error message is issued, and the Radiant software flow will not continue past the Post-Synthesis stage.

### 2.5.4. PHY Management Block (Avant Device)

The PHY Management block is accessed through the AXI4-Lite or APB interface. This block is responsible for register access of the PCS registers. The two interfaces (AXI4-Lite, or APB) are available for PCS Module Registers.

For PCS register access through AXI4-Lite, this soft IP requires the use of remapped addresses (0xA000 – 0xA0FC) as AXI4-Lite addresses must be DWORD-aligned (0xA000, 0xA004, 0xA008, 0xA00C, and so on). To get the corresponding AXI4-Lite addresses, you will need to left shift even-numbered PCS address once (or multiply by two) – the lower 2 bytes of the AXI4-Lite read/write data will be mapped to the even-numbered PCS register; while the upper 2 bytes of the AXI4-Lite read/write data will be mapped to the subsequent odd-numbered PCS register.

For details and illustrations on how the AXI4-Lite address remapping works, refer to [Table 2.3](#) and [Figure 2.26](#).

**Note:** The read/write data values used in the following illustrations are just examples and are not the suggested register values to be written. Because PCS registers are half-duplex, simultaneous write to/read from PCS registers through AXI4-Lite channels are not supported.

For APB, no address remapping is required. The actual PCS Module Registers addresses (0x5000 – 0x507F) are used.

**Table 2.3. AXI4-Lite to PCS Address and Data Conversion**

axi4l_awaddr_i[31:0] / axi4l_araddr_i[31:0]	axi4l_wdata_i[31:0] / axi4l_rdata_o[31:0]	PCS Register Address (16-bit)	Access Types	PCS Register Values (16-bit)
0xA000	0x22334455	0x5000	RW	0x4455 = axi4l_wdata_i[15:0]
		0x5001	—	Not available
0xA004	0xaabbccdd	0x5002	RW	0xccdd = axi4l_wdata_i[15:0]
		0x5003	RW	0xaabb = axi4l_wdata_i[31:16]
0xA008	0x11335577	0x5004	RW	0x5577 = axi4l_wdata_i[15:0]
		0x5005	RW	0x1133 = axi4l_wdata_i[31:16]
0xA0FC	0x8899eeff	0x507E	RO	Read-only register
		0x507F	RW	0x8899 = axi4l_wdata_i[31:16]

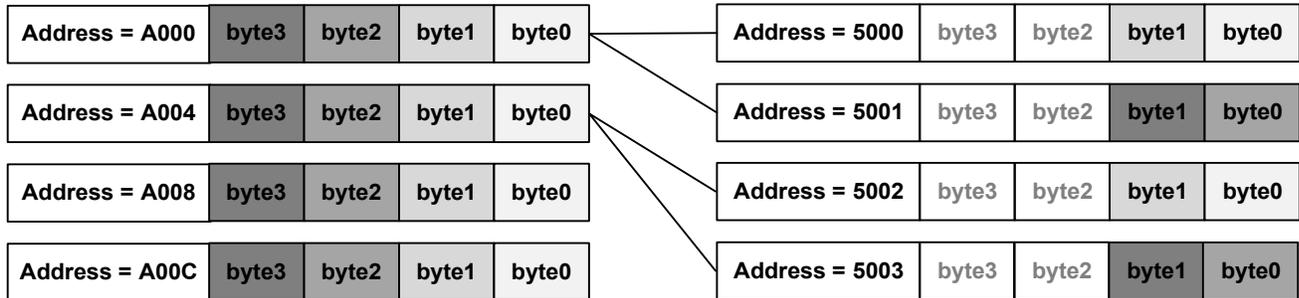

Figure 2.26. Remapped Addresses for PCS Register Address through the AXI4-Lite Interface

## 2.5.5. Loopback Modes

### 2.5.5.1. MPPHY Loopback Description

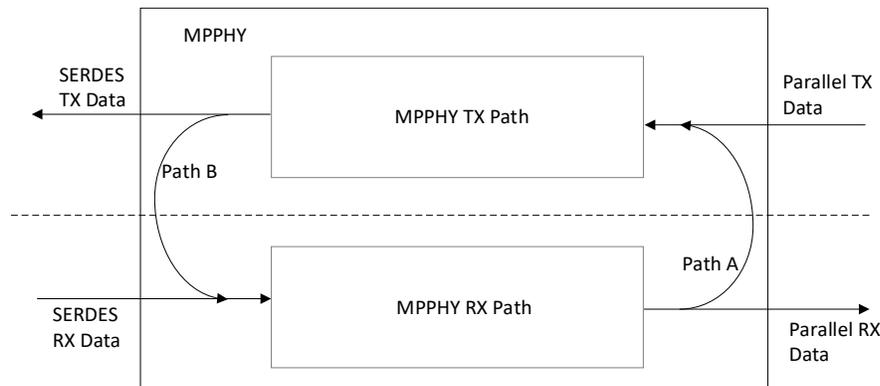

Figure 2.27. 2.5G MPPHY Loopback Diagram

The following lists the MPPHY loopback description:

- Path A – Far End Parallel Loopback. When enabled, MPPHY RX data path loops back to the MPPHY TX data path. It can be used to test and debug the digital data path end-to-end.
- Path B – Near End Parallel Loopback. When enabled, MPPHY TX data path loops back to the MPPHY RX data path.

## 2.6. Clocking

### 2.6.1. Clocking Overview for CertusPro-NX Device

The reference clock frequency for `pad_refclk[p,n]_i` is 156.25 MHz. Once the 2.5G PHY achieved the synchronization, the `xg_rx/tx_clk_o` will output a 156.25 MHz clock frequency and supply them to the MAC core for `IP_OPTION = MAC + PHY, MAC ONLY, and PHY ONLY`. The `sysbus_clk_i` is used as the register clock source.

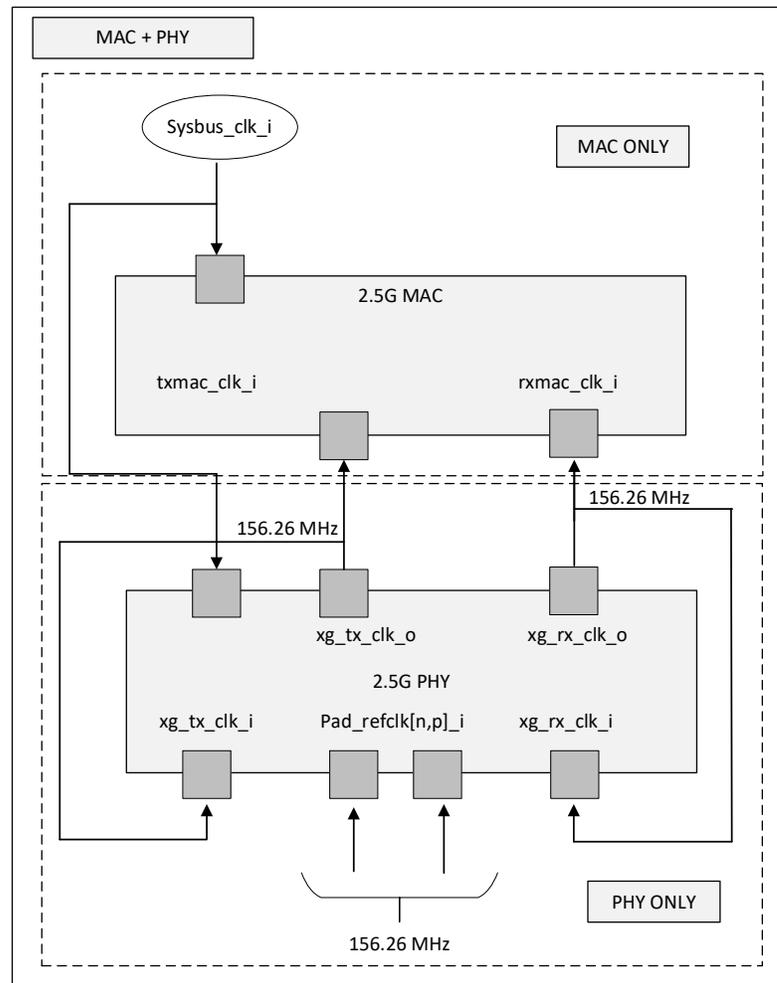

Figure 2.28. 2.5G IP Core Clock Domain Block Diagram for CertusPro-NX Device

### 2.6.2. Clocking Overview for Avant Devices

The reference clock frequency for `pad_refclk[p,n]_i` is 156.25 MHz. Once the 2.5G PHY achieved the synchronization, the `xg_rx/tx_gclk_o` output a 156.25 MHz clock frequency and supply them to the MAC core for `IP_OPTION = MAC+PHY`, `MAC ONLY`, and `PHY ONLY`. The `sysbus_clk_i` is used as the register clock source. In the `MAC + PHY` configuration, you must connect the `txmac_clk_i` and `rxmac_clk_i` output clock from the PHY block.

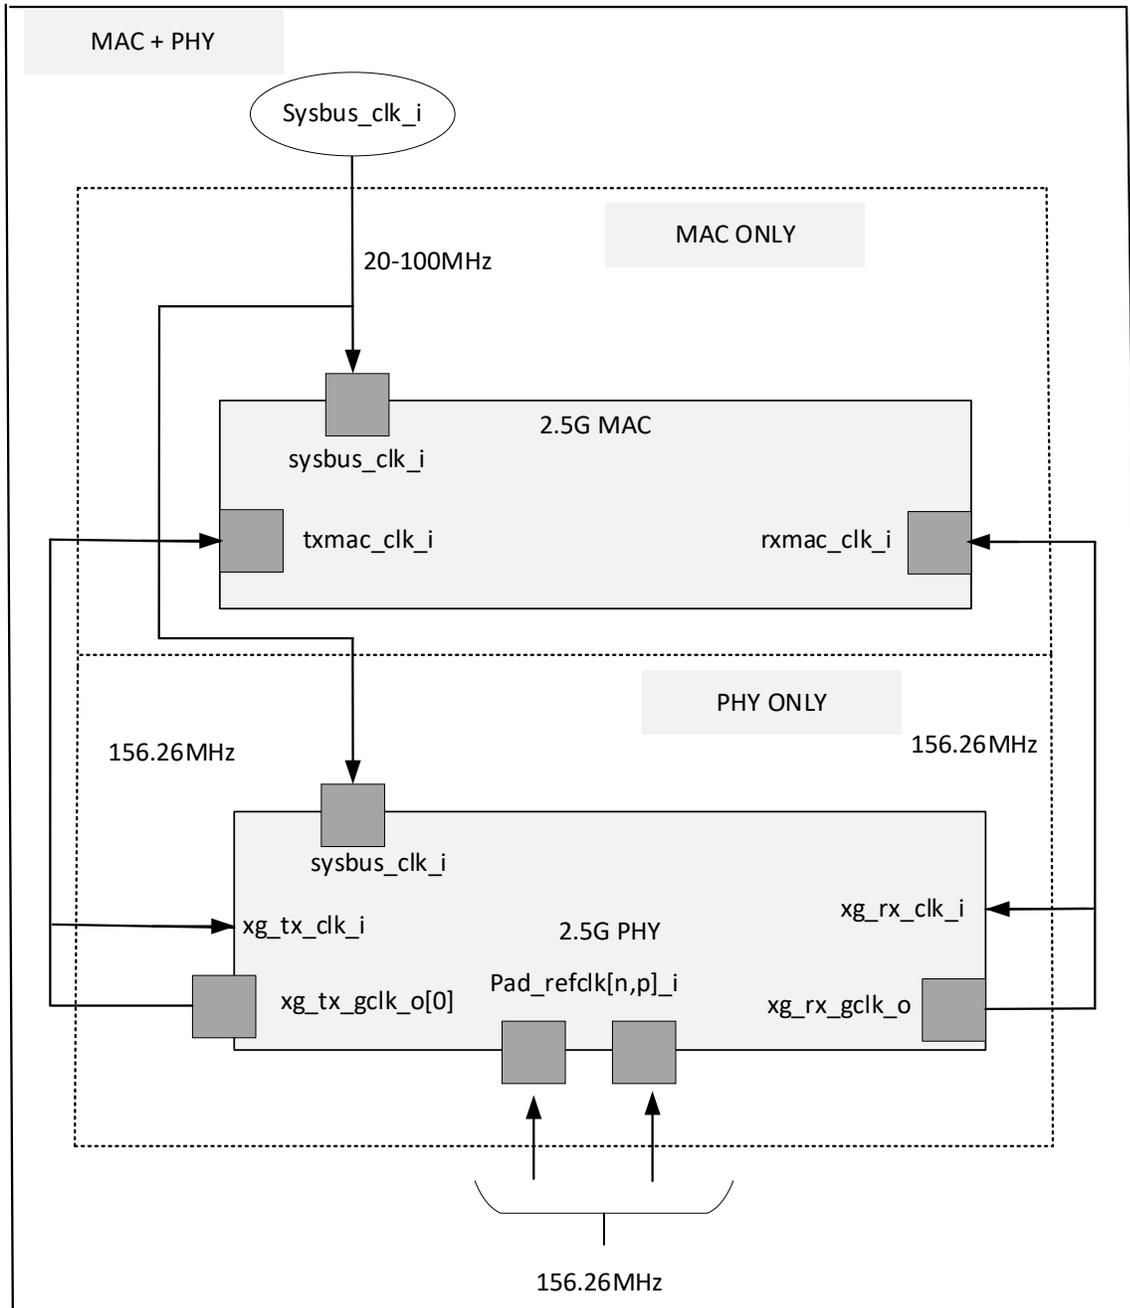

Figure 2.29. 2.5G IP Core Clock Domain Block Diagram for Avant Device

## 2.7. Reset

### 2.7.1. MAC Only Reset Sequence for CertusPro-NX Devices and Avant Devices

#### 2.7.1.1. Reset

An asynchronous reset pin (active low) as system reset is used for resetting the 2.5G Ethernet IP core. Internal reset logic is implemented to guarantee synchronous de-assertion all throughout the different clock domain among soft logic blocks. The minimum assertion of reset is five clock cycles of the slowest clock\*.

### 2.7.1.2. Sequence

The following lists the sequence after power-up of the chip or system:

1. T1: Assert reset pin for five clock cycles of the slowest clock\* of the system.
2. T2: Wait for the 2.5G PHY to be in the ready state.  
For more information on the sequence, see the [PHY \(CertusPro-NX Devices\)](#) section.
3. Send settings through the APB interface to configure the system. For a list of MAC registers, refer to the [Configuration Registers for MAC](#) section.
4. T3: The MAC is ready to receive transfers.

\* **Note:** The slowest clock refers to the `sysbus_clk_i` with frequency that can be as low as 20 MHz.

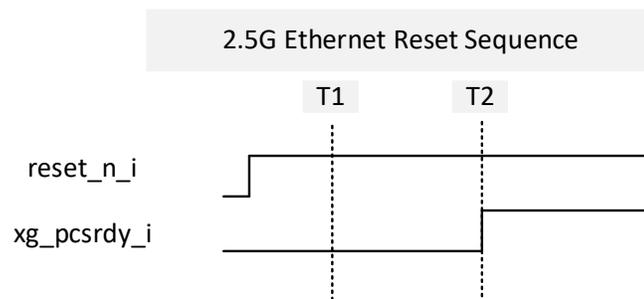

Figure 2.30. Reset Sequence for MAC Only

## 2.7.2. MAC + PHY Reset Sequence for Avant Device

### 2.7.2.1. Reset

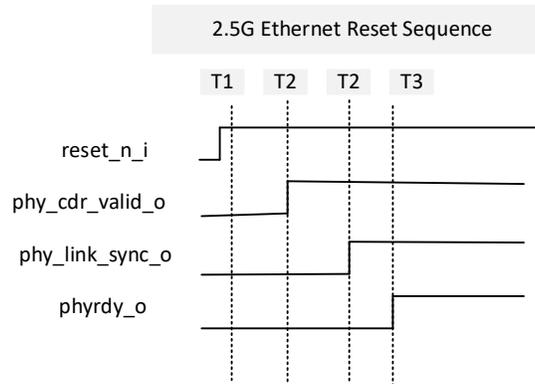

An asynchronous reset pin (active low) as system reset is used for resetting the 2.5GbE PHY IP core. Internal reset logic is implemented to guarantee synchronous deassertion all throughout the different clock domain among soft logic blocks. The minimum assertion of reset is five clock cycles of the slowest clock\*.

### 2.7.2.2. Sequence

The following lists the sequence after power-up of the chip or system:

1. T1: Assert reset pin, `reset_n_i`, for five clock cycles of the slowest clock\* of the system.
2. T2: Wait for the 2.5G PHY (Example: `phy_link_sync_o`, `phyrdy_o`, and `phy_cdr_valid_o`) to be in the ready state.  
If `phy_link_sync_o`, `phyrdy_o` and `phy_cdr_valid_o` signals is asserted, then input reset pin such as `reset_n_i`, `phy_tx_rst_n_i`, and `phy_rx_rst_n_i` must be deasserted.
3. Send settings through the APB or AXI4-Lite interface to configure the system.
4. T3: The IP is ready to transmit and receive packets.

\***Note:** The slowest clock refers to the `sysbus_clk_i` with frequency that can be as low as 20 MHz.

**Figure 2.31. Reset Sequence for MAC + PHY in Avant Devices**

### 2.7.3. MAC + PHY Reset Sequence for (CertusPro-NX Devices)

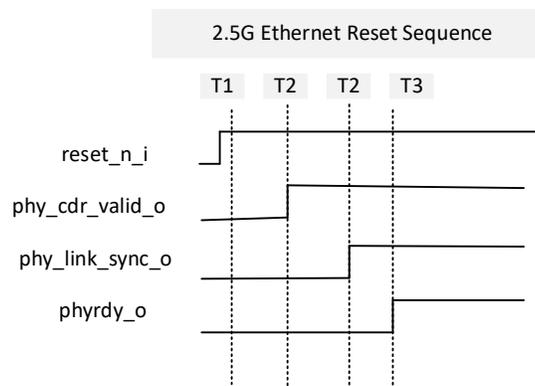

#### 2.7.3.1. Reset

An asynchronous reset pin (active low) as system reset is used for resetting the 2.5G Ethernet PHY IP core. Internal reset logic is implemented to guarantee synchronous de-assertion all throughout the different clock domain among soft logic blocks. The minimum assertion of reset is five clock cycles of the slowest clock\*.

#### 2.7.3.2. Sequence

The following lists the sequence after power-up of the chip or system:

1. T1: Assert reset\_n\_i pin for five clock cycles of the slowest clock\* of the system.
2. T2: Wait for the 2.5G PHY (Example: phy\_link\_sync\_o, phyrdy\_o, and phy\_txrdy\_o) to be in the ready state.  
If phy\_link\_sync\_o, phyrdy\_o and phy\_txrdy\_o signals is deasserted, then input reset pin such as reset\_n\_i, phy\_tx\_rst\_n\_i, and phy\_rx\_rst\_n\_i must be deasserted.
3. Send settings through the APB interface to configure the system.
4. T3: The IP is ready to transmit and receive packets.

**Figure 2.32. Reset Sequence for MAC + PHY in CertusPro-NX Devices**

## 2.7.4. PHY Only Reset Sequence (Avant Devices)

### 2.7.4.1. Reset

An asynchronous reset pin (active low) as system reset is used for resetting the 2.5G Ethernet PHY IP core. Internal reset logic is implemented to guarantee synchronous de-assertion all throughout the different clock domain among soft logic blocks. The minimum assertion of reset is five clock cycles of the slowest clock\*.

### 2.7.4.2. Sequence

The following lists the sequence after power-up of the chip or system:

1. T1: Assert reset\_n\_i pin for five clock cycles of the slowest clock\* of the system.
2. T2: Wait for the 2.5G PHY (Example: phy\_link\_sync\_o, phyrdy\_o) to be in the ready state.  
If phy\_link\_sync\_o and phyrdy\_o signals is asserted, then input reset pin such as reset\_n\_i and xg\_rx\_rst\_n\_i must be deasserted.
3. Send settings through the APB or AXI4-Lite interface to configure the system.
4. T3: The IP is ready to transmit and receive packets.

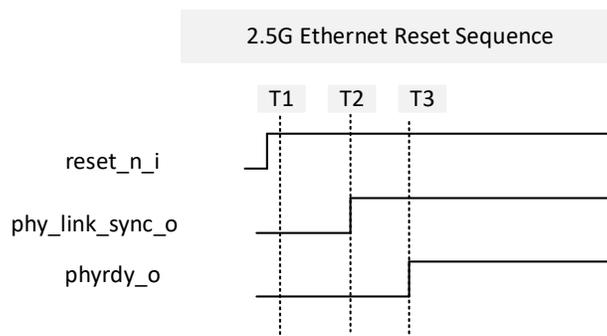

Figure 2.33. Reset Sequence for PHY Only in Avant Devices

## 2.7.5. PHY Reset Sequence (CertusPro-NX Devices)

### 2.7.5.1. Reset

An asynchronous reset pin (active low) as system reset is used for resetting the 2.5G Ethernet PHY IP core. Internal reset logic is implemented to guarantee synchronous de-assertion all throughout the different clock domain among soft logic blocks. The minimum assertion of reset is five clock cycles of the slowest clock\*.

### 2.7.5.2. Sequence

The following lists the sequence after power-up of the chip or system:

1. T1: Assert reset\_n\_i pin for five clock cycles of the slowest clock\* of the system.
2. T2: Wait for the 2.5G PHY (Example: phy\_link\_sync\_o, phyrdy\_o, and phy\_txrdy\_o) to be in the ready state.  
If phy\_link\_sync\_o, phyrdy\_o, and phy\_txrdy\_o signals are deasserted, then input reset pin such as reset\_n\_i must be deasserted.
3. Send settings through the APB interface to configure the system.
4. T3: The IP is ready to transmit and receive packets.

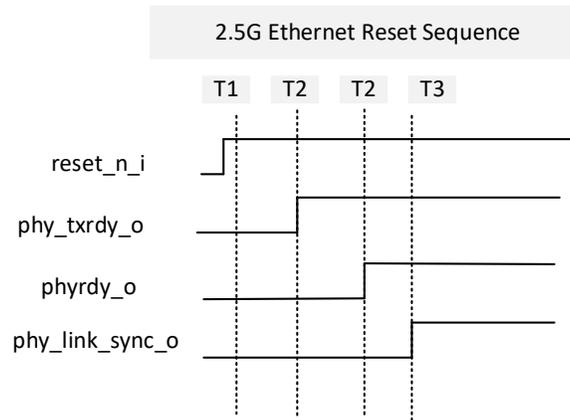

Figure 2.34. Reset Sequence for PHY Only in CertusPro-NX Devices

### 3. IP Parameter Description

The configurable attributes of the 2.5G Ethernet IP core are shown in the following tables. You can configure the IP core by setting the attributes accordingly in the IP Catalog’s Module/IP wizard of the Lattice Radiant software.

#### 3.1. MAC + PHY (CertusPro-NX)

The following table lists the 2.5G Ethernet IP core configurable attributes for the *MAC + PHY* option. The values set for attributes with corresponding registers serve as the maximum values and cannot be set higher during dynamic reconfiguration. Select IP Option—*MAC + PHY* option.

**Table 3.1. MAC + PHY Attributes**

Attribute	Selectable Values	Default	Description	Dependency on Other Attributes
<b>General Configuration</b>				
Select IP Option	<ul style="list-style-type: none"> <li>MAC + PHY</li> <li>PHY Only</li> <li>MAC Only</li> </ul>	MAC + PHY	IP option.	—
Host Interface	<ul style="list-style-type: none"> <li>Not editable</li> </ul>	APB	Set the register interface.	—
Loopback Mode	<ul style="list-style-type: none"> <li>Disabled</li> <li>Near PMA Loopback</li> <li>Fabric Loopback</li> </ul>	Disabled	PCS loopback. For more information, refer to the <a href="#">PCS Loopback</a> section.	—
<b>MAC Configuration</b>				
Multicast Address Filtering	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	Enables or disables address filtering for multicast frames.	Enabled when <i>Select IP Option == MAC Only</i> or <i>MAC + PHY</i>
TX Pause Frame Generation via Ports	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	Enables or disables TX pause frame generation via ports.	Enabled when <i>Select IP Option == MAC Only</i> or <i>MAC + PHY</i>
<b>Statistics Counter Configuration</b>				
Statistic Counter Registers	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	Enables or disables statistics counter registers	Enabled when <i>Select IP Option == MAC Only</i> or <i>MAC + PHY</i>
Counter Width	<ul style="list-style-type: none"> <li>32</li> <li>64</li> </ul>	32	Statistics counters register size.	Enabled when <i>Select IP Option == MAC Only</i> or <i>MAC + PHY</i>
TX Statistics	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	TX statistics.	Enabled when <i>Select IP Option == MAC Only</i> or <i>MAC + PHY</i>
RX Statistics	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	RX statistics.	Enabled when <i>Select IP Option == MAC Only</i> or <i>MAC + PHY</i>
<b>PMA Setup-Receiver Subgroup (default values are recommended)</b>				
RX Adaptive Equalization Enable	<ul style="list-style-type: none"> <li>Not editable</li> </ul>	Enabled	RX adaptive EQ capability	—
<b>RX Adaptive Equalization</b>				
Setting1: Enable	<ul style="list-style-type: none"> <li>Checked</li> <li>Unchecked</li> </ul>	Checked	—	—
Setting1: Adaptive Algorithm	<ul style="list-style-type: none"> <li>SS_LMS</li> </ul>	RL2plus	—	Editable if <i>Setting1:</i>

Attribute	Selectable Values	Default	Description	Dependency on Other Attributes
	<ul style="list-style-type: none"> <li>RL2plus</li> </ul>			<i>Enable</i> == Checked
Setting2: Enable	<ul style="list-style-type: none"> <li>Checked</li> <li>Unchecked</li> </ul>	Unchecked	—	—

<b>RX Adaptive Equalization</b>				
Setting1: Enable	<ul style="list-style-type: none"> <li>Checked</li> <li>Unchecked</li> </ul>	Checked	—	—
Setting1: Adaptive Algorithm	<ul style="list-style-type: none"> <li>SS_LMS</li> <li>RL2plus</li> </ul>	RL2plus	—	Editable if <i>Setting1: Enable</i> == Checked
Setting2: Enable	<ul style="list-style-type: none"> <li>Checked</li> <li>Unchecked</li> </ul>	Unchecked	—	—
Setting2: Adaptive Algorithm	<ul style="list-style-type: none"> <li>SS_LMS</li> <li>RL2plus</li> </ul>	RL2plus	—	Editable if <i>Setting2: Enable</i> == Checked
Setting3: Enable	<ul style="list-style-type: none"> <li>Checked</li> <li>Unchecked</li> </ul>	Unchecked	—	—
Setting3: Adaptive Algorithm	<ul style="list-style-type: none"> <li>SS_LMS</li> <li>RL2plus</li> </ul>	RL2plus	—	Editable if <i>Setting3: Enable</i> == Checked
Setting1/2: Preliminary Adaptive EQ	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Enabled	—	Editable if <i>Setting1/2: Enable</i> == Checked
Setting1/2: Training Phase Adaptive EQ	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Enabled	—	Editable if <i>Setting1/2: Enable</i> == Checked
Setting1/2: Post-Phase Adaptive EQ	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Enabled	—	Editable if <i>Setting1/2: Enable</i> == Checked
Setting3: Preliminary Adaptive EQ	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Enabled	—	Editable if <i>Setting3: Enable</i> == "Checked"
Setting3: Training Phase Adaptive EQ	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Enabled	—	Editable if <i>Setting3: Enable</i> == Checked
Setting3: Post-Phase Adaptive EQ	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Enabled	—	Editable if <i>Setting3: Enable</i> == Checked
<b>PHY Configuration</b>				
PCS Lane ID	For CertusPro-NX <sup>1</sup> devices: <ul style="list-style-type: none"> <li>AUTO</li> <li>0</li> <li>1</li> <li>2</li> <li>3</li> <li>4</li> <li>5</li> <li>6</li> <li>7</li> </ul>	AUTO	Specifies the Lane ID	Enabled when <i>Select IP Option</i> == <i>PHY Only</i> or <i>MAC + PHY</i>

**Note:**

- CertusPro-NX devices supported lanes:
  - LFCPNX-100 supported lanes: Lane 0, Lane 1, Lane 2, Lane 3, Lane 4, Lane 5, Lane 6, and Lane 7.

- LFCPNX-50 supported lanes: Lane 0, Lane 1, Lane 2, and Lane 3 only.

### 3.3. MAC Only

The following table lists the 2.5G Ethernet IP core configurable attributes for the *MAC Only* option. The values set for attributes with corresponding registers serve as the maximum values and cannot set higher than these values during dynamic reconfiguration. Select IP Option—*MAC Only* option.

**Table 3.3. MAC Only Attributes**

Attribute	Selectable Values	Default	Description	Dependency on Other Attributes
<b>General Configuration</b>				
Select IP Option	<ul style="list-style-type: none"> <li>• MAC + PHY</li> <li>• PHY Only</li> <li>• MAC Only</li> </ul>	MAC Only	IP option.	—
Host Interface	<ul style="list-style-type: none"> <li>• Not editable</li> </ul>	APB	Set the register interface.	—
<b>MAC Configuration</b>				
Multicast Address Filtering	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Enables or disables address filtering for Multicast frames.	Enabled when <i>Select IP Option == MAC Only</i> or <i>MAC + PHY</i>
TX Pause Frame Generation via Ports	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Enables or disables TX pause frame generation via ports.	Enabled when <i>Select IP Option == MAC Only</i> or <i>MAC + PHY</i>
<b>Statistics Counter Configuration</b>				
Statistics Counter Registers	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	Enables or disables statistics counter registers.	Enabled when <i>Select IP Option == MAC Only</i> or <i>MAC + PHY</i>
Counter Width	<ul style="list-style-type: none"> <li>• 32</li> <li>• 64</li> </ul>	32	Statistics counters register size.	Enabled when <i>Select IP Option == MAC Only</i> or <i>MAC + PHY</i>
TX Statistics	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	TX statistics.	Enabled when <i>Select IP Option == MAC Only</i> or <i>MAC + PHY</i>
RX Statistics	<ul style="list-style-type: none"> <li>• Enabled</li> <li>• Disabled</li> </ul>	Disabled	RX statistics.	Enabled when <i>Select IP Option == MAC Only</i> or <i>MAC + PHY</i>

### 3.4. MAC + PHY (Avant Devices)

The following table lists the 2.5G Ethernet IP core configurable attributes for the *MAC + PHY* option. The values set for attributes with corresponding registers serve as the maximum values and cannot be set higher during dynamic reconfiguration. Select IP Option—*MAC + PHY* option.

**Table 3.4. MAC + PHY Attributes (Avant Devices)**

Attribute	Selectable Values	Default	Description	Dependency on Other Attributes
<b>General Configuration</b>				
Select IP Option	<ul style="list-style-type: none"> <li>• MAC + PHY</li> <li>• PHY Only</li> <li>• MAC Only</li> </ul>	MAC + PHY	IP option.	—
Host Interface	<ul style="list-style-type: none"> <li>• AXI4-Lite</li> <li>• APB</li> </ul>	AXI4-Lite	Set the register interface.	—
<b>MAC Configuration</b>				

Attribute	Selectable Values	Default	Description	Dependency on Other Attributes
Multicast Address Filtering	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	Enables or disables address filtering for multicast frames.	Enabled when <i>Select IP Option == MAC Only</i> or <i>MAC + PHY</i>
TX Pause Frame Generation via Ports	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	Enables or disables TX pause frame generation via ports.	Enabled when <i>Select IP Option == MAC Only</i> or <i>MAC + PHY</i>
<b>Statistics Counter Configuration</b>				
Statistic Counter Registers	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	Enables or disables statistics counter registers	Enabled when <i>Select IP Option == MAC Only</i> or <i>MAC + PHY</i>
Counter Width	<ul style="list-style-type: none"> <li>32</li> <li>64</li> </ul>	32	Statistics counters register size.	Enabled when <i>Select IP Option == MAC Only</i> or <i>MAC + PHY</i>
TX Statistics	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	TX statistics.	Enabled when <i>Select IP Option == MAC Only</i> or <i>MAC + PHY</i>
RX Statistics	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	RX statistics.	Enabled when <i>Select IP Option == MAC Only</i> or <i>MAC + PHY</i>
<b>PMA Setup-Receiver Subgroup (default values are recommended)</b>				
RX Coupling Mode	<ul style="list-style-type: none"> <li>AC Coupling</li> <li>DC Coupling</li> </ul>	AC Coupling	PMA Coupling mode	Enabled when <i>Select IP Option == PHY Only</i> or <i>MAC + PHY</i>
RX Loss of Sig port Enable	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Enabled	RX Loss of Sig capability.	Enabled when <i>Select IP Option == PHY Only</i> or <i>MAC + PHY</i>
RX Adaptive Equalization Enable	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Enabled	RX adaptive EQ capability.	Enabled when <i>Select IP Option == PHY Only</i> or <i>MAC + PHY</i> Selectable only when <i>DFE Enable == Disabled</i>
DFE Enable	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Enabled	DFE capability.	Enabled when <i>Select IP Option == PHY Only</i> or <i>MAC + PHY</i>
DFE Tap Configuration	<ul style="list-style-type: none"> <li>All Taps</li> <li>1 Tap</li> </ul>	All Taps	DFE Tap settings.	Enabled when <i>Select IP Option == PHY Only</i> or <i>MAC + PHY</i> Selectable only when <i>DFE Enable == Enabled</i>
RX Attenuation Block	<ul style="list-style-type: none"> <li>-13dB</li> <li>-2dB</li> </ul>	-13dB	RX Attenuation setting. Higher dB loss reflects higher capability of the RX to handle a lossy signal.	Enabled when <i>Select IP Option == PHY Only</i> or <i>MAC + PHY</i> Selectable only when <i>RX Adaptive Equalization Enable == Disabled</i>
<b>RX Adaptive Equalization</b>				
Setting1: Enable	<ul style="list-style-type: none"> <li>Checked</li> <li>Unchecked</li> </ul>	Checked	—	—
Setting1: Adaptive Algorithm	<ul style="list-style-type: none"> <li>SS_LMS</li> </ul>	RL2plus	—	Editable if <i>Setting1:</i>

Attribute	Selectable Values	Default	Description	Dependency on Other Attributes
	<ul style="list-style-type: none"> <li>RL2plus</li> </ul>			<i>Enable</i> == Checked
Setting2: Enable	<ul style="list-style-type: none"> <li>Checked</li> <li>Unchecked</li> </ul>	Unchecked	—	—
Setting2: Adaptive Algorithm	<ul style="list-style-type: none"> <li>SS_LMS</li> <li>RL2plus</li> </ul>	RL2plus	—	Editable if <i>Setting2: Enable</i> == Checked
Setting3: Enable	<ul style="list-style-type: none"> <li>Checked</li> <li>Unchecked</li> </ul>	Unchecked	—	—
Setting3: Adaptive Algorithm	<ul style="list-style-type: none"> <li>SS_LMS</li> <li>RL2plus</li> </ul>	RL2plus	—	Editable if <i>Setting3: Enable</i> == Checked

Setting1/2: Post-Phase Adaptive EQ	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Enabled	—	Editable if <i>Setting1/2: Enable == Checked</i>
Setting3: Preliminary	<ul style="list-style-type: none"> <li>Enabled</li> </ul>	Enabled	—	Editable if <i>Setting3:</i>

Attribute	Selectable Values	Default	Description	Dependency on Other Attributes
Adaptive EQ	<ul style="list-style-type: none"> <li>Disabled</li> </ul>			<i>Enable == "Checked"</i>
Setting3: Training Phase Adaptive EQ	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Enabled	—	Editable if <i>Setting3: Enable == Checked</i>
Setting3: Post-Phase Adaptive EQ	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Enabled	—	Editable if <i>Setting3: Enable == Checked</i>
<b>PHY Configuration</b>				
Fast Simulation Mode	<ul style="list-style-type: none"> <li>Enabled</li> <li>Disabled</li> </ul>	Disabled	Enables or disables the fast sim mode	Enabled when <i>Select IP Option == PHY Only or MAC + PHY</i>
PCS Lane ID	<ul style="list-style-type: none"> <li>AUTO</li> <li>0-27</li> </ul>	AUTO	Specifies the Lane ID.	Enabled when <i>Select IP Option == PHY Only or MAC + PHY</i>
Loopback Mode	<ul style="list-style-type: none"> <li>Far End Parallel Loopback</li> <li>Near End Parallel Loopback</li> <li>No Loopback</li> </ul>	No Loopback	Enables the Far End Parallel Loopback or Near End Parallel Loopback or No Loopback.	Enabled when <i>Select IP Option == PHY Only or MAC + PHY</i>

**Note:**

- Avant devices supported lanes:
  - G/X30 supported lanes: Lane 0 -11.
  - G/X50 supported lanes: Lane 0-15.
  - G/X50 supported lanes: Lane 0-27.

## 4. Signal Description

### 4.1. MAC + PHY Signals (CertusPro-NX Devices)

Table 4.1. Signal Description—MAC + PHY

Port Name	Clock Domain	I/O	Width	Description
<b>Clock and Reset</b>				
reset_n_i	Asynchronous	In	1	Active-low asynchronous reset.
phy_tx_clk_o	—	Out	1	TX clock output from PHY (156.25 MHz).
phy_rx_clk_o	—	Out	1	RX clock output from PHY (156.25 MHz).
sysbus_clk_i	—	In	1	Clock for the Management module (APB interface). It is recommended to use between 20 MHz to 156.25 MHz clock for GMII interface.
<b>Other Reference Clock Source</b>				
refclkp0_ext_i	—	In	1	156.25 MHz reference clock from external I/O pad0 (+).
refclkn0_ext_i	—	In	1	156.25 MHz reference clock from external I/O pad0 (+).
refclkp1_ext_i	—	In	1	156.25 MHz reference clock from external I/O pad1 (+).
refclkn1_ext_i	—	In	1	156.25 MHz reference clock from external I/O pad1 (+).
pll_0_refclk_i	—	In	1	156.25 MHz generated reference clock from the Left PLL.
pll_1_refclk_i	—	In	1	156.25 MHz generated reference clock from the Left PLL.
sd_pll_refclk_i	—	In	1	156.25 MHz reference clock from fabric.
<b>Reference Clock MUX Tree Control Signals</b>				
use_refmux_i	—	In	1	Refer to the <a href="#">Reference Clocks</a> section.
diffioclkssel_i	—	In	1	Refer to the <a href="#">Reference Clocks</a> section.
clkssel_i	—	In	2	Refer to the <a href="#">Reference Clocks</a> section.
<b>Clock and Reset</b>				
phy_pcs_clkln_i	—	In	1	This clock also drives the PMA epcs_clkln_i clock port with 156.25 MHz.
<b>Serial I/O</b>				
pad_refclkn_i	—	In	1	156.25 MHz SERDES PLL reference clock signal (-).
pad_refclkp_i	—	In	1	156.25 MHz SERDES PLL reference clock signal (+).
pad_rxn_i	—	In	1	RX- differential signal.
pad_rxp_i	—	In	1	RX+ differential signal.
pad_txn_o	—	Out	1	TX- differential signal.
pad_txp_o	—	Out	1	TX+ differential signal.
<b>Client-Side Interface</b>				
<b>AXI4-Stream Receive Interface</b>				
axis_rx_tdata_o	phy_rx_clk_o	Out	64	AXI4-Stream data from PHY to the client.
axis_rx_tkeep_o	phy_rx_clk_o	Out	8	AXI4-Stream control that indicates which data is valid on axis_rx_tdata_o [ ]. <ul style="list-style-type: none"> <li>axis_rx_tkeep_o[0]: axis_rx_tdata_o [7:0]</li> <li>axis_rx_tkeep_o[1]: axis_rx_tdata_o [15:8]</li> <li>axis_rx_tkeep_o[2]: axis_rx_tdata_o [23:16]</li> <li>axis_rx_tkeep_o[3]: axis_rx_tdata_o [31:24]</li> <li>axis_rx_tkeep_o[4]: axis_rx_tdata_o [39:32]</li> <li>axis_rx_tkeep_o[5]: axis_rx_tdata_o [47:40]</li> <li>axis_rx_tkeep_o[6]: axis_rx_tdata_o [55:48]</li> <li>axis_rx_tkeep_o[7]: axis_rx_tdata_o [63:56]</li> </ul>
axis_rx_tvalid_o	phy_rx_clk_o	Out	1	AXI4-Stream data valid.
axis_rx_tuser_o	phy_rx_clk_o	Out	1	AXI4-Stream user signal used to indicate that the frame had a length error,

Port Name	Clock Domain	I/O	Width	Description
				termination error, or a cyclic redundancy check (CRC) error. This signal is qualified with the axis_rx_tlast_o signal.
axis_rx_tlast_o	phy_rx_clk_o	Out	1	AXI4-Stream signal indicating the end of a packet.
<b>AXI4-Stream Transmit Interface</b>				
axis_tx_tready_o	phy_tx_clk_o	Out	1	AXI4-Stream signal indicating that the core can accept data transfer.
axis_tx_tdata_i	phy_tx_clk_o	In	64	AXI4-Stream data from the client.
axis_tx_tkeep_i	phy_tx_clk_o	In	8	AXI4-Stream control that indicates which data is valid on axis_tx_tdata_i [ ]. <ul style="list-style-type: none"> <li>axis_tx_tkeep_i[0]: axis_tx_tdata_i[7:0]</li> <li>axis_tx_tkeep_i[1]: axis_tx_tdata_i[15:8]</li> <li>axis_tx_tkeep_i[2]: axis_tx_tdata_i[23:16]</li> <li>axis_tx_tkeep_i[3]: axis_tx_tdata_i[31:24]</li> <li>axis_tx_tkeep_i[4]: axis_tx_tdata_i[39:32]</li> <li>axis_tx_tkeep_i[5]: axis_tx_tdata_i[47:40]</li> <li>axis_tx_tkeep_i[6]: axis_tx_tdata_i[55:48]</li> <li>axis_tx_tkeep_i[7]: axis_tx_tdata_i[63:56]</li> </ul>
axis_tx_tvalid_i	phy_tx_clk_o	In	1	AXI4-Stream data valid.
axis_tx_tuser_i	phy_tx_clk_o	In	1	AXI4-Stream user signal to indicate an error in the frame. This signal is qualified with the axis_tx_tlast_i signal.
axis_tx_tlast_i	phy_tx_clk_o	In	1	AXI4-Stream signal indicating the end of a packet.
<b>Auto-Negotiation</b>				
mr_adv_ability	phy_tx_clk_o	In	16	Advertised Ability—Configuration status transmitted by PCS during auto-negotiation process.
mr_an_enable	phy_tx_clk_o	In	1	Auto-Negotiation Enable - Active-high signal that enables auto-negotiation state machine to function.
mr_main_reset	phy_tx_clk_o	In	1	Main Reset—Active-high signal that forces all PCS state machines to reset.
mr_restart_an	phy_tx_clk_o	In	1	Auto-Negotiation Restart—Active-high signal that forces auto-negotiation process to restart.
mr_an_complete	phy_tx_clk_o	Out	1	Auto-Negotiation Complete—Active-high signal that indicates that the auto-negotiation process is completed.
mr_lp_adv_ability	phy_tx_clk_o	Out	16	Link Partner Advertised Ability—Configuration status received from partner PCS entity during the auto-negotiation process. The bit definitions are the same as described above for the mr_adv_ability port
mr_page_rx	phy_tx_clk_o	Out	1	Auto-Negotiation Page Received—Active-high signal that asserts while the auto-negotiation state machine is in the <i>Complete_Acknowledge</i> state.
xmit_autoneg	phy_tx_clk_o	Out	1	Auto-negotiation XMIT Status —This signal should be tied to the “xmit_chn” pin of the SERDES. When the signal is high, it forces the Rx data path of the SERDES to periodically insert idle-code groups into the SERDES Rx data stream. This ensures that the SERDES CTC has opportunities to rate-adapt for ppm offsets. The 2.5G Ethernet PCS IP core drives this signal high when the auto-negotiation process is running. At all other times, the IP core drives this signal low.
an_link_ok	phy_tx_clk_o	Out	1	Auto-Negotiation Link Status OK—Active-high signal that indicates that the link is OK. The signal is driven by the auto-negotiation state machine. When auto-negotiation is enabled, the signal asserts when the state machine is in the LINK_OK state. If auto-negotiation is disabled, the signal asserts when the state machine is in the AN_DISABLE_LINK_OK state. See IEEE 802.3 figure 37-6.
<b>Non-Standard RX/TX Signals</b>				
debug_link_timer_short	phy_tx_clk_i	In	1	Debug Link Timer Mode—Active-high signal that forces the auto-negotiation link timer to run much faster than normal. This mode is provided for debug purposes. For example, allowing simulations to run through the auto-negotiation process much faster than normal.

Port Name	Clock Domain	I/O	Width	Description
phy_rxval_o	phy_rx_clk_o	Out	1	This signal is used to signal receiving valid data.
phy_txrdy_o	phy_pcs_clk_in_i	Out	1	PHY ready: This signal is asserted when the PHY has completed the calibration sequence for each specific lane. This signal is driven by phy_pcs_clk_in_i.
phyrdy_o	phy_tx_clk_o	Out	1	When asserted, this signal tells you that the PHY is ready to transmit.
phy_link_sync_o	phy_rx_clk_o	Out	1	Link Synchronization output port. 1'b1 – link synchronization is acquired. 1'b0 – loss of link synchronization.
phy_rxidle_o	phy_rx_clk_o	Out	1	This port is used to signal the Electrical Idle condition detected by the PMA control logic.
<b>APB Interface<sup>1</sup></b>				
apb_psel_i	sysbus_clk_i	In	1	Select signal. Indicates that the completer device is selected, and a data transfer is required.
apb_paddr_i	sysbus_clk_i	In	32	Address signal.
apb_pwdata_i	sysbus_clk_i	In	32	Write data signal.
apb_pwrite_i	sysbus_clk_i	In	1	Direction signal. Write = 1, Read = 0.
apb_penable_i	sysbus_clk_i	In	1	Enable signal. Indicates the second and subsequent cycles of an APB transfer.
apb_pready_o	sysbus_clk_i	Out	1	Ready signal. Indicates transfer completion. The completer uses this signal to extend an APB transfer.
apb_prdata_o	sysbus_clk_i	Out	32	Read data signal.
apb_pslverr_o	sysbus_clk_i	Out	1	Transfer success or failure signal. Tie to low.
<b>Statistics Vector Interface</b>				
tx_statvec_o	phy_tx_clk_o	Out	28	Contains information on the frame transmitted. This bus is qualified by the tx_staten_o signal. <ul style="list-style-type: none"> <li>tx_statvec_o[13:0]: Frame byte count.</li> <li>tx_statvec_o[14]: Transmit is OK.</li> <li>tx_statvec_o[15]: MAC control inserted by MAC.</li> <li>tx_statvec_o[16]: MAC control inserted by client.</li> <li>tx_statvec_o[17]: Jumbo frame.</li> <li>tx_statvec_o[18]: Tagged frame.</li> <li>tx_statvec_o[19]: Broadcast address.</li> <li>tx_statvec_o[20]: Multicast address.</li> <li>tx_statvec_o[21]: Underrun error.</li> <li>tx_statvec_o[22]: CRC error.</li> <li>tx_statvec_o[23]: Length check error.</li> <li>tx_statvec_o[24]: Terminate error.</li> <li>tx_statvec_o[25]: Long frame error.</li> <li>tx_statvec_o[26]: PTP1588 frame.</li> <li>tx_statvec_o[27]: Reserved for future use.</li> </ul>
tx_staten_o	phy_tx_clk_o	Out	1	When asserted, it indicates that the contents of the tx_statvec_o bus are valid. This signal is asserted for three phy_tx_clk_o periods.
rx_statvec_o	phy_rx_clk_o	Out	28	Contains information on the frame received. This bus is qualified by the rx_staten_o signal. <ul style="list-style-type: none"> <li>rx_statvec_o[13:0]: Frame byte count.</li> <li>rx_statvec_o[14]: Frame dropped.</li> <li>rx_statvec_o[15]: Broadcast frame received.</li> <li>rx_statvec_o[16]: Multicast frame received.</li> <li>rx_statvec_o[17]: CRC error.</li> <li>rx_statvec_o[18]: VLAN tag detected.</li> <li>rx_statvec_o[19]: Pause frame.</li> </ul>

Port Name	Clock Domain	I/O	Width	Description
				<ul style="list-style-type: none"> <li>rx_statvec_o[20]: Length check error.</li> <li>rx_statvec_o[21]: Frame is too long.</li> <li>rx_statvec_o[22]: MAC address mismatch.</li> <li>rx_statvec_o[23]: Unsupported opcode. Only the opcode for pause frame is supported.</li> <li>rx_statvec_o[24]: Minimum IPG violated.</li> <li>rx_statvec_o[25]: Receive packet ignored.</li> <li>rx_statvec_o[26]: PTP1588 frame received.</li> <li>rx_statvec_o[27]: Reserved for future use.</li> </ul>
rx_staten_o	phy_rx_clk_o	Out	1	When asserted, indicates that the contents of the rx_statvec_o bus are valid. This signal is asserted for three phy_rx_clk_o periods.
<b>TX Pause Frame<sup>2</sup></b>				
tx_pausreq_i	phy_tx_clk_o	In	1	Transmit pause frame. 1 = send request, 0 = do not send request. This is a positive edge-triggered bit. The tx_fc_en bit of TX_CTL register should be set to 1 to enable this feature. When this port is enabled, the tx_pausreq bit of MAC_CTL register is not accessible. Subsequent pause request will not be serviced if the pause frame of the first request is not transmitted yet.
tx_paustm_i	phy_tx_clk_o	In	16	Pause Quanta time. This is equivalent to the tx_paustim bit of PAUSE_TM register.

**Notes:**

1. Only APB interface is supported for IP\_OPTION = MAC + PHY.
2. Available when TX Pause Frame Generation via Ports is enabled.

## 4.2. PHY Only Signals (CertusPro-NX Devices)

**Table 4.2. Signal Description—PHY Only (CertusPro-NX Devices)**

Port Name	Clock Domain	I/O	Width	Description
<b>Serial I/O</b>				
pad_refclkn_i	—	In	1	156.25 MHz SERDES PLL reference clock signal (-).
pad_refclkp_i	—	In	1	156.25 MHz SERDES PLL reference clock signal (+).
pad_rxn_i	pad_refclkn_i	In	1	RX- differential signal.
pad_rxp_i	pad_refclkp_i	In	1	RX+ differential signal.
pad_txn_o	pad_refclkn_i	Out	1	TX- differential signal.
pad_txp_o	pad_refclkp_i	Out	1	TX+ differential signal.
<b>Other Reference Clock Source</b>				
refclkn0_ext_i	refclkn0_ext_i	In	1	156.25 MHz reference clock from external I/O pad0 (-).
refclkp0_ext_i	refclkp0_ext_i	In	1	156.25 MHz reference clock from external I/O pad0 (+).
refclkn1_ext_i	refclkn1_ext_i	In	1	156.25 MHz reference clock from external I/O pad1 (-).
refclkp1_ext_i	refclkp1_ext_i	In	1	156.25 MHz reference clock from external I/O pad1 (+).
pll_0_refclk_i	pll_0_refclk_i	In	1	156.25 MHz reference clock from Left PLL.
pll_1_refclk_i	pll_1_refclk_i	In	1	156.25 MHz reference clock from Right PLL.
sd_pll_refclk_i	sd_pll_refclk_i	In	1	156.25 MHz reference clock from fabric.
<b>Reference Clock MUX Tree Control Signals</b>				
use_refmux_i	—	In	1	Refer to the <a href="#">Reference Clocks</a> section.
diffiocksel_i	—	In	1	Refer to the <a href="#">Reference Clocks</a> section.
cksel_i	—	In	2	Refer to the <a href="#">Reference Clocks</a> section.

Port Name	Clock Domain	I/O	Width	Description
<b>Clock and Reset</b>				
phy_tx_clk_i	—	In	1	TX clock input – 156.25 MHz clock for transmit datapath.
phy_tx_rst_n_i	Asynchronous	In	1	TX active low reset. Asynchronous assert, synchronous (phy_tx_clk_i) deassert.
phy_rx_clk_i	—	In	1	RX clock input – 156.25 MHz clock for receive datapath.
phy_rx_rst_n_i	Asynchronous	In	1	RX active low reset. Asynchronous assert, synchronous (phy_rx_clk_i) deassert.
phy_pcs_clkin_i	—	In	1	Clock input to PMA with 156.25 MHz.
phy_tx_clk_o	—	Out	1	TX clock output – 156.25 MHz.
phy_rx_clk_o	—	Out	1	RX clock output – 156.25 MHz.
sysbus_clk_i	—	In	1	Clock for the Management module (APB interface). It is recommended to use between 20 MHz to 156.25 MHz clock for GMII interface.
<b>16-bit GMII</b>				
gmii_16_tx_en_i	phy_tx_clk_i	In	2	2-bit active-high signal that asserts when incoming GMII data is valid. bit[0] is the valid signal for gmii_16_tx_d_i [7:0] bit[1] is the valid signal for gmii_16_tx_d_i [15:8] gmii_16_tx_en_i [1] is associated with the upper byte of the GMII data (bits 15:8). gmii_16_tx_en_i [0] is associated with the lower byte of the GMII data (bits 7:0). Note that when an Ethernet frame is being transmitted, most of the time both transmit enable bits are asserted simultaneously. However, at the beginning and end of the frame, it is possible for only one of the two GMII data bytes to be valid. A GMII data frame can begin and end on any byte (upper or lower).
gmii_16_tx_d_i	phy_tx_clk_i	In	16	16-bit TX data signal.
gmii_16_tx_err_i	phy_tx_clk_i	In	2	Transmit Error—2-bit, active-high signal that denotes transmission errors or carrier extension events on the GMII Tx data port. gmii_16_tx_err_i [1] is associated with the upper byte of the GMII data. gmii_16_tx_err_i [0] is associated with the lower byte of the GMII data.
gmii_16_rx_dv_o	phy_rx_clk_i	Out	2	Receive Data Valid—2-bit, active-high signal that asserts when outgoing GMII data is valid. gmii_16_rx_dv_o [1] is associated with the upper byte of the GMII data (bits 15:8). gmii_16_rx_dv_o [0] is associated with the lower byte of the GMII data (bits 7:0). Note that when an Ethernet frame is being received, most of the time both receive valid bits are asserted simultaneously. However, at the beginning and end of the frame, it is possible for only one of the two GMII data bytes to be valid. A GMII data frame can begin and end on any byte (upper or lower).
gmii_16_rx_d_o	phy_rx_clk_i	Out	16	16-bit RX data signal.
gmii_16_rx_err_o	phy_rx_clk_i	Out	2	Receive Error—2-bit, active-high signal that denotes transmission errors or carrier extension events on the GMII Rx data port. gmii_16_rx_err_o [1] is associated with the upper byte of the GMII data. gmii_16_rx_err_o [0] is associated with the lower byte of the GMII data.

Port Name	Clock Domain	I/O	Width	Description
<b>Auto-Negotiation</b>				
mr_adv_ability	phy_tx_clk_i	In	16	Advertised Ability—Configuration status transmitted by PCS during auto-negotiation process.
mr_an_enable	phy_tx_clk_i	In	1	Auto-Negotiation Enable—Active-high signal that enables auto-negotiation state machine to function.
mr_main_reset	phy_tx_clk_i	In	1	Main Reset—Active-high signal that forces all PCS state machines to reset.
mr_restart_an	phy_tx_clk_i	In	1	Auto-Negotiation Restart—Active-high signal that forces auto-negotiation process to restart.
mr_an_complete	phy_tx_clk_i	Out	1	Auto-Negotiation Complete—Active-high signal that indicates that the auto-negotiation process is completed.
mr_lp_adv_ability	phy_tx_clk_i	Out	16	Link Partner Advertised Ability Configuration status received from partner PCS entity during the auto-negotiation process. The bit definitions are the same as described above for the mr_adv_ability port.
mr_page_rx	phy_tx_clk_i	Out	1	Auto-Negotiation Page Received—Active-high signal that asserts while the auto-negotiation state machine is in the <i>Complete_Acknowledge</i> state.
xmit_autoneg	phy_tx_clk_i	Out	1	Auto-negotiation XMIT Status – This signal should be tied to the “xmit_chn” pin of the SerDes. When the signal is high, it forces the Rx data path of the SerDes to periodically insert idle-code groups into the SerDes RX data stream. This ensures that SerDes CTC has opportunities to rate-adapt for ppm offsets. The 2.5G Ethernet PCS IP core drives this signal high when the auto-negotiation process is running. At all other times, the IP core drives this signal low.
an_link_ok	phy_tx_clk_i	Out	1	Auto-Negotiation Link Status OK – Active-high signal that indicates that the link is OK. The signal is driven by the auto-negotiation state machine. When auto-negotiation is enabled, the signal asserts when the state machine is in the LINK_OK state. If auto-negotiation is disabled, the signal asserts when the state machine is in the AN_DISABLE_LINK_OK state. See IEEE 802.3 figure 37-6.
<b>Non-Standard RX/TX Signals</b>				
debug_link_timer_short	phy_tx_clk_i	In	1	Debug Link Timer Mode – Active-high signal that forces the auto-negotiation link timer to run much faster than normal. This mode is provided for debug purposes. For example, allowing simulations to run through the auto-negotiation process much faster than normal.
phy_rxval_o	phy_rx_clk_o	Out	1	This signal is used to signal receiving valid data.
phy_txrdy_o	phy_pcs_clk_in_i	Out	1	PHY ready: This signal is asserted when the PHY has completed the calibration sequence for each specific lane. This signal is driven by phy_pcs_clk_in_i.
phyrdy_o	phy_tx_clk_o	Out	1	When asserted, this signal tells you that the PHY is ready to transmit while using mpcs_txval_i.
phy_link_sync_o	phy_rx_clk_o	Out	1	Link Synchronization output port. 1'b1 – link synchronization is acquired. 1'b0 – loss of link synchronization.
phy_ridle_o	phy_rx_clk_o	Out	1	This port is used to signal the Electrical Idle condition detected by the PMA control logic.
<b>APB Interface<sup>1</sup></b>				
apb_pclk_i	sysbus_clk_i	In	1	Clock for Management module (APB interface). It is recommended to use between 20 MHz to 156.25 MHz clock.
apb_preset_n_i	sysbus_clk_i	In	1	Active low reset. Asynchronous assert, synchronous

Port Name	Clock Domain	I/O	Width	Description
				(apb_pclk_i) deassert.
apb_psel_i	sysbus_clk_i	In	1	Completer select.
apb_penable_i	sysbus_clk_i	In	1	Enable. This signal indicates the second and subsequent cycles of an APB transfer.
apb_paddr_i	sysbus_clk_i	In	16	Address.
apb_pwdata_i	sysbus_clk_i	In	16	Write Data.
apb_pwrite_i	sysbus_clk_i	In	1	Indicates write or read access. 0 – Read. 1 – Write.
apb_prdata_o	sysbus_clk_i	Out	16	Read Data.
apb_pready_o	sysbus_clk_i	Out	1	Ready. The completer uses this signal to extend an APB transfer.

**Note:**

1. Only one of the two interfaces is available as selected by the *Register Interface*.

### 4.3. MAC Only Signals

**Table 4.3. Signal Description—MAC Only**

Port Name	Clock Domain	I/O	Width	Description
<b>Clock and Reset</b>				
reset_n_i	Asynchronous	In	1	Active-low asynchronous reset.
rxmac_clk_i	—	In	1	Clock for Receive AXI4-Stream and 16-bit GMII. 156.25 MHz clock for 16-bit interface.
txmac_clk_i	—	In	1	Clock for Transmit AXI4-Stream and GMII datapath. 156.25 MHz clock for 16-bit interface.
sysbus_clk_i	—	In	1	Clock for Management module (APB interface). It is recommended to use between 20 MHz to 156.25 MHz clock for 16-GMII interface.
<b>GMII Interface<sup>2</sup></b>				
gmii_16_rx_d_i	rxmac_clk_i	In	16	16-bit GMII RX data.
gmii_16_rx_dv_i	rxmac_clk_i	In	2	Indicates the GMII RX data is valid when asserted.
gmii_16_rx_err_i	rxmac_clk_i	In	2	Indicates the GMII RX data contains error.
gmii_16_tx_d_o	txmac_clk_i	Out	16	16-bit GMII TX data.
gmii_16_tx_en_o	txmac_clk_i	Out	2	Indicates the GMII TX data is valid when asserted.
gmii_16_tx_err_o	txmac_clk_i	Out	2	Indicates the GMII TX data contains error.
<b>AXI4-Stream Receive Interface</b>				
axis_rx_tdata_o	rxmac_clk_i	Out	64	AXI4-Stream data from PHY to client.
axis_rx_tkeep_o	rxmac_clk_i	Out	8	AXI4-Stream control that indicates which data is valid on axis_rx_tdata_o[ ]. <ul style="list-style-type: none"> <li>• axis_rx_tkeep_o[0]: axis_rx_tdata_o [7:0]</li> <li>• axis_rx_tkeep_o[1]: axis_rx_tdata_o [15:8]</li> <li>• axis_rx_tkeep_o[2]: axis_rx_tdata_o [23:16]</li> <li>• axis_rx_tkeep_o[3]: axis_rx_tdata_o [31:24]</li> <li>• axis_rx_tkeep_o[4]: axis_rx_tdata_o [39:32]</li> <li>• axis_rx_tkeep_o[5]: axis_rx_tdata_o [47:40]</li> <li>• axis_rx_tkeep_o[6]: axis_rx_tdata_o [55:48]</li> <li>• axis_rx_tkeep_o[7]: axis_rx_tdata_o [63:56]</li> </ul>
axis_rx_tvalid_o	rxmac_clk_i	Out	1	AXI4-Stream data valid.
axis_rx_tuser_o	rxmac_clk_i	Out	1	AXI4-Stream user signal used to indicate that the frame had a length error, termination error, or a CRC error. This signal is qualified with the

Port Name	Clock Domain	I/O	Width	Description
				axis_rx_tlast_o signal.
axis_rx_tlast_o	rxmac_clk_i	Out	1	AXI4-Stream signal indicating the end of a packet.
<b>AXI4-Stream Transmit Interface</b>				
axis_tx_tready_o	txmac_clk_i	Out	1	AXI4-Stream signal indicating that the core can accept data transfer.
axis_tx_tdata_i	txmac_clk_i	In	64	AXI4-Stream data from client.
axis_tx_tkeep_i	txmac_clk_i	In	8	AXI4-Stream control that indicates which data is valid on axis_tx_tdata_i [ ]. <ul style="list-style-type: none"> <li>axis_tx_tkeep_i[0]: axis_tx_tdata_i[7:0]</li> <li>axis_tx_tkeep_i[1]: axis_tx_tdata_i[15:8]</li> <li>axis_tx_tkeep_i[2]: axis_tx_tdata_i[23:16]</li> <li>axis_tx_tkeep_i[3]: axis_tx_tdata_i[31:24]</li> <li>axis_tx_tkeep_i[4]: axis_tx_tdata_i[39:32]</li> <li>axis_tx_tkeep_i[5]: axis_tx_tdata_i[47:40]</li> <li>axis_tx_tkeep_i[6]: axis_tx_tdata_i[55:48]</li> <li>axis_tx_tkeep_i[7]: axis_tx_tdata_i[63:56]</li> </ul>
axis_tx_tvalid_i	txmac_clk_i	In	1	AXI4-Stream data valid.
axis_tx_tuser_i	txmac_clk_i	In	1	AXI4-Stream user signal used to indicate an error in the frame. This signal is qualified with the axis_tx_tlast_i signal.
axis_tx_tlast_i	txmac_clk_i	In	1	AXI4-Stream signal indicating the end of a packet.
<b>APB Interface<sup>5</sup></b>				
apb_psel_i	sysbus_clk_i	In	1	Select signal. Indicates that the completer device is selected and a data transfer is required.
apb_paddr_i	sysbus_clk_i	In	32	Address signal.
apb_pwdata_i	sysbus_clk_i	In	32	Write data signal.
apb_pwrite_i	sysbus_clk_i	In	1	Direction signal. Write = 1, Read = 0.
apb_penable_i	sysbus_clk_i	In	1	Enable signal. Indicates the second and subsequent cycles of an APB transfer.
apb_pready_o	sysbus_clk_i	Out	1	Ready signal. Indicates transfer completion. The completer uses this signal to extend an APB transfer.
apb_prdata_o	sysbus_clk_i	Out	32	Read data signal.
apb_pslverr_o	sysbus_clk_i	Out	1	Transfer success or failure signal. Tie to low.
<b>Statistics Vector Interface</b>				
tx_statvec_o	txmac_clk_i	Out	28	Contains information on the frame transmitted. This bus is qualified by the tx_staten_o signal. <ul style="list-style-type: none"> <li>tx_statvec_o[13:0]: Frame byte count</li> <li>tx_statvec_o[14]: Transmit is OK</li> <li>tx_statvec_o[15]: MAC control inserted by MAC</li> <li>tx_statvec_o[16]: MAC control inserted by Client</li> <li>tx_statvec_o[17]: Jumbo frame</li> <li>tx_statvec_o[18]: Tagged frame</li> <li>tx_statvec_o[19]: Broadcast address</li> <li>tx_statvec_o[20]: Multicast address</li> <li>tx_statvec_o[21]: Underrun error</li> <li>tx_statvec_o[22]: CRC error</li> <li>tx_statvec_o[23]: Length check error</li> <li>tx_statvec_o[24]: Terminate error</li> <li>tx_statvec_o[25]: Long Frame error</li> <li>tx_statvec_o[26]: PTP1588 frame</li> <li>tx_statvec_o[27]: Reserved for future use</li> </ul>
tx_staten_o	txmac_clk_i	Out	1	When asserted, it indicates that the contents of the tx_statvec_o bus are valid. This signal is asserted for three txmac_clk_i periods.

Port Name	Clock Domain	I/O	Width	Description
rx_statvec_o	rxmac_clk_i	Out	28	<p>Contains information on the frame received. This bus is qualified by the rx_staten_o signal.</p> <ul style="list-style-type: none"> <li>rx_statvec_o[13:0]: Frame byte count</li> <li>rx_statvec_o[14]: Frame dropped</li> <li>rx_statvec_o[15]: Broadcast frame received</li> <li>rx_statvec_o[16]: Multicast frame received</li> <li>rx_statvec_o[17]: CRC error</li> <li>rx_statvec_o[18]: VLAN Tag detected</li> <li>rx_statvec_o[19]: PAUSE frame</li> <li>rx_statvec_o[20]: Length check error</li> <li>rx_statvec_o[21]: Frame is too long</li> <li>rx_statvec_o[22]: MAC Address mismatch</li> <li>rx_statvec_o[23]: Unsupported opcode. Only the opcode for PAUSE frame is supported.</li> <li>rx_statvec_o[24]: Minimum IPG violated</li> <li>rx_statvec_o[25]: Receive packet ignored</li> <li>rx_statvec_o[26]: PTP1588 frame received</li> <li>rx_statvec_o[27]: Reserved for future use</li> </ul>
rx_staten_o	rxmac_clk_i	Out	1	When asserted, indicates that the contents of the rx_statvec_o bus are valid. This signal is asserted for three rxmac_clk_i periods.
pcsrdy_i	rxmac_clk_i	In	1	This is an active-high level status signal from external PHY. Asserted when the PHY link status is ready. In cases where the local fault/remote fault is sending an earlier signal such as during the reset state, then this signal is used by MAC to determine the PHY link status when out of reset. As a result, the RX_STAT_LINK_OK counter is increased.
<b>TX Pause Frame<sup>6</sup></b>				
tx_pausreq_i	txmac_clk_i	In	1	<p>Transmit PAUSE frame.</p> <p>1 = send request, 0 = do not send request. This is a positive edge-triggered bit.</p> <p>The tx_fc_en bit of TX_CTL register should be set to 1 to enable this feature.</p> <p>When this port is enabled, the tx_pausreq bit of MAC_CTL register is not accessible.</p> <p>Subsequent pause request will not be serviced if the pause frame of the first request is not transmitted yet.</p>
tx_paustm_i	txmac_clk_i	In	16	<p>Pause Quanta time.</p> <p>This is equivalent to the tx_paustim bit of the PAUSE_TM register.</p>

**Notes:**

1. Available when APB is selected as Host Interface.
2. Available when TX Pause Frame Generation via Ports is enabled.

## 4.4. MAC + PHY Signals (Avant Devices)

**Table 4.4. Signal Description—MAC + PHY**

Port Name	Clock Domain	I/O	Width	Description
<b>Clock and Reset</b>				
reset_n_i	Asynchronous	In	1	Active-low asynchronous reset.
phy_tx_clk_o	—	Out	1	TX clock output (156.25 MHz).
phy_rx_clk_o	—	Out	1	RX clock output (156.25 MHz).
phy_tx_gclk_o	—	Out	2	TX clock forwarded to global clock distribution (156.25 MHz).
phy_rx_gclk_o	—	Out	1	RX clock forwarded to global clock distribution (156.25 MHz).
txmac_clk_i	—	In	1	156.25 MHz clock for MAC interface. It's recommended to use

Port Name	Clock Domain	I/O	Width	Description
				phy_tx_gclk_o[0] as input.
rxmac_clk_i	—	In	1	156.25 MHz clock for MAC interface. It's recommended to use phy_rx_gclk_o as input.
sysbus_clk_i	—	In	1	Clock for the Management module (AXI4-Lite interface). It is recommended to use between 20 MHz to 156.25 MHz clock for XGMII interface.
phy_pcs_clkin_i	—	In	1	This clock also drives the PMA epcs_clkin_i clock port with 156.25 MHz.
<b>Serial I/O</b>				
pad_refclkn_i	—	In	1	156.25 MHz SERDES PLL reference clock signal (-).
pad_refclkp_i	—	In	1	156.25 MHz SERDES PLL reference clock signal (+).
pad_rxn_i	pad_refclkn_i	In	1	RX- differential signal.
pad_rxp_i	pad_refclkp_i	In	1	RX+ differential signal.
pad_txn_o	pad_refclkn_i	Out	1	TX- differential signal.
pad_txp_o	pad_refclkp_i	Out	1	TX+ differential signal.
<b>AXI4-Stream Receive Interface</b>				
axis_rx_tdata_o	phy_tx_gclk_o[0] <sup>4</sup>	Out	64	AXI4-Stream data from PHY to the client.
axis_rx_tkeep_o	phy_tx_gclk_o[0] <sup>4</sup>	Out	8	AXI4-Stream control that indicates which data is valid on axis_rx_tdata_o [ ]. <ul style="list-style-type: none"> <li>axis_rx_tkeep_o[0]: axis_rx_tdata_o [7:0]</li> <li>axis_rx_tkeep_o[1]: axis_rx_tdata_o [15:8]</li> <li>axis_rx_tkeep_o[2]: axis_rx_tdata_o [23:16]</li> <li>axis_rx_tkeep_o[3]: axis_rx_tdata_o [31:24]</li> <li>axis_rx_tkeep_o[4]: axis_rx_tdata_o [39:32]</li> <li>axis_rx_tkeep_o[5]: axis_rx_tdata_o [47:40]</li> <li>axis_rx_tkeep_o[6]: axis_rx_tdata_o [55:48]</li> <li>axis_rx_tkeep_o[7]: axis_rx_tdata_o [63:56]</li> </ul>
axis_rx_tvalid_o	phy_tx_gclk_o[0] <sup>4</sup>	Out	1	AXI4-Stream data valid.
axis_rx_tuser_o	phy_tx_gclk_o[0] <sup>4</sup>	Out	1	AXI4-Stream user signal used to indicate that the frame had a length error, termination error, or a cyclic redundancy check (CRC) error. This signal is qualified with the axis_rx_tlast_o signal.
axis_rx_tlast_o	phy_tx_gclk_o[0] <sup>4</sup>	Out	1	AXI4-Stream signal indicating the end of a packet.
<b>AXI4-Stream Transmit Interface</b>				
axis_tx_tready_o	phy_tx_gclk_o[0] <sup>4</sup>	Out	1	AXI4-Stream signal indicating that the core can accept data transfer.
axis_tx_tdata_i	phy_tx_gclk_o[0] <sup>4</sup>	In	64	AXI4-Stream data from the client.
axis_tx_tkeep_i	phy_tx_gclk_o[0] <sup>4</sup>	In	8	AXI4-Stream control that indicates which data is valid on axis_tx_tdata_i [ ]. <ul style="list-style-type: none"> <li>axis_tx_tkeep_i[0]: axis_tx_tdata_i[7:0]</li> <li>axis_tx_tkeep_i[1]: axis_tx_tdata_i[15:8]</li> <li>axis_tx_tkeep_i[2]: axis_tx_tdata_i[23:16]</li> <li>axis_tx_tkeep_i[3]: axis_tx_tdata_i[31:24]</li> <li>axis_tx_tkeep_i[4]: axis_tx_tdata_i[39:32]</li> <li>axis_tx_tkeep_i[5]: axis_tx_tdata_i[47:40]</li> <li>axis_tx_tkeep_i[6]: axis_tx_tdata_i[55:48]</li> <li>axis_tx_tkeep_i[7]: axis_tx_tdata_i[63:56]</li> </ul>
axis_tx_tvalid_i	phy_tx_gclk_o[0] <sup>4</sup>	In	1	AXI4-Stream data valid.
axis_tx_tuser_i	phy_tx_gclk_o[0] <sup>4</sup>	In	1	AXI4-Stream user signal to indicate an error in the frame. This signal is qualified with the axis_tx_tlast_i signal.
axis_tx_tlast_i	phy_tx_gclk_o[0] <sup>4</sup>	In	1	AXI4-Stream signal indicating the end of a packet.
<b>Auto-Negotiation</b>				
mr_adv_ability	phy_tx_clk_o	in	16	Advertised Ability—Configuration status transmitted by PCS during

Port Name	Clock Domain	I/O	Width	Description
				auto-negotiation process.
mr_an_enable	phy_tx_clk_o	in	1	Auto-Negotiation Enable - Active-high signal that enables auto-negotiation state machine to function.
mr_main_reset	phy_tx_clk_o	in	1	Main Reset—Active-high signal that forces all PCS state machines to reset.
mr_restart_an	phy_tx_clk_o	in	1	Auto-Negotiation Restart—Active-high signal that forces auto-negotiation process to restart.
mr_an_complete	phy_tx_clk_o	out	1	Auto-Negotiation Complete—Active-high signal that indicates that the auto-negotiation process is completed.
mr_lp_adv_ability	phy_tx_clk_o	out	16	Link Partner Advertised Ability—Configuration status received from partner PCS entity during the auto-negotiation process. The bit definitions are the same as described above for the mr_adv_ability port
mr_page_rx	phy_tx_clk_o	out	1	Auto-Negotiation Page Received—Active-high signal that asserts while the auto-negotiation state machine is in the <i>Complete_Acknowledge</i> state.
xmit_autoneg	phy_tx_clk_o	out	1	Auto-negotiation XMIT Status —This signal should be tied to the “xmit_chn” pin of the SERDES. When the signal is high, it forces the Rx data path of the SERDES to periodically insert idle-code groups into the SERDES Rx data stream. This ensures that the SERDES CTC has opportunities to rate-adapt for ppm offsets. The 2.5G Ethernet PCS IP core drives this signal high when the auto-negotiation process is running. At all other times, the IP core drives this signal low.
an_link_ok	phy_tx_clk_o	Out	1	Auto-Negotiation Link Status OK—Active-high signal that indicates that the link is OK. The signal is driven by the auto-negotiation state machine. When auto-negotiation is enabled, the signal asserts when the state machine is in the LINK_OK state. If auto-negotiation is disabled, the signal asserts when the state machine is in the AN_DISABLE_LINK_OK state. See IEEE 802.3 figure 37-6.
<b>Non-Standard RX/TX Signals</b>				
phyrdy_o	phy_tx_gclk_o[0] <sup>4</sup>	Out	1	The high level of this signal indicates alignment is achieved and RX PCS is ready for transaction.
phy_rxval_o	phy_rx_gclk_o	Out	1	This signal is used to signal receiving valid data.
phy_init_done_o	phy_tx_gclk_o[0] <sup>4</sup>	Out	1	The high level of this signal indicates alignment is PHY initialization or reset is done.
phy_link_sync_o	phy_rx_gclk_o	Out	1	Link synchronization is acquired.
pma_rx0_sigdet_hf_o	phy_rx_gclk_o	Out	1	Receive high-frequency signal detection output. When asserted, indicates that the receiver is receiving high-frequency signals.
pma_rx0_sigdet_lf_o	phy_rx_gclk_o	Out	1	Receive low-frequency signal detection output. When asserted, this signal indicates that the receiver is receiving low-frequency signals.
debug_link_timer_short	phy_tx_gclk_o	In	1	Debug Link Timer Mode—Active-high signal that forces the auto-negotiation link timer to run faster than normal. This mode is provided for debug purposes. For example, allowing simulations to run through the auto-negotiation process faster than normal.
<b>APB Interface<sup>1</sup></b>				
apb_psel_i	sysbus_clk_i	In	1	Select signal. Indicates that the completer device is selected, and a data transfer is required.
apb_paddr_i	sysbus_clk_i	In	32	Address signal.
apb_pwdata_i	sysbus_clk_i	In	32	Write data signal.
apb_pwrite_i	sysbus_clk_i	In	1	Direction signal. Write = 1, Read = 0.
apb_penable_i	sysbus_clk_i	In	1	Enable signal. Indicates the second and subsequent cycles of an APB transfer.
apb_pready_o	sysbus_clk_i	Out	1	Ready signal. Indicates transfer completion. The completer uses this

Port Name	Clock Domain	I/O	Width	Description
				signal to extend an APB transfer.
apb_prdata_o	sysbus_clk_i	Out	32	Read data signal.
apb_pslverr_o	sysbus_clk_i	Out	1	Transfer success/failure signal. Tie to low.
apb_psel_i	sysbus_clk_i	In	1	Select signal. Indicates that the completer device is selected, and a data transfer is required.
apb_paddr_i	sysbus_clk_i	In	32	Address signal.
apb_pwdata_i	sysbus_clk_i	In	32	Write data signal.
apb_pwrite_i	sysbus_clk_i	In	1	Direction signal. Write = 1, Read = 0.
<b>AXI4-Lite Interface<sup>2</sup></b>				
axi4l_awaddr_i	sysbus_clk_i	In	32	Write address bus.
axi4l_awvalid_i	sysbus_clk_i	In	1	Write address valid.
axi4l_awready_o	sysbus_clk_i	Out	1	Write address acknowledge.
axi4l_wdata_i	sysbus_clk_i	In	32	Write data bus.
axi4l_wvalid_i	sysbus_clk_i	In	1	Write data valid.
axi4l_wready_o	sysbus_clk_i	Out	1	Write data acknowledge.
axi4l_wstrb_i	sysbus_clk_i	In	4	AXI4-Lite write strobe. This feature is not supported so tied to 0.
axi4l_bresp_o	sysbus_clk_i	Out	2	Write transaction response.
axi4l_bvalid_o	sysbus_clk_i	Out	1	Write response valid.
axi4l_bready_i	sysbus_clk_i	In	1	Write response acknowledge.
axi4l_araddr_i	sysbus_clk_i	In	32	Read address bus.
axi4l_arvalid_i	sysbus_clk_i	In	1	Read address valid.
axi4l_arready_o	sysbus_clk_i	Out	1	Read address acknowledge.
axi4l_rdata_o	sysbus_clk_i	Out	32	Read data output.
axi4l_rresp_o	sysbus_clk_i	Out	2	Read data response.
axi4l_rvalid_o	sysbus_clk_i	Out	1	Read data/response valid.
axi4l_rready_i	sysbus_clk_i	In	1	Read data acknowledge.
<b>Statistics Vector Interface</b>				
tx_statvec_o	phy_tx_gclk_o[0] <sup>4</sup>	Out	28	<p>Contains information on the frame transmitted. This bus is qualified by the tx_staten_o signal.</p> <ul style="list-style-type: none"> <li>tx_statvec_o[13:0]: Frame byte count.</li> <li>tx_statvec_o[14]: Transmit is OK.</li> <li>tx_statvec_o[15]: MAC control inserted by MAC.</li> <li>tx_statvec_o[16]: MAC control inserted by client.</li> <li>tx_statvec_o[17]: Jumbo frame.</li> <li>tx_statvec_o[18]: Tagged frame.</li> <li>tx_statvec_o[19]: Broadcast address.</li> <li>tx_statvec_o[20]: Multicast address.</li> <li>tx_statvec_o[21]: Underrun error.</li> <li>tx_statvec_o[22]: CRC error.</li> <li>tx_statvec_o[23]: Length check error.</li> <li>tx_statvec_o[24]: Terminate error.</li> <li>tx_statvec_o[25]: Long frame error.</li> <li>tx_statvec_o[26]: PTP1588 frame.</li> <li>tx_statvec_o[27]: Reserved for future use.</li> </ul>
tx_staten_o	phy_tx_gclk_o[0] <sup>4</sup>	Out	1	When asserted, this signal indicates that the contents of the tx_statvec_o bus are valid. This signal is asserted for three txmac_clk_i periods.
rx_statvec_o	phy_tx_gclk_o[0] <sup>4</sup>	Out	28	<p>Contains information on the frame received. This bus is qualified by the rx_staten_o signal.</p> <ul style="list-style-type: none"> <li>rx_statvec_o[13:0]: Frame byte count.</li> </ul>

Port Name	Clock Domain	I/O	Width	Description
				<ul style="list-style-type: none"> <li>rx_statvec_o[14]: Frame dropped.</li> <li>rx_statvec_o[15]: Broadcast frame received.</li> <li>rx_statvec_o[16]: Multicast frame received.</li> <li>rx_statvec_o[17]: CRC error.</li> <li>rx_statvec_o[18]: VLAN tag detected.</li> <li>rx_statvec_o[19]: Pause frame.</li> <li>rx_statvec_o[20]: Length check error.</li> <li>rx_statvec_o[21]: Frame is too long.</li> <li>rx_statvec_o[22]: MAC address mismatch.</li> <li>rx_statvec_o[23]: Unsupported opcode. Only the opcode for pause frame is supported.</li> <li>rx_statvec_o[24]: Minimum IPG violated.</li> <li>rx_statvec_o[25]: Receive packet ignored.</li> <li>rx_statvec_o[26]: PTP1588 frame received.</li> <li>rx_statvec_o[27]: Reserved for future use.</li> </ul>
rx_staten_o	phy_tx_gclk_o[0] <sup>4</sup>	Out	1	When asserted, indicates that the contents of the rx_statvec_o bus are valid. This signal is asserted for three rxmac_clk_i periods.
<b>TX Pause Frame<sup>3</sup></b>				
tx_pausreq_i	phy_tx_gclk_o[0] <sup>4</sup>	In	1	Transmit pause frame. 1 = send request, 0 = do not send request. This is a positive edge-triggered bit. The tx_fc_en bit of TX_CTL register should be set to 1 to enable this feature. When this port is enabled, the tx_pausreq bit of MAC_CTL register is not accessible. Subsequent pause request will not be serviced if the pause frame of the first request is not transmitted yet.
tx_paustm_i	phy_tx_gclk_o[0] <sup>4</sup>	In	16	Pause Quanta time. This is equivalent to the tx_paustim bit of PAUSE_TM register.

**Notes:**

1. Available when APB is selected as the Host Interface.
2. Available when AXI4-Lite is selected as the Host Interface.
3. Available when TX Pause Frame Generation via Ports is enabled.
4. For XGMII configuration, it is recommended to use xg\_tx\_gclk\_o[0] or xg\_tx\_clk\_o.

## 4.5. PHY Only Signals (Avant Devices)

**Table 4.5. Signal Description—PHY Only (Avant Devices)**

Port Name	Clock Domain	I/O	Width	Description
<b>Serial I/O</b>				
pad_refclk_i	—	In	1	156.25 MHz SERDES PLL reference clock signal (-).
pad_refclkp_i	—	In	1	156.25 MHz SERDES PLL reference clock signal (+).
pad_rxn_i	pad_refclk_i	In	1	RX- differential signal.
pad_rxp_i	pad_refclkp_i	In	1	RX+ differential signal.
pad_txn_o	pad_refclk_i	Out	1	TX- differential signal.
pad_txp_o	pad_refclkp_i	Out	1	TX+ differential signal.
<b>Clock and Reset</b>				
phy_tx_clk_i	—	In	1	TX clock input – 156.25 MHz clock for transmit data path. It is recommended to use phy_tx_gclk_o[0] or phy_tx_clk_o.
phy_tx_rst_n_i	Asynchronous	In	1	RX active low reset. Asynchronous assert, synchronous (phy_tx_clk_i) deassert.

Port Name	Clock Domain	I/O	Width	Description
phy_rx_clk_i	—	In	1	RX clock input – 156.25 MHz clock for receive data path. It is recommended to use phy_tx_gclk_o[0] or phy_tx_clk_o.
phy_tx_clk_o	—	Out	1	TX clock output (156.25 MHz).
phy_rx_rst_n_i	Asynchronous	In	1	RX active low reset. Asynchronous assert, synchronous (phy_rx_clk_i) deassert.
phy_rx_clk_o	—	Out	1	RX clock output (156.25 MHz).
phy_tx_gclk_o	—	Out	2	TX clock forwarded to global clock distribution (156.25 MHz).
phy_rx_gclk_o	—	Out	1	RX clock forwarded to global clock distribution (156.25 MHz).
phy_pcs_clk_in_i	—	In	1	This clock also drives the PMA epcs_clk_in_i clock port with 156.25 MHz.
reset_n_i	Asynchronous	In	1	Active-low asynchronous reset.
sysbus_clk_i	—	In	1	Clock for Management module. It is recommended to use 100 MHz.
<b>16-bit GMII</b>				
gmii_16_tx_en_i	phy_tx_clk_i	In	2	2-bit active-high signal that asserts when incoming GMII data is valid. bit[0] is the valid signal for gmii_16_tx_d_i [7:0] bit[1] is the valid signal for gmii_16_tx_d_i [15:8] gmii_16_tx_en_i [1] is associated with the upper byte of the GMII data (bits 15:8). gmii_16_tx_en_i [0] is associated with the lower byte of the GMII data (bits 7:0). Note that when an Ethernet frame is being transmitted, most of the time both transmit enable bits are asserted simultaneously. However, at the beginning and end of the frame, it is possible for only one of the two GMII data bytes to be valid. A GMII data frame can begin and end on any byte (upper or lower).
gmii_16_tx_d_i	phy_tx_clk_i	In	16	16-bit TX data signal.
gmii_16_tx_err_i	phy_tx_clk_i	In	2	Transmit Error—2-bit, active-high signal that denotes transmission errors or carrier extension events on the GMII Tx data port. gmii_16_tx_err_i [1] is associated with the upper byte of the GMII data. gmii_16_tx_err_i [0] is associated with the lower byte of the GMII data.
gmii_16_rx_dv_o	phy_rx_clk_i	Out	2	Receive Data Valid—2-bit, active-high signal that asserts when outgoing GMII data is valid. gmii_16_rx_dv_o [1] is associated with the upper byte of the GMII data (bits 15:8). gmii_16_rx_dv_o [0] is associated with the lower byte of the GMII data (bits 7:0). Note that when an Ethernet frame is being received, most of the time both receive valid bits are asserted simultaneously. However, at the beginning and end of the frame, it is possible for only one of the two GMII data bytes to be valid. A GMII data frame can begin and end on any byte (upper or lower).
gmii_16_rx_d_o	phy_rx_clk_i	Out	16	16-bit RX data signal.
gmii_16_rx_err_o	phy_rx_clk_i	Out	2	Receive Error—2-bit, active-high signal that denotes transmission errors or carrier extension events on the GMII Rx data port. gmii_16_rx_err_o [1] is associated with the upper byte of the GMII data. gmii_16_rx_err_o [0] is associated with the lower byte of the

Port Name	Clock Domain	I/O	Width	Description
				GMII data.
<b>Auto-Negotiation</b>				
mr_adv_ability	phy_tx_clk_i	in	16	Advertised Ability—Configuration status transmitted by PCS during auto-negotiation process.
mr_an_enable	phy_tx_clk_i	in	1	Auto-Negotiation Enable—Active-high signal that enables auto-negotiation state machine to function.
mr_main_reset	phy_tx_clk_i	in	1	Main Reset—Active-high signal that forces all PCS state machines to reset.
mr_restart_an	phy_tx_clk_i	in	1	Auto-Negotiation Restart—Active-high signal that forces auto-negotiation process to restart.
mr_an_complete	phy_tx_clk_i	out	1	Auto-Negotiation Complete—Active-high signal that indicates that the auto-negotiation process is completed.
mr_lp_adv_ability	phy_tx_clk_i	out	16	Link Partner Advertised Ability Configuration status received from partner PCS entity during the auto-negotiation process. The bit definitions are the same as described above for the mr_adv_ability port.
mr_page_rx	phy_tx_clk_i	out	1	Auto-Negotiation Page Received—Active-high signal that asserts while the auto-negotiation state machine is in the <i>Complete_Acknowledge</i> state.
xmit_autoneg	phy_tx_clk_i	out	1	Auto-negotiation XMIT Status – This signal should be tied to the “xmit_chn” pin of the SerDes. When the signal is high, it forces the Rx data path of the SerDes to periodically insert idle-code groups into the SerDes RX data stream. This ensures that SerDes CTC has opportunities to rate-adapt for ppm offsets. The 2.5G Ethernet PCS IP core drives this signal high when the auto-negotiation process is running. At all other times, the IP core drives this signal low.
an_link_ok	phy_tx_clk_i	Out	1	Auto-Negotiation Link Status OK – Active-high signal that indicates that the link is OK. The signal is driven by the auto-negotiation state machine. When auto-negotiation is enabled, the signal asserts when the state machine is in the LINK_OK state. If auto-negotiation is disabled, the signal asserts when the state machine is in the AN_DISABLE_LINK_OK state. See IEEE 802.3 figure 37-6.
<b>Non-Standard RX/TX Signals</b>				
phy_rxval_o	phy_rx_clk_i	Out	1	This signal is used to signal receiving valid data.
phyrdy_o	phy_tx_clk_i	Out	1	The high level of this signal indicates alignment is achieved and RX PCS is ready for transaction.
phy_init_done_o	phy_tx_clk_i	Out	1	The high level of this signal indicates alignment is PHY initialization or reset is done.
phy_link_sync_o	phy_rx_clk_i	Out	1	Link synchronization is acquired.
pma_rx0_sigdet_hf_o	phy_rx_clk_i	Out	1	Receive high-frequency signal detection output. When asserted, indicates that the receiver is receiving high-frequency signals.
pma_rx0_sigdet_lf_o	phy_rx_clk_i	Out	1	Receive low-frequency signal detection output. When asserted, this signal indicates that the receiver is receiving low-frequency signals.
debug_link_timer_short	phy_tx_clk_i	In	1	Debug Link Timer Mode—Active-high signal that forces the auto-negotiation link timer to run faster than normal. This mode is provided for debug purposes. For example, allowing simulations to run through the auto-negotiation process faster than normal.
<b>AXI4-Lite Interface<sup>1</sup></b>				
axi4l_awaddr_i	sysbus_clk_i	In	32	Write address bus.

Port Name	Clock Domain	I/O	Width	Description
axi4l_awvalid_i	sysbus_clk_i	In	1	Write address valid.
axi4l_awready_o	sysbus_clk_i	Out	1	Write address acknowledge.
axi4l_wdata_i	sysbus_clk_i	In	32	Write data bus.
axi4l_wvalid_i	sysbus_clk_i	In	1	Write data valid.
axi4l_wready_o	sysbus_clk_i	Out	1	Write data acknowledge.
axi4l_wstrb_i	sysbus_clk_i	In	4	AXI4-Lite write strobe. This feature is not supported so it is tied to 0.
axi4l_bresp_o	sysbus_clk_i	Out	2	Write transaction response.
axi4l_bvalid_o	sysbus_clk_i	Out	1	Write response valid.
axi4l_bready_i	sysbus_clk_i	In	1	Write response acknowledge.
axi4l_araddr_i	sysbus_clk_i	In	32	Read address bus.
axi4l_arvalid_i	sysbus_clk_i	In	1	Read address valid.
axi4l_arready_o	sysbus_clk_i	Out	1	Read address acknowledge.
axi4l_rdata_o	sysbus_clk_i	Out	32	Read data output.
axi4l_rresp_o	sysbus_clk_i	Out	2	Read data response.
axi4l_rvalid_o	sysbus_clk_i	Out	1	Read data/response valid.
axi4l_rready_i	sysbus_clk_i	In	1	Read data acknowledge.
<b>APB Interface<sup>1</sup></b>				
apb_psel_i	sysbus_clk_i	In	1	Select signal. Indicates that the completer device is selected and a data transfer is required.
apb_paddr_i	sysbus_clk_i	In	32	Address signal.
apb_pwdata_i	sysbus_clk_i	In	32	Write data signal.
apb_pwrite_i	sysbus_clk_i	In	1	Direction signal. Write = 1, Read = 0.
apb_penable_i	sysbus_clk_i	In	1	Enable signal. Indicates the second and subsequent cycles of an APB transfer.
apb_pready_o	sysbus_clk_i	Out	1	Ready signal. Indicates transfer completion. The completer uses this signal to extend an APB transfer.
apb_prdata_o	sysbus_clk_i	Out	32	Read data signal.
apb_pslvrr_o	sysbus_clk_i	O	1	Transfer success/failure signal. Tie to low.

**Note:**

1. Only one of the two interfaces is available as selected by the Host Interface.

## 5. Register Description

### 5.1. MAC + PHY Registers (CertusPro-NX Devices)

The registers available in the Ethernet MAC + PHY option include all registers from the MAC and PHY.

For register descriptions in the 2.5G MAC and PHY, refer to the [MAC Registers](#) and [PHY Registers \(CertusPro-NX Devices\)](#) sections.

**Note:** With the MAC + PHY selected as the IP option, only the APB interface is available for access to both PCS and MAC registers. MMD registers are not accessible with this IP option.

#### 5.1.1. Register Address Mapping

The following table lists the address decoding for the MAC and PHY blocks. The base address must be adjusted accordingly to access each individual registers in the respective blocks.

**Table 5.1. Register Address Mapping**

Block	APB Base Address
MAC	0x0000 – 0x3FFF
PHY	0x5000 onwards

### 5.2. MAC + PHY Registers (Avant Devices)

The registers available in the Ethernet MAC + PHY option include all registers from the MAC and PHY.

For register descriptions in the 2.5G MAC and PHY, refer to the [MAC Registers](#) and [PHY Registers \(Avant Devices\)](#) sections.

#### 5.2.1. Register Address Mapping

The following table lists the address decoding for the MAC and PHY blocks. The base address must be adjusted accordingly to access each individual registers in the respective blocks.

**Table 5.2. Register Address Mapping**

Block	APB Base Address
MAC	0x0000 – 0x3FFF
PHY	0x5000 onwards

**Note:** With the MAC + PHY selected as the IP option, only the APB interface is available for access to both PCS and MAC registers. MMD registers are not accessible with this IP option.

### 5.3. MAC Registers

All registers are accessed through the APB interface when the IP is configured as *MAC Only*.

**Table 5.3. Access Types for MAC Only**

Access Type	Behavior on Read Access	Behavior on Write Access
RO	Returns register value.	Ignores write access.
WO	Returns 0.	Updates register value.
RW	Returns register value.	Updates register value.
RW1C	Returns register value.	Writing 1'b1 on register bit clears the bit to 1'b0. Writing 1'b0 on register bit is ignored.
Reserved	Returns 0.	Ignores write access.

### 5.3.1. Configuration Registers for MAC

The following table lists the 2.5G MAC configuration registers.

**Table 5.4. Configuration Registers for MAC**

Offset	Register Name	Access	Description
0x000	MODE	RW	Mode of Operation Register.
0x004	TX_CTL	RW	Transmit MAC Control Register.
0x008	RX_CTL	RW	Receive MAC Control Register.
0x00C	MAX_PKT_LNGTH	RW	Maximum Packet Size Register.
0x014	MAC_ADDR_0	RW	MAC Address Register Word 0.
0x018	MAC_ADDR_1	RW	MAC Address Register Word 1.
0x01C	TX_RX_STS	RO	Transmit and Receive Status Register.
0x020	VLAN_TAG	RO	VLAN Tag Register.
0x024	MC_TABLE_0	RW	Multicast Tables Register Word 0.
0x028	MC_TABLE_1	RW	Multicast Tables Register Word 1.
0x02C	PAUSE_OPCODE	RO	Pause Opcode .
0x030	MAC_CTL	RW	MAC Control Register.
0x034	PAUSE_TM	RW	Pause Time Register

#### 5.3.1.1. [0x000] MODE Register

This register enables the operation of the MAC. It can be written at any time.

**Table 5.5. [0x000] MODE Register**

Bit	Name	Description	Default
[31:2]	Reserved	Reserved bits.	0
[1]	tx_en	TX MAC Enable When set to 1, the TX MAC is enabled to transmit frames.	0
[0]	rx_en	RX MAC Enable When set to 1, the RX MAC is enabled to receive frames.	0

#### 5.3.1.2. [0x004] TX\_CTL Register

This register must be overwritten only when the TX MAC is disabled. Writing this register while TX MAC is active results in unpredictable behavior.

**Table 5.6. [0x004] TX\_CTL Register**

Bit	Name	Description	Default
[31:4]	Reserved	Reserved bits.	0
[3]	transmit_short	Transmit Short Frames. When set to 1, the TX MAC transmits frames shorter than 64 bytes without adding padding bytes. When set to 0, TX MAC adds padding bytes when frames are shorter than 64 bytes before transmitted to the PHY.	0
[2]	Reserved	Reserved bits.	0
[1]	tx_fc_en	Flow-control Enable. When set to 1, this enables the flow control functionality of the TX MAC. This bit must be set for the TX MAC to transmit a pause frame.	0
[0]	tx_pass_fcs	In-band FCS Enable. When set to 1, the FCS field generation is disabled in the TX MAC, and the client is responsible to generate the appropriate FCS field.	0

### 5.3.1.3. [0x008] RX\_CTL Register

This register must be overwritten only when the RX MAC is disabled. Writing this register while RX MAC is active results in unpredictable behavior.

**Table 5.7. [0x008] RX\_CTL Register**

Bit	Name	Description	Default
[15:7]	Reserved	Reserved bits.	0
[6]	drop_mac_ctrl	Drop MAC Control Frames. When set to 1, all MAC control frames are not passed on to the client interface.	0
[5]	receive_short	Receive Short Frames. When set to 1, it enables the RX MAC to receive frames shorter than 64 bytes.	0*
[4]	receive_bc	Receive Broadcast Frames. When set to 1, it enables the RX MAC to receive broadcast frames.	0
[3]	receive_all_mc	Receive Multicast Frames. When set to 1, the multicast frames are received per the filtering rules for such frames. When set to 0, no multicast (except pause frames) frames are received.	0
[2]	rx_pause_en	Receive Pause Frames. When set to 1, the RX MAC indicates the pause frame reception to the TX MAC. Pause frames are received and transferred to the AXI4-Stream interface only when the drop_mac_ctrl bit is not set.	0
[1]	rx_pass_fcs	In-band FCS Passing. When set to 1, the FCS and any of the padding bytes are passed to the AXI4-Stream interface. When set to 0, the MAC strips off the FCS and any padding bytes before transferring it to the AXI4-Stream interface.	0
[0]	prms	Promiscuous Mode. When set to 1, all filtering schemes are abandoned, and the RX MAC receives frames with any address.	0

\* **Note:** If the L/T value is less than 46 bytes, it detects as short frame, and it will not be dropped. If the L/T value is less than 46 bytes but the payload is more than the defined value, then the extra payload will be treated as the padded byte.

### 5.3.1.4. [0x00C] MAX\_PKT\_LNGTH Register

This register must be overwritten only when the MAC is disabled. All frames longer than the value (number of bytes) in this register is tagged as long frames. Writing this register while the MAC is active results in unpredictable behavior.

**Table 5.8. [0x00C] MAX\_PKT\_LNGTH Register**

Bit	Name	Description	Default
[31:14]	Reserved	Reserved bits.	0
[13:0]	max_pkt_len	Maximum Frame Length. Used only for statistical purposes, all frames longer than the value given here are marked as long. This value does not affect the frame's reception.	1518

### 5.3.1.5. [0x014] MAC\_ADDR\_0 and [0x018] MAC\_ADDR\_1 Register

The MAC address is stored in the registers in hexadecimal form. For example, to set the MAC address to: AC-DE-48-00-00-80 would require writing 0x48\_00\_00\_80 to address 0x014 (MAC\_ADDR\_0). 0xAC\_DE to address 0x018 (MAC\_ADDR\_1).

**Table 5.9. [0x014] MAC\_ADDR\_0 Register**

Bit	Name	Description	Default
[31:0]	mac_addr_0	First four bytes of the MAC address. Ethernet address assigned to the port that is supported by the MAC.	0

**Table 5.10. [0x018] MAC\_ADDR\_1 Register**

Bit	Name	Description	Default
[31:16]	Reserved	Reserved bits.	0
[15:0]	mac_addr_1	Last two bytes of the MAC address. Ethernet address assigned to the port that is supported by the MAC.	0

**5.3.1.6. [0x01C] TX\_RX\_STS Register****Table 5.11. [0x01C] TX\_RX\_STS Register**

Bit	Name	Description	Default
[31:5]	Reserved	Reserved bits.	0
[4]	link_ok	Link is OK. When set to 1, this indicates that no fault symbols were received on the link.	0
[3]	remote_fault	Remote fault. When set to 1, this indicates that remote fault symbols were received on the link.	0
[2]	local_fault	Local fault. When set to 1, this indicates that local fault symbols were received on the link.	0
[1]	rx_idle	Receive MAC idle. When set to 1, this indicates that the RX MAC is inactive.	0
[0]	tx_idle	Transmit MAC idle. When set to 1, this indicates that the TX MAC is inactive.	0

**5.3.1.7. [0x020] VLAN\_TAG Register**

This register has the VLAN tag field of the most recent tagged frame that was received.

**Table 5.12. [0x020] VLAN\_TAG Register**

Bit	Name	Description	Default
[31:16]	Reserved	Reserved bits.	0
[15:0]	vlan_tag	VLAN tag ID.	0

**5.3.1.8. [0x024] MC\_TABLE\_0 and [0x028] MC\_TABLE\_1 Register**

When the core is programmed to receive multicast frames, a filtering scheme is used to decide whether the frame should be received or not. This 64-bit matrix forms the hash table that is used to filter out the incoming multicast frames. For details, refer to the [Receive MAC](#) section.

**Table 5.13. [0x024] MC\_TABLE\_0 Register**

Bit	Name	Description	Default
[31:0]	mc_table_0	Multicast Table Word 0. First 4-bytes of the 64-bit hash.	0

**Table 5.14. [0x028] MC\_TABLE\_1 Register**

Bit	Name	Description	Default
[31:0]	mc_table_1	Multicast Table Word 1. Last 4-bytes of the 64-bit hash.	0

### 5.3.1.9. [0x02C] PAUSE\_OPCODE Register

This register contains the pause opcode. This is compared against the opcode in the received pause frame. This value is also included in any pause frame transmitted by the MAC.

**Table 5.15. [0x02C] PAUSE\_OPCODE Register**

Bit	Name	Description	Default
[31:16]	Reserved	Reserved bits.	0
[15:0]	pause_opcode	Pause opcode.	16'h0001

### 5.3.1.10. [0x030] MAC\_CTL Register

**Table 5.16. [0x030] MAC\_CTL Register**

Bit	Name	Description	Default
[31:5]	Reserved	Reserved bits.	—
[4]	ignore_pkt	Ignore packet. When set to 1, the RX MAC ignores or drops incoming packets.	0
[3:1]	Reserved	Reserved bits.	
[0]	tx_pausreq	Transmit pause frame. 1 = send request, 0 = do not send request. This is a positive edge-triggered bit. The tx_fc_en bit of TX_CTL register must be set to 1 to enable this feature. Set this register to 1 during the send request, maintaining it for at least the hold time specified below before resetting it to 0. The standard maximum frame size of 1,518 bytes requires a hold time of 1214.4 ns. The super jumbo frame size of 9,600 bytes requires a hold time of 7680 ns.	0

### 5.3.1.11. [0x034] PAUSE\_TM Register

This register has the pause time for a flow control packet sourced by the 2.5G MAC transmitter.

**Table 5.17. [0x034] PAUSE\_TM Register**

Bit	Name	Description	Default
[31:16]	Reserved	Reserved bits.	—
[15:0]	tx_paustim	Pause duration.	0

## 5.3.2. Statistics Counters

These statistic counters are wraparound counters and can only be reset when the system reset is asserted. The default value of these counters is 0.

The register name with “\_0” refers to the least significant word of the counter and “\_1” refers to the most significant word.

**Table 5.18. Summary of Statistics Counters**

Offset	Register Name	Access	Description
0x044	TX_STAT_PKT_LENGTH_0	RO	Transmit Packet Length Statistics Counter. Indicates the total number of octets transmitted in a particular frame. tx_statvec_o[13:0] is used to implement this counter.
0x048	TX_STAT_PKT_LENGTH_1	RO	
0x04C	TX_STAT_ERR_0	RO	Transmit TX Error Statistics Counter. Counts the total number of PHY terminated packet. The

Offset	Register Name	Access	Description
0x050	TX_STAT_ERR_1	RO	tx_statvec_o[24] is used to implement this counter.
0x054	TX_STAT_UNDER_RUN_0	RO	Transmit Underrun Error Statistics Counter. Counts the total number of underrun packets transmitted. tx_statvec_o[21] is used to implement this counter.
0x058	TX_STAT_UNDER_RUN_1	RO	
0x05C	TX_STAT_CRC_ERR_0	RO	Transmit CRC Error Statistics Counter. Counts the total number of packets transmitted with CRC error. tx_statvec_o[22] is used to implement this counter.
0x060	TX_STAT_CRC_ERR_1	RO	
0x064	TX_STAT_LNGTH_ERR_0	RO	Transmit Length Error Statistics Counter. Counts the total number of packets transmitted with length of the packet and length in the Length/Type field mismatch. tx_statvec_o[23] is used to implement this counter.
0x068	TX_STAT_LNGTH_ERR_1	RO	
0x06C	TX_STAT_LNG_PKT_0	RO	Transmit Long packet Statistics Counter. Counts the total number of packets transmitted with length of the packet longer than the max_frm_size. tx_statvec_o[25] is used to implement this counter.
0x070	TX_STAT_LNG_PKT_1	RO	
0x074	TX_STAT_MULTCST_0	RO	Transmit Multicast Packet Statistics Counter. Counts the total number of multicast packets transmitted. tx_statvec_o[20] is used to implement this counter.
0x078	TX_STAT_MULTCST_1	RO	
0x07C	TX_STAT_BRDCST_0	RO	Transmit Broadcast Packet Statistics Counter. Counts the total number of broadcast packets transmitted. tx_statvec_o[19] is used to implement this counter.
0x080	TX_STAT_BRDCST_1	RO	
0x084	TX_STAT_CNT_0	RO	Transmit Control Packet Statistics Counter. Counts the total number of control packets (pause frame) transmitted by the AXI4-Stream interface. tx_statvec_o[16] is used to implement this counter.
0x088	TX_STAT_CNT_1	RO	
0x08C	TX_STAT_JMBO_0	RO	Transmit Jumbo Packet Statistics Counter. Counts the total number of jumbo packets transmitted. tx_statvec_o[17] is used to implement this counter.
0x090	TX_STAT_JMBO_1	RO	
0x094	TX_STAT_PAUSE_0	RO	Transmit Pause Packet Statistics Counter. Counts the total number of pause packets inserted by the MAC core (enabled through MAC_CTL register). tx_statvec_o[15] is used to implement this counter.
0x098	TX_STAT_PAUSE_1	RO	
0x09C	TX_STAT_VLN_TG_0	RO	Transmit VLAN Tag Statistics Counter. Counts the total number of tagged packets transmitted. tx_statvec_o[18] is used to implement this counter.
0x0A0	TX_STAT_VLN_TG_1	RO	
0x0A4	TX_STAT_PKT_OK_0	RO	Transmit Packet OK Statistics Counter. Counts the total number of packets transmitted without any errors. tx_statvec_o[14] is used to implement this counter.
0x0A8	TX_STAT_PKT_OK_1	RO	
0x0AC	TX_STAT_PKT_64_0	RO	Transmit Packet 64 Statistics Counter. Counts the total number of packets transmitted with length equal to 64.
0x0B0	TX_STAT_PKT_64_1	RO	
0x0B4	TX_STAT_PKT_65_127_0	RO	Transmit Packet 65 - 127 Statistics Counter. Counts the total number of packets transmitted with lengths

Offset	Register Name	Access	Description
0x0B8	TX_STAT_PKT_65_127_1	RO	between 65 and 127.
0x0BC	TX_STAT_PKT_128_255_0	RO	Transmit Packet 128-255 Statistics Counter. Counts the total number of packets transmitted with lengths between 128 and 255.
0x0C0	TX_STAT_PKT_128_255_1	RO	
0x0C4	TX_STAT_PKT_256_511_0	RO	Transmit Packet 256-511 Statistics Counter. Counts the total number of packets transmitted with lengths between 256 and 511.
0x0C8	TX_STAT_PKT_256_511_1	RO	
0x0CC	TX_STAT_PKT_512_1023_0	RO	Transmit Packet 512-1023 Statistics Counter. Counts the total number of packets transmitted with lengths between 512 and 1,023.
0x0D0	TX_STAT_PKT_512_1023_1	RO	
0x0D4	TX_STAT_PKT_1024_1518_0	RO	Transmit Packet 1024-1518 Statistics Counter. Counts the total number of packets transmitted with lengths between 1,024 and 1,518.
0x0D8	TX_STAT_PKT_1024_1518_1	RO	
0x0DC	TX_STAT_PKT_1518_0	RO	Transmit Packet 1518 Statistics Counter. Counts the total number of packets transmitted with length greater than 1,518.
0x0E0	TX_STAT_PKT_1518_1	RO	
0x0E4	TX_STAT_FRM_ERR_0	RO	Transmit Frame Error Statistics Counter. Counts the total number of packets transmitted with error. tx_statvec_o[14] is used to implement this counter.
0x0E8	TX_STAT_FRM_ERR_1	RO	
0x0EC	TX_STAT_PKT_1519_2047_0	RO	Transmit Packet 1519-2047 Statistics Counter. Counts the total number of packets transmitted with lengths between 1,024 and 2,047.
0x0F0	TX_STAT_PKT_1519_2047_1	RO	
0x0F4	TX_STAT_PKT_2048_4095_0	RO	Transmit Packet 2048-4095 Statistics Counter. Counts the total number of packets transmitted with lengths between 2,048 and 4,095.
0x0F8	TX_STAT_PKT_2048_4095_1	RO	
0x0FC	TX_STAT_PKT_4096_9216_0	RO	Transmit Packet 4096-9216 Statistics Counter. Counts the total number of packets transmitted with lengths between 4,096 and 9,216.
0x100	TX_STAT_PKT_4096_9216_1	RO	
0x104	TX_STAT_PKT_9217_16383_0	RO	Transmit Packet 9217-16383 Statistics Counter. Counts the total number of packets transmitted with lengths between 9,217 and 16,383.
0x108	TX_STAT_PKT_9217_16383_1	RO	
0x10C	RX_STAT_PKT_LNGTH_0	RO	Receive Packet Length Statistics Counter. Indicated the length of the packet received. rx_statvec_o[13:0] is used to implement this counter.
0x110	RX_STAT_PKT_LNGTH_1	RO	
0x114	RX_STAT_VLN_TG_0	RO	Receive VLAN Tag Statistics Counter. Counts the total number of tagged packets received. rx_statvec_o[18] is used to implement this counter.
0x118	RX_STAT_VLN_TG_1	RO	
0x11C	RX_STAT_PAUSE_0	RO	Receive Pause Packet Statistics Counter. Counts the total number of pause packets received.

Offset	Register Name	Access	Description
0x120	RX_STAT_PAUSE_1	RO	rx_statvec_o[19] is used to implement this counter.
0x124	RX_STAT_FLT_0	RO	Receive Filtered Packet Statistics Counter. rx_statvec_o[22] is used to implement this counter.
0x128	RX_STAT_FLT_1	RO	
0x12C	RX_STAT_UNSP_OPCODE_0	RO	Receive Unsupported Opcode Statistics Counter. Counts the number of packets received with unsupported Opcode. rx_statvec_o[23] is used to implement this counter.
0x130	RX_STAT_UNSP_OPCODE_1	RO	
0x134	RX_STAT_BRDCST_0	RO	Receive Broadcast Packet Statistics Counter. Counts the number of packets received that were directed to the broadcast address. This does not include multicast packets. rx_statvec_o[15] is used to implement this counter.
0x138	RX_STAT_BRDCST_1	RO	
0x13C	RX_STAT_MULTCST_0	RO	Receive Multicast Packet Statistics Counter. Counts the number of packets received that were directed to the multicast address. This does not include broadcast packets. rx_statvec_o[16] is used to implement this counter.
0x140	RX_STAT_MULTCST_1	RO	
0x144	RX_STAT_LNGTH_ERR_0	RO	Receive Length Error Statistics Counter. Counts the total number of packets received with length of the packet and length in the Length/Type field mismatch. rx_statvec_o[20] is used to implement this counter.
0x148	RX_STAT_LNGTH_ERR_1	RO	
0x14C	RX_STAT_LNG_PKT_0	RO	Receive Long Packet Statistics Counter. Counts the number of packets received longer than the max_pkt_len. rx_statvec_o[21] is used to implement this counter.
0x150	RX_STAT_LNG_PKT_1	RO	
0x154	RX_STAT_CRC_ERR_0	RO	Receive CRC Error Statistics Counter. Counts the number of packets received with CRC error. rx_statvec_o[17] is used to implement this counter.
0x158	RX_STAT_CRC_ERR_1	RO	
0x15C	RX_STAT_PKT_DISCARD_0	RO	Receive Packet Discard Statistics Counter. Counts the number of packets discarded at the receive end. rx_statvec_o[14] is used to implement this counter.
0x160	RX_STAT_PKT_DISCARD_1	RO	
0x164	RX_STAT_PKT_IGNORE_0	RO	Receive Packet Ignored Statistics Counter. Counts the number of packets ignored when you request using the ignore_pkt. rx_statvec_o[25] is used to implement this counter.
0x168	RX_STAT_PKT_IGNORE_1	RO	
0x16C	RX_STAT_PKT_FRAGMENTS_0	RO	Receive Packet Fragments Statistics Counter. Counts the number of packets received with less than 64 octets in length and has either an FCS error or an alignment error. rx_statvec_o[13:6] along with rx_statvec[17] are used to implement this counter.
0x170	RX_STAT_PKT_FRAGMENTS_1	RO	
0x174	RX_STAT_PKT_JABBERS_0	RO	Receive Packet Jabbers Statistics Counter. Counts the number of packets received with length longer than 1,518 octets and has either an FCS error or an alignment error. rx_statvec_o[13:0] along with rx_statvec_o[17] are used to implement this counter.
0x178	RX_STAT_PKT_JABBERS_1	RO	
0x17C	RX_STAT_PKT_64_0	RO	Receive Packet 64 Statistics Counter. Counts the number of packets received that were 64 octets in

Offset	Register Name	Access	Description
0x180	RX_STAT_PKT_64_1	RO	length (including bad packets). rx_statvec_o[13:0] is used to implement this counter.
0x184	RX_STAT_PKT_65_127_0	RO	Receive Packet 65-127 Statistics Counter. Counts the number of packets received that were between 65-127 octets in length (including bad packets).
0x188	RX_STAT_PKT_65_127_1	RO	
0x18C	RX_STAT_PKT_128_255_0	RO	Receive Packet 128-255 Statistics Counter. Counts the number of packets received that were between 128-255 octets in length (including bad packets).
0x190	RX_STAT_PKT_128_255_1	RO	
0x194	RX_STAT_PKT_256_511_0	RO	Receive Packet 256-511 Statistics Counter. Counts the number of packets received that were between 256-511 octets in length (including bad packets).
0x198	RX_STAT_PKT_256_511_1	RO	
0x19C	RX_STAT_PKT_512_1023_0	RO	Receive Packet 512-1023 Statistics Counter. Counts the number of packets received that were between 512-1,023 octets in length (including bad packets).
0x1A0	RX_STAT_PKT_512_1023_1	RO	
0x1A4	RX_STAT_PKT_1024_1518_0	RO	Receive Packet 1024-1518 Statistics Counter. Counts the number of packets received that were between 1,024-1,518 octets in length (including bad packets).
0x1A8	RX_STAT_PKT_1024_1518_1	RO	
0x1AC	RX_STAT_PKT_UNDERSIZE_0	RO	Receive Packet Undersize Statistics Counter. Counts the number of packets received that were less than 64 octets long and were otherwise well formed.
0x1B0	RX_STAT_PKT_UNDERSIZE_1	RO	
0x1B4	RX_STAT_PKT_UNICAST_0	RO	Receive Packet Unicast Statistics Counter. Counts the number of good packets received that were directed to a single address.
0x1B8	RX_STAT_PKT_UNICAST_1	RO	
0x1BC	RX_STAT_PKT_RCVD_0	RO	Packets Received Statistics Counter. Counts the number of packets received (including bad packet, broadcast, and multicast packets). rx_statvec[15] and rx_statvec_o[16] are used to implement this counter.
0x1C0	RX_STAT_PKT_RCVD_1	RO	
0x1C4	RX_STAT_PKT_64_GOOD_CRC_0	RO	Receive Packet 64 with Good CRC Statistics Counter. Counts the number of packets received with length less than 64 and with a good CRC. rx_statvec_o[13:6] and rx_statvec_o[17] are used to implement this counter.
0x1C8	RX_STAT_PKT_64_GOOD_CRC_1	RO	
0x1CC	RX_STAT_PKT_1518_GOOD_CRC_0	RO	Receive Packet 1518 with Good CRC Statistics Counter. Counts the number of packets received with length more than 1,518 and with a good CRC. rx_statvec_o[13:0] and rx_statvec_o[17] are used to implement this counter.
0x1D0	RX_STAT_PKT_1518_GOOD_CRC_1	RO	
0x1D4	RX_STAT_PKT_1519_2047_0	RO	Receive Packet 1519-2047 Statistics Counter. Counts the number of packets received that were between 1,519 - 2,047 octets in length (including bad packets).
0x1D8	RX_STAT_PKT_1519_2047_1	RO	
0x1DC	RX_STAT_PKT_2048_4095_0	RO	Receive Packet 2048-4095 Statistics Counter. Counts the number of packets received that were between 2,048 – 4,095 octets in length (including bad packets).
0x1E0	RX_STAT_PKT_2048_4095_1	RO	

Offset	Register Name	Access	Description
0x1E4	RX_STAT_PKT_4096_9216_0	RO	Receive Packet 4096-9216 Statistics Counter. Counts the number of packets received that were between 4,096 – 9,216 octets in length (including bad packets).
0x1E8	RX_STAT_PKT_4096_9216_1	RO	
0x1EC	RX_STAT_PKT_9217_16383_0	RO	Receive Packet 9217-16383 Statistics Counter. Counts the number of packets received that were between 9,217 – 16,383 octets in length (including bad packets).
0x1F0	RX_STAT_PKT_9217_16383_1	RO	
0x204	TX_STAT_PTP1588_PKT_0	RO	Transmit PTP1588 Statistics Counter. Counts the number of PTP1588 packets transmitted. The tx_statvec_o[26] is used to implement this counter.
0x208	TX_STAT_PTP1588_PKT_1	RO	
0x20C	RX_STAT_PTP1588_PKT_0	RO	Receive PTP1588 Statistics Counter. Counts the number of PTP1588 packets received. The rx_statvec_o[26] is used to implement this counter.
0x210	RX_STAT_PTP1588_PKT_1	RO	
0x21C	RX_STAT_LINK_OK	RO	<p>Receive link_ok Statistics Counter. Counts the number of link_ok bit received.</p> <p>Note: If you wish to use the RX link_ok statistics counter, you cannot reset the MAC signals, such as xg_rxval_o and xg_rx_blk_lock_o signals when the RX PHY is down.</p>
0x224	TX_STAT_PKT_LENGTH_ACCU_0	RO	Transmit Accumulation Byte Statistic Counter. Count and accumulate the total packet length that will receive from AXIS interface and transmits to GMII interface. The counter will rollover to 0 if full.
0x228	TX_STAT_PKT_LENGTH_ACCU_1	RO	
0x22C	RX_STAT_PKT_LENGTH_ACCU_0	RO	Receive Accumulation Byte Statistic Counter. Count and accumulate the total packet length that is received from GMII interface and transmitted to AXIS interface. The counter will not increase if the packet received is discarded by MAC. The counter will rollover to 0 if full.
0x230	RX_STAT_PKT_LENGTH_ACCU_1	RO	

## 5.4. PHY Registers (CertusPro-NX Devices)

This section provides detailed descriptions of 2.5G Ethernet PCS data registers.

The following register address map specifies the available IP core registers.

For register information, refer to the [CertusPro-NX SerDes/PCS User Guide \(FPGA-TN-02245\)](#).

**Table 5.19. Register Address Map for PHY (CertusPro-NX Devices)**

APB Offset	Register Name	Bit Width	Description
0x7804	MMD1 Device Identifier 0	16	Refer to IEEE 802.3 Clause 45.2.
0x7805	MMD1 Device Identifier 1	16	Refer to IEEE 802.3 Clause 45.2.
0x780A	MMD1 Devices in Package 0	16	Refer to IEEE 802.3 Clause 45.2.
0x780B	MMD1 Devices in Package 1	16	Refer to IEEE 802.3 Clause 45.2.
0x7810	MMD1 Status Register	16	Refer to IEEE 802.3 Clause 45.2.
0x781C	MMD1 Package Identifier 0	16	Refer to IEEE 802.3 Clause 45.2.
0x781D	MMD1 Package Identifier 1	16	Refer to IEEE 802.3 Clause 45.2.
0x7A00 – 0x7AFF	PMA Registers	16	Refer to the Appendix A section of the <a href="#">CertusPro-NX SerDes/PCS User Guide (FPGA-TN-02245)</a> .

APB Offset	Register Name	Bit Width	Description
0x7B00 – 0x7BEA	MPCS Module Registers	16	Refer to the <a href="#">Multi-Protocol PCS Module User Guide (FPGA-IPUG-02118)</a> .

The behavior of registers to write and read access is defined by its access type, which is defined in the following table.

**Table 5.20. Access Type Definition**

Access Type	Behavior on Read Access	Behavior on Write Access
RO	Returns register value	Ignores write access
RW	Returns register value	Updates register value
RSVD (Applicable to MMD registers only)	Ignore when read	Ignores write access

### 5.4.1. MMD1 Device Identifier 0

mmd1\_dv\_id\_0—Provides the upper 16-bit value, which constitutes a unique identifier for a particular type of vendor-specific device. For more information regarding this register, see IEEE 802.3 Clause 45.2 Table 45-1.

**Table 5.21. MMD1 Device Identifier 0**

Field	Name	Access	Width	Reset
[15:0]	mmd1_dv_id_0	RO	16	16'h0

### 5.4.2. MMD1 Device Identifier 1

mmd1\_dv\_id\_1—Provides the lower 16-bit value, which constitutes a unique identifier for a particular type of vendor-specific device. For more information regarding this register, see IEEE 802.3 Clause 45.2 Table 45-1.

**Table 5.22. MMD1 Device Identifier 1**

Field	Name	Access	Width	Reset
[15:0]	mmd1_dv_id_1	RO	16	16'h3

### 5.4.3. MMD1 Devices in Package 0

mmd1\_dv\_pkg\_0—Provides the lower 16-bit value, each bit read as one indicates which MMDs are instantiated within the same package as the MMD being accessed. PMA and PCS are bit 1 and bit 3 of this register, respectively; hence, the reset value is 16'h000A. For more details regarding this register, see IEEE 802.3 Clause 45.2 Table 45-2.

**Table 5.23. MMD1 Devices in Package 0**

Field	Name	Access	Width	Reset
[15:0]	mmd1_dv_pkg_0	RO	16	16'hA

### 5.4.4. MMD1 Devices in Package 1

mmd1\_dv\_pkg\_1—Provides the upper 16-bit value, each bit read as one indicates which MMDs are instantiated within the same package as the MMD being accessed. For more details regarding this register, see IEEE 802.3 Clause 45.2 Table 45-2.

**Table 5.24. MMD1 Devices in Package 1**

Field	Name	Access	Width	Reset
[15:0]	mmd1_dv_pkg_1	RO	16	16'h0

### 5.4.5. MMD1 Status Register

mmd1\_stat\_reg—Specifies if the device is present and responding at this register address or not.

- 2'b10 – Device responding at this address.
- 2'b11 – No device responding at this address.
- 2'b01 – No device responding at this address.
- 2'b00 – No device responding at this address.

**Table 5.25. MMD1 Status Register**

Field	Name	Access	Width	Reset
[15:14]	mmd1_stat_reg	RO	2	2'h2
[13:0]	reserved	RSVD	14	14'h0

### 5.4.6. MMD1 Package Identifier 0

mmd1\_pkg\_id\_0—Provides the upper 16-bit value, which constitutes a unique identifier for a particular type of package instantiated within. The package identifier may be the same as the device identifier. For more information regarding this register, see IEEE 802.3 Clause 45.2 Table 45-1.

**Table 5.26. MMD1 Package Identifier 0**

Field	Name	Access	Width	Reset
[15:0]	mmd1_pkg_id_0	RO	16	16'h0

### 5.4.7. MMD1 Package Identifier 1

mmd1\_pkg\_id\_1— Provides the lower 16-bit value, which constitutes a unique identifier for a particular type of package instantiated within. The package identifier may be the same as the device identifier. For more information regarding this register, see IEEE 802.3 Clause 45.2 Table 45-1.

**Table 5.27. MMD1 Package Identifier 1**

Field	Name	Access	Width	Reset
[15:0]	mmd1_pkg_id_1	RO	16	16'h3

## 5.5. PHY Registers (Avant Devices)

This section provides detailed descriptions of 2.5G Ethernet PCS data registers.

The following register address map specifies the available IP core registers.

**Table 5.28. Access Types for PHY**

Access Type	Behavior on Read Access	Behavior on Write Access
RO	Returns register value	Ignores write access.
WO	Returns 0	Updates register value.
RW	Returns register value	Updates register value.
RW1C	Returns register value	Writing 1'b1 on register bit clears the bit to 1'b0. Writing 1'b0 on register bit is ignored.
Reserved	Returns 0	Ignores write access.

### 5.5.1. Configuration Registers for PHY

The following table shows the register address map for the 2.5GbE PHY IP core.

**Table 5.29. Register Address Map for PHY**

AXI4-Lite Offset	APB Offset	Register Name	Bit Width	Description
<b>PCS Registers</b>				
0xA000 – 0xA0FC	0x5000 – 0x507F	PCS Module Registers	16	Refer to the <a href="#">Lattice Avant SERDES/PCS User Guide (FPGA-TN-02313)</a> .

For more information on the address mapping, refer to the [PHY Management Block \(Avant Device\)](#) section.

## 6. Example Design

The 2.5G Ethernet IP example design allows you to compile, simulate, and test the IP on the following Lattice evaluation board:

- CertusPro-NX Evaluation Board
- Avant G/X Versa board

For more information, refer to the [CertusPro-NX Evaluation Board User Guide \(FPGA-EB-02046\)](#) and [Avant G/X Versa Board User Guide \(FPGA-EB-02063\)](#).

### 6.1. Example Design Supported Configuration

This section describes how to use the 2.5G Ethernet IP with the following example designs.

#### 6.1.1. CertusPro-NX Evaluation Board with SMA Cable Serial Loopback Setup

**Note:** In the table below, ✓ refers to a checked option in the 2.5G Ethernet IP example design.

**Table 6.1. 2.5G Ethernet IP Configuration Supported by the Example Design**

IP GUI Parameter	IP Configuration
Select IP Option	MAC + PHY
Loopback Mode	Disabled
MAC Configuration:	
• Multicast Address Filtering	—
• TX Pause Frame Generation via Ports	—
Statistics Counter Configuration:	
• Statistics Counter Registers	—
PMA Setup-Receiver Subgroup	—
RX Adaptive Equalization:	✓
• Gen1 Enable	RL2plus
• Gen1: Adaptive Algorithm	—
• Gen2: Enable	—
• Gen3: Enable	—
• Gen1/2: Preliminary Adaptive EQ	Enabled
• Gen1/2: Training phase Adaptive EQ	Enabled
• Gen1/2: Post-phase Adaptive EQ	Enabled
PHY Configuration:	
• PCS Lane ID	0

#### 6.1.2. Avant G/X Versa Board with SFP+ Serial Loopback Setup

**Note:** In the table below, ✓ refers to a checked option in the 2.5G Ethernet IP example design.

**Table 6.2. 2.5G Ethernet IP Configuration Supported by the Example Design**

IP GUI Parameter	IP Configuration
Select IP Option	MAC + PHY
Host Interface	APB
MAC Configuration:	
• Multicast Address Filtering	—
• TX Pause Frame Generation via Ports	—
Statistics Counter Configuration:	
• Statistics Counter Registers	—

IP GUI Parameter	IP Configuration
PMA Setup-Receiver Subgroup	—
RX Adaptive Equalization:	✓
• Gen1 Enable	RL2plus
• Gen1: Adaptive Algorithm	—
• Gen2: Enable	—
• Gen3: Enable	Enabled
• Gen1/2: Preliminary Adaptive EQ	Enabled
• Gen1/2: Training phase Adaptive EQ	Enabled
• Gen1/2: Post-phase Adaptive EQ	Enabled
PHY Configuration:	
• PCS Lane ID	24
• Fast Mode	—
• Loopback Mode	Disabled

## 6.2. Overview of Example Design and Features

This section describes how to use the 2.5G Ethernet IP example design on CertusPro-NX Evaluation Board or Avant Versa Board .

The key features of the example design include:

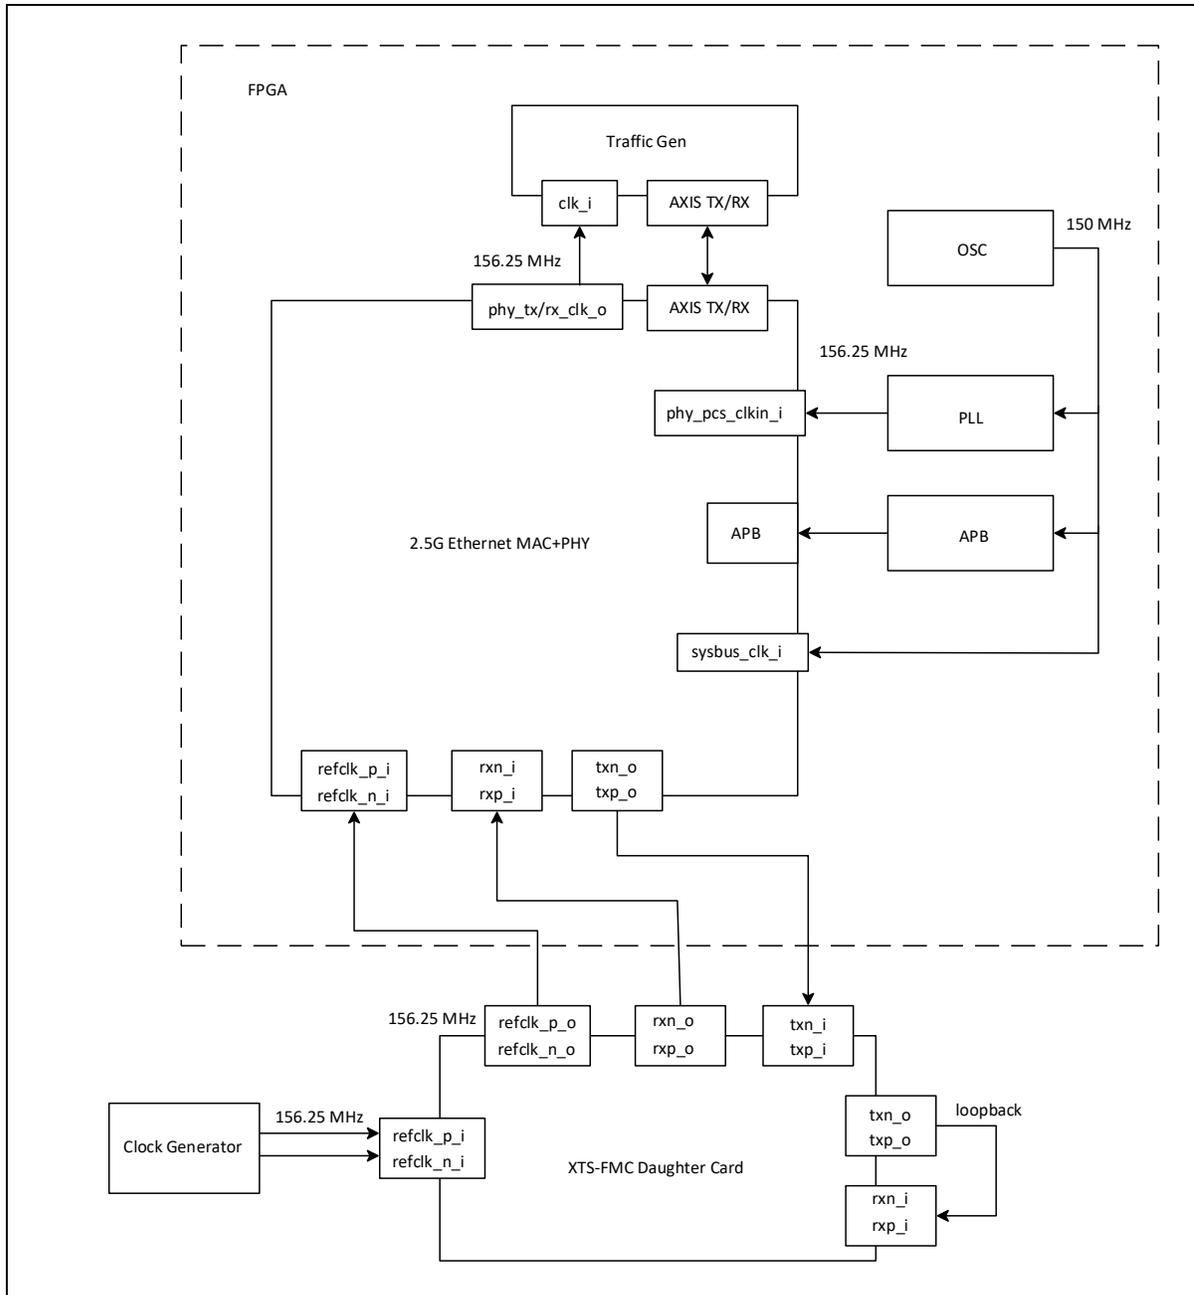

- APB module that configures MAC to enable transmit and receive datapath.
- Packet generator on transmit datapath.
- Packet checker on receive datapath to check loopback packets or traffic.

## 6.3. Example Design Components

The following figure shows the block diagram of the example design for different boards.

### 6.3.1. Hardware Example Design for CertusPro-NX Evaluation Board

The example design features the 2.5G Ethernet IP along with all the components. The FMC daughtercard is connected to the CertusPro-NX Evaluation Board for external reference clock and serial data loopback. The external reference clock used in this example design is sourced from a clock generator. For example, a CG635 clock generator that supplies 156.25 MHz LVDS clock.

**Figure 6.1. 2.5G MAC + PHY Hardware Example Design Block Diagram—CertusPro-NX Evaluation Board**

The 2.5G Ethernet example design includes the following blocks:

- 2.5G Ethernet MAC + PHY IP
- PLL
- OSC
- APB
- Traffic\_gen
- XTS-FMC daughter card

### 6.3.2. Hardware Example Design for Avant Versa Board

The example design features the 2.5G Ethernet IP along with all the components. The 10G SFP+ Loopback module is connected to the Avant Versa Board for serial data loopback. It loops back the electrical signal from the transmit (TX) pins to the receive (RX) pins.

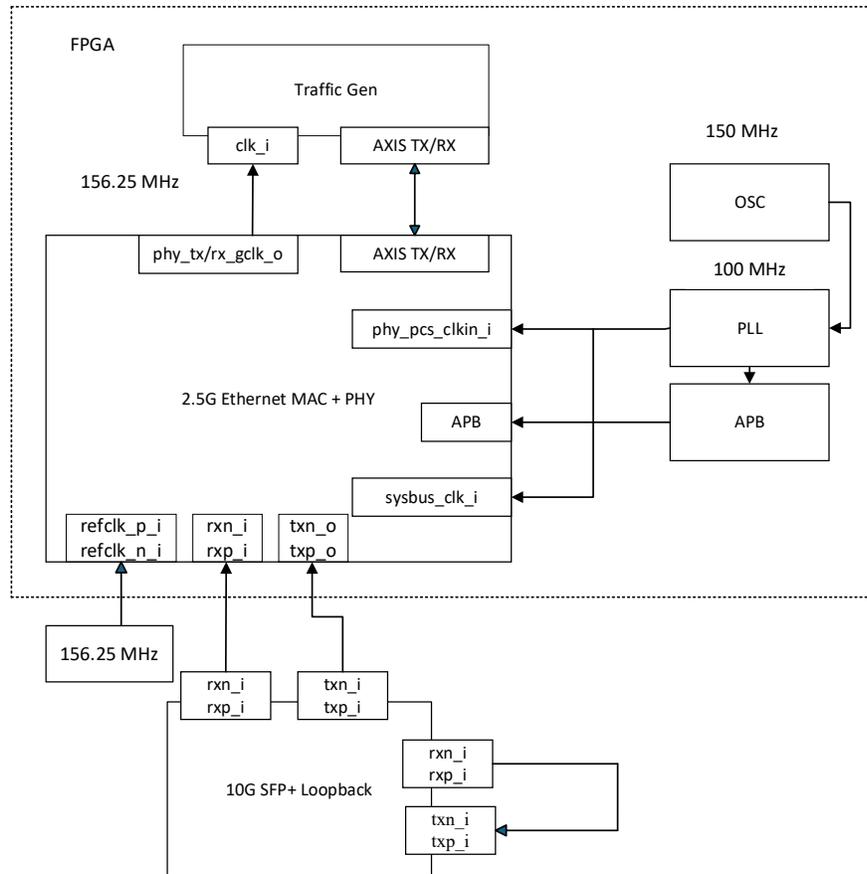

Figure 6.2. 2.5G MAC + PHY Hardware Example Design Block Diagram—Avant Versa Board

The 2.5G Ethernet example design includes the following blocks:

- 2.5G Ethernet MAC+PHY IP
- OSC
- APB
- Traffic\_gen
- 10G SFP+ Loopback module

### 6.3.3. 2.5G Ethernet MAC+PHY IP Hardware Example Design Components

The 2.5G Ethernet IP core contains all the necessary logic, interfacing, and clocking infrastructure ready to integrate with any system efficiently. It supports the ability to transmit and receive data between standard interfaces, such as APB and AXI4-Stream.

#### 6.3.3.1. PLL

The phase-locked loop (PLL) module is capable of frequency synthesis and clock phase management including clock injection delay cancellation. It has flexibility of input and feedback source selections, multiple output selections, and independent phase-shifting features. PLL is used to supply 100 MHz clock to sysbus\_clk\_i from 2.5G Ethernet IP, by sourcing the clock from OSC.

#### 6.3.3.2. OSC

The oscillator (OSC) module is designed to produce two clock signals that drive the FPGA clock tree for user-specific applications. The trimmed low-frequency oscillator and trimmed high-frequency oscillator are also used by the IP sub-system. The OSC is used to supply clock to PLL, APB, and sysbus\_clk\_i from 2.5G Ethernet IP.

#### 6.3.3.3. APB

The Advanced Peripheral Bus is the standard interface that the 2.5G Ethernet IP core uses to interface with the host. The APB is used to configure 2.5G Ethernet IP registers, TX enable, and RX enable.

#### 6.3.3.4. Traffic Gen

The Traffic Generator block module is an optional block that is used to generate continuous fixed length frame of size 1500, with pseudo random data for transmission using AXI4-Stream Transmit and Receive interface. This module has data checker included, which performs checking on the data received against the data transmitted.

#### 6.3.3.5. XTS-FMC Daughtercard

The XTS-FMC daughtercard is designed to convert FPGA transceiver channels to SMA connectors through an FPGA Mezzanine Card interface. For more information about the XTS-FMC Board, refer to the [XTS-FMC Board](#) web page. This module is only implemented in CertusPro-NX hardware example design.

#### 6.3.3.6. 10G SFP+ Loopback Module

The SFP+ Loopback modules provide an effective way of testing the SFP+ port in the host system by looping back the electrical signal (optics are excluded). This module is only implemented in the Avant Hardware Example Design.

## 6.4. Simulating the Example Design

### 6.4.1. Example Design Testbench

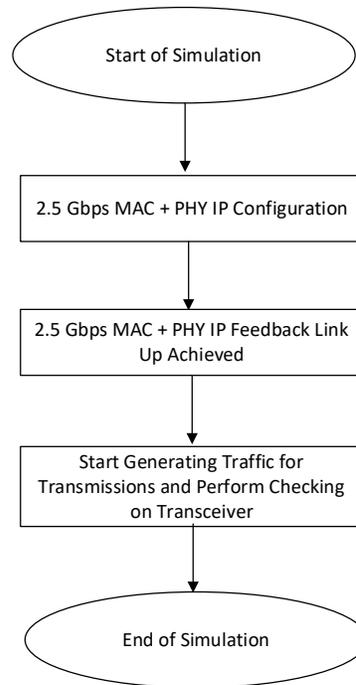

The 2.5G Ethernet IP example design comes with a testbench for simulating the versa top file, and *tb\_top.v*.

CertusPro-NX: eval/versa\_top/lfcpx\_2p5g\_macphy/

Avant: eval/versa\_top/avantx70\_2p5g\_macphy

### 6.4.2. Simulation Flow

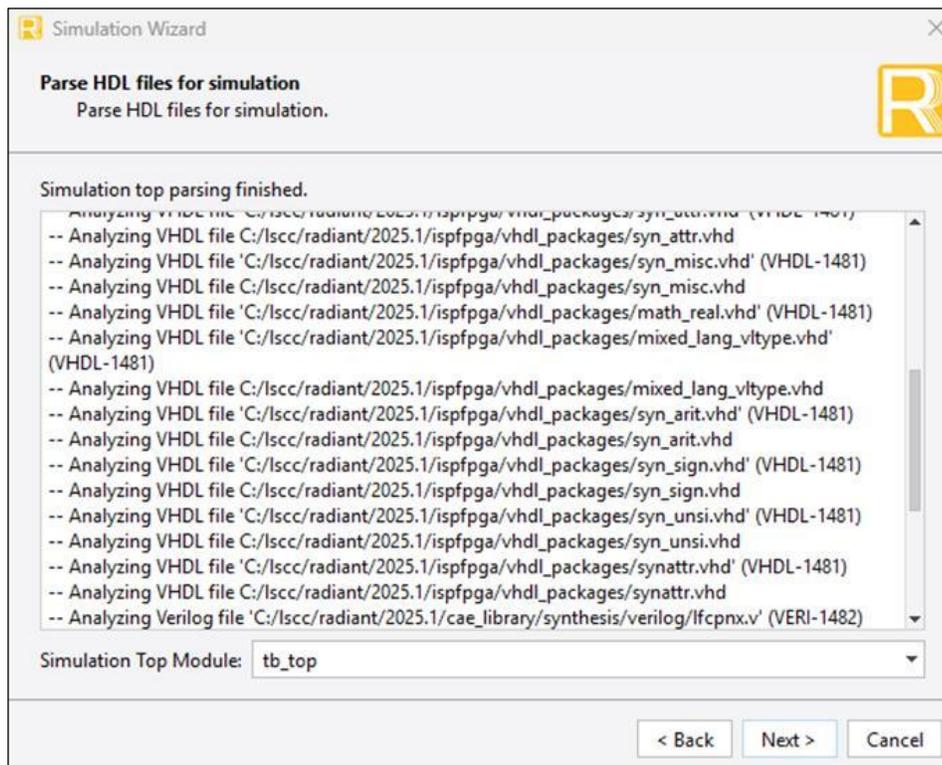

The following flow chart shows the simulation process from initializing 2.5G Ethernet IP and starting the traffic generators to showcasing the IP transmission and receiver performance.

**Figure 6.3. 2.5G Ethernet Example Design Flowchart**

To simulate the testbench, follow these steps:

1. Launch the Simulation Wizard from the Radiant software and follow the onscreen instructions. Select *tb\_top* as the simulation top module.

**Figure 6.4. Simulation Wizard Interface**

- After you have launched the QuestaSim software, load the macro file, *tb\_top.do* to load the preset signal for the simulation. You may need to restart the simulation after loading the preset signal.

The following figure shows the simulation results of the 2.5G Ethernet IP. The *compareFail* signal from the checker remains low throughout the test, showing all the data transmitted and received have passed the data checker test.

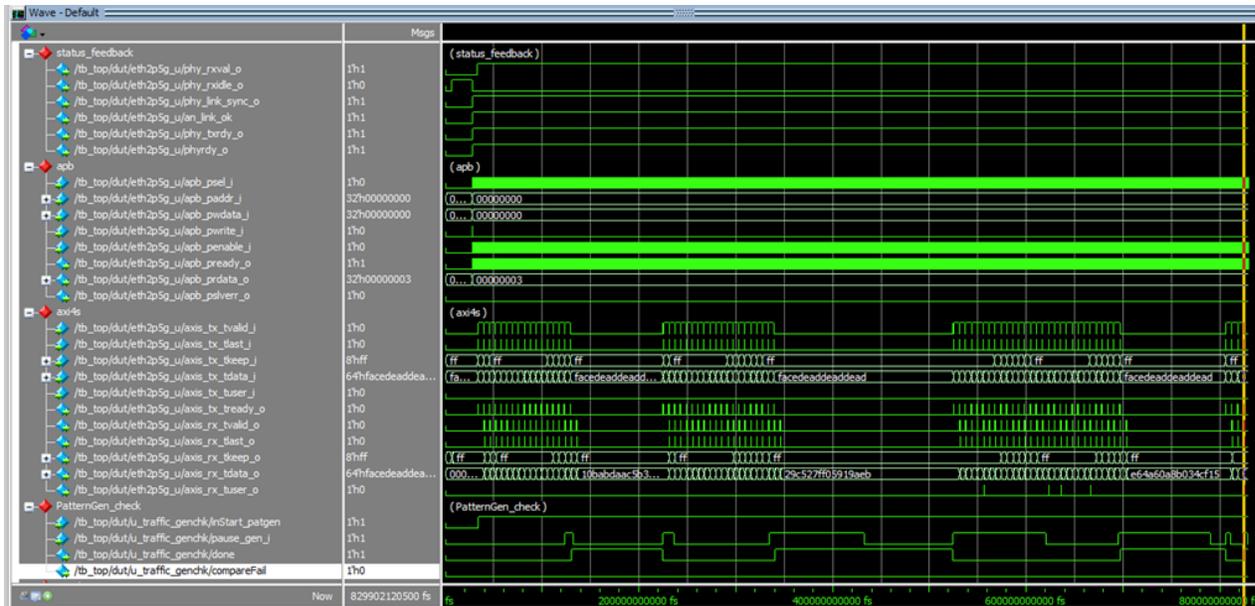

Figure 6.5. Overall Simulation Results for 2.5G Ethernet MAC+PHY

A successful test run displays the following behavior:

*phy\_link\_sync\_o* and *phy\_rxval\_o* signals are asserted from 2.5G MAC + PHY IP, indicating that the IP is ready for transmission.

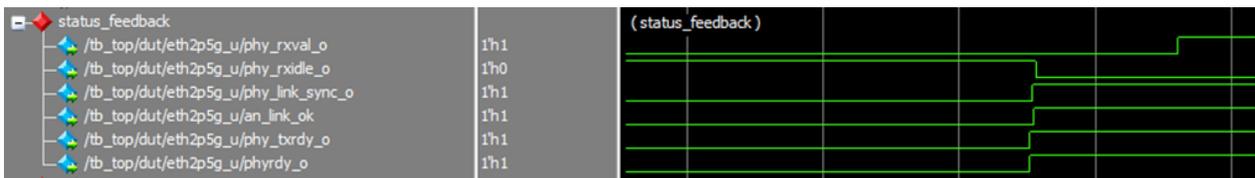

Figure 6.6. Simulation Results for 2.5G Link Status

- Start pattern generator by asserting *inStart\_patgen*, and AXI-S TX and RX are populated by data. If there is any data that fails the checker test, *compareFail* is asserted. Assertion of *pause\_gen\_i* is used to demonstrate pause and resume of data transmission.

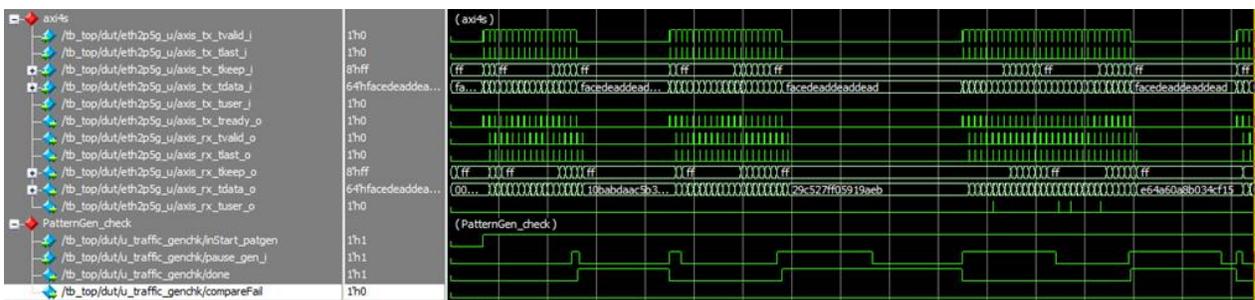

Figure 6.7. Simulation Results for Data Transmission

- At the end of the transmission, the transcript displays *End of Simulation* along with the result of the checker test, indicating either PASS or FAIL.

## 6.5. Hardware Testing

### 6.5.1. CertusPro-NX Evaluation Board Setup

The 2.5G Ethernet IP example design demonstrates serial loopback functionality using the CertusPro-NX Evaluation Board connected with an FMC daughtercard of the XTS-FMC Board by Terasic. In this example design, a 156.25 MHz LVDS clock rate is supplied from an external clock generator to the CertusPro-NX Evaluation Board through the XTS-FMC Board.

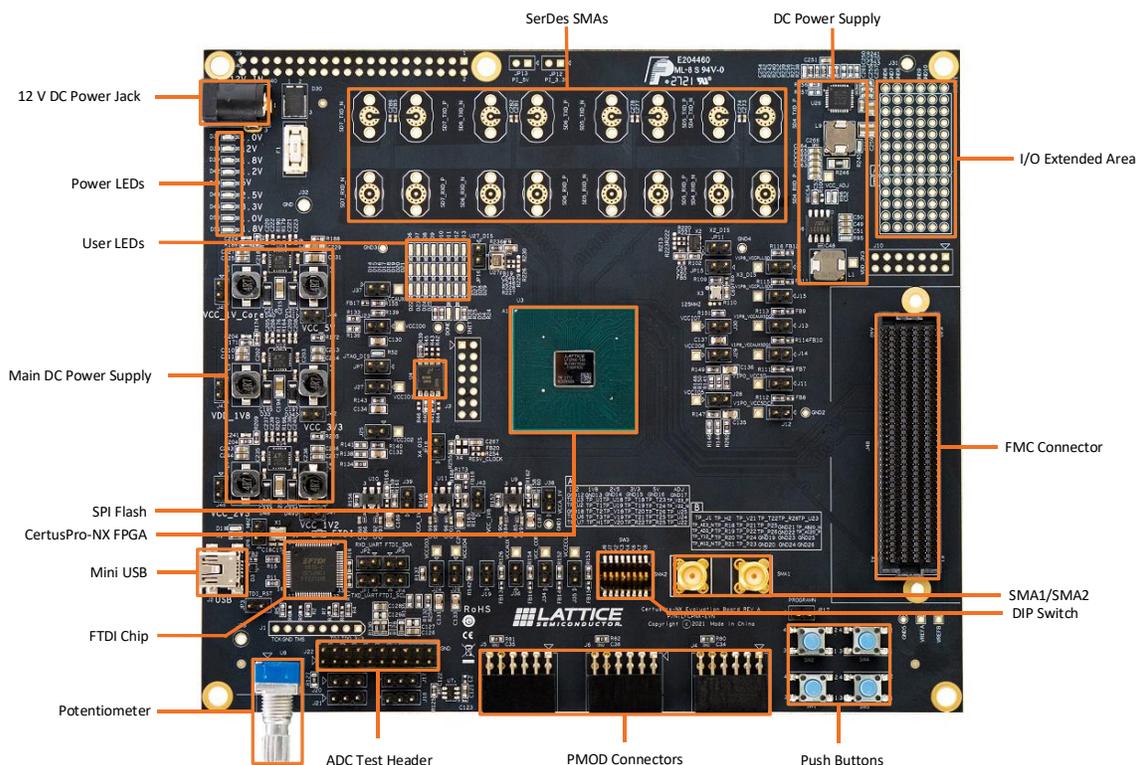

Figure 6.9. CertusPro-NX Evaluation Board

For more information on the CertusPro-NX Evaluation Board, refer to the [CertusPro-NX Evaluation Board User Guide \(FPGA-EB-02046\)](#).

For more information about the XTS-FMC Board, refer to the [XTS-FMC Board](#) web page.

## 6.5.2. Avant Versa Board Setup

The 2.5G Ethernet IP example design demonstrates serial loopback functionality using the Avant Versa Board connected with 10G SFP+ Loopback module.

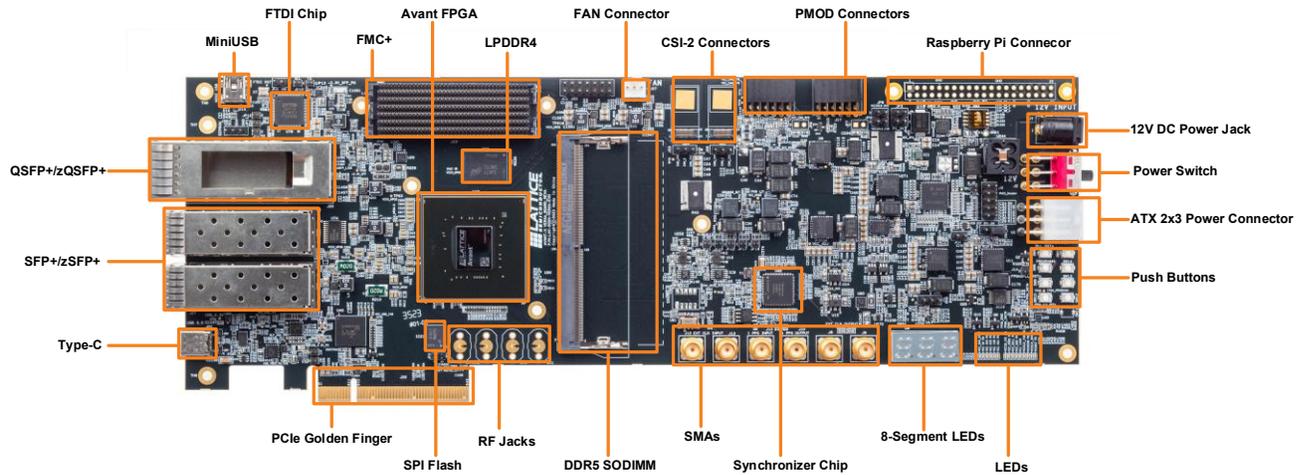

Figure 6.10. Avant Versa Board

For more information on the Avant Versa Evaluation Board, refer to the [Avant G/X Versa Board User Guide \(FPGA-EB-02063\)](#).

## 6.5.3. Using 2.5G Ethernet Example Design

### 6.5.3.1. Creating New Radiant Project

To create a new project, follow these steps:

1. In the Lattice Radiant software, go to **File -> New -> Project...** or click on the New Project icon.

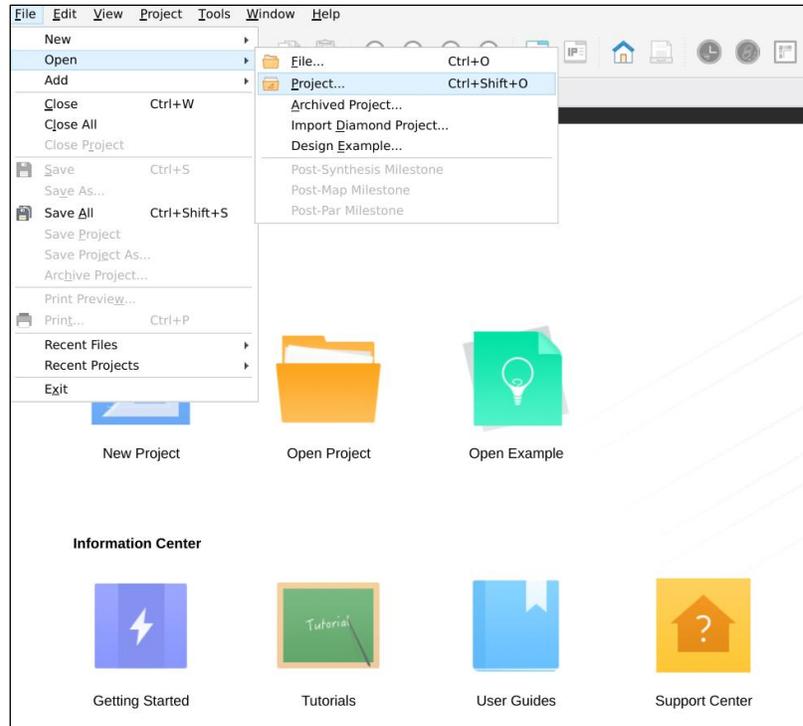

Figure 6.11. Project Creation

2. Specify Project Name, Location, Implementation Name, and click **Next**.

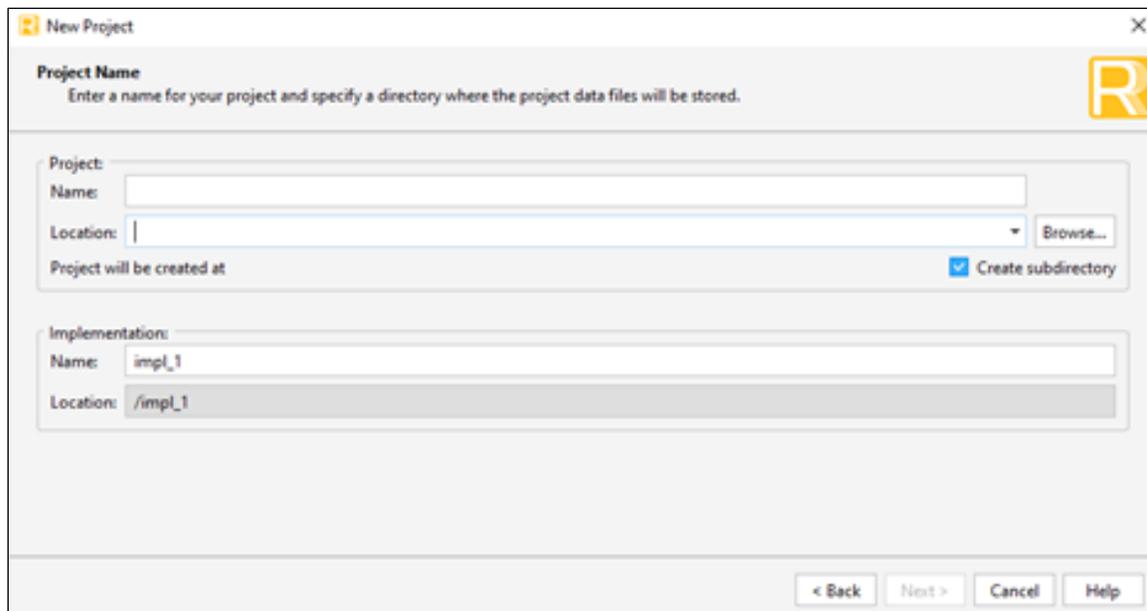

Figure 6.12. Project Name and Location

3. Specify a device for the project by selecting a device family, an operating condition, the package, performance grade, and part number.

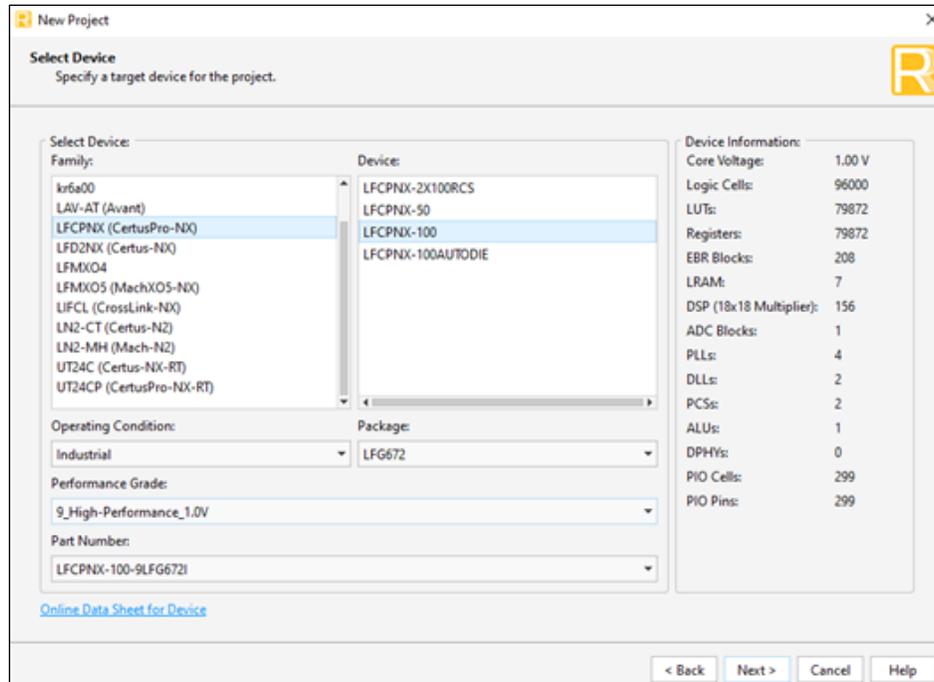

Figure 6.13. Select a CertusPro-NX Device

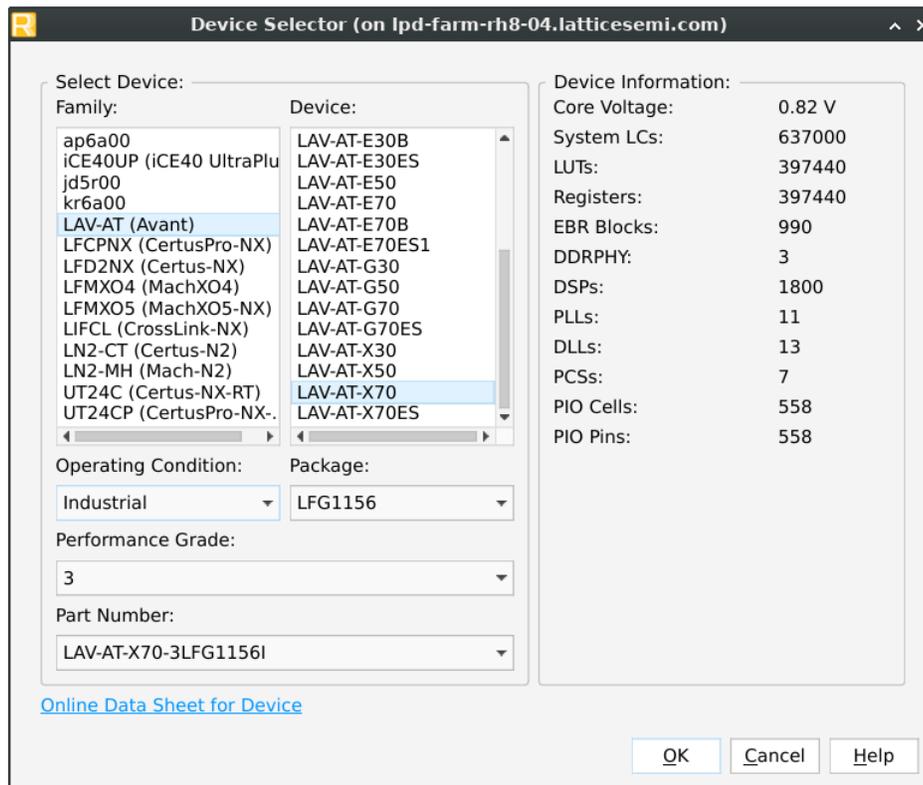

Figure 6.14. Select an Avant Device

4. Select a synthesis tool for the project.

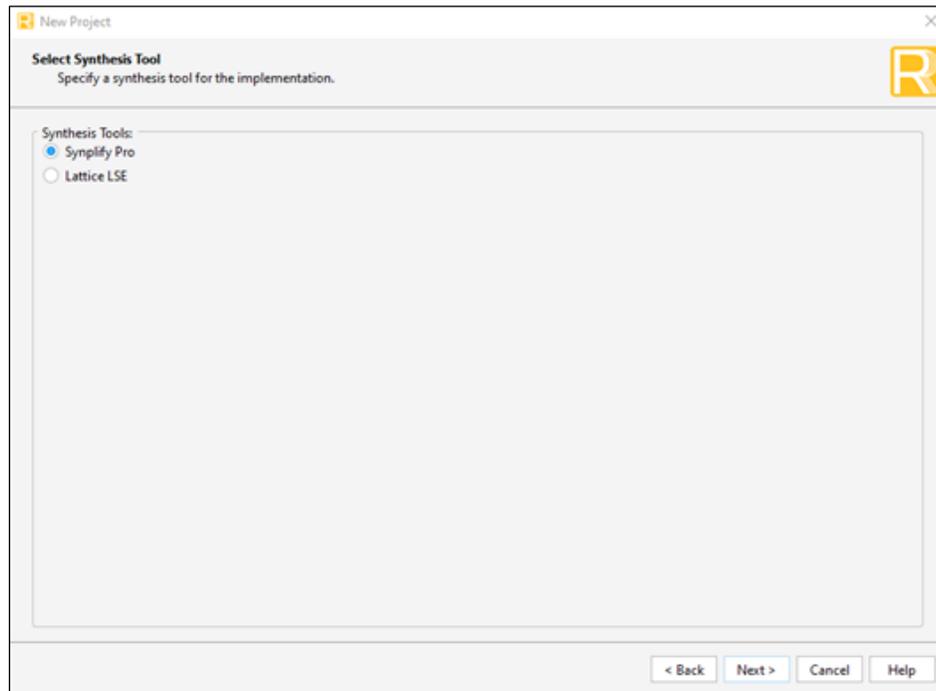

Figure 6.15. Project Synthesis Tool

5. View and verify the project information for the project creation.

#### 6.5.3.2. IP Installation and Generation

To install and generate the IP, follow these steps:

1. Go to **IP Catalog** -> **IP on Server** to download the IP.
2. After you download and install the IP from server, go to **IP on Local** -> **Generate...** to launch the IP generation wizard.

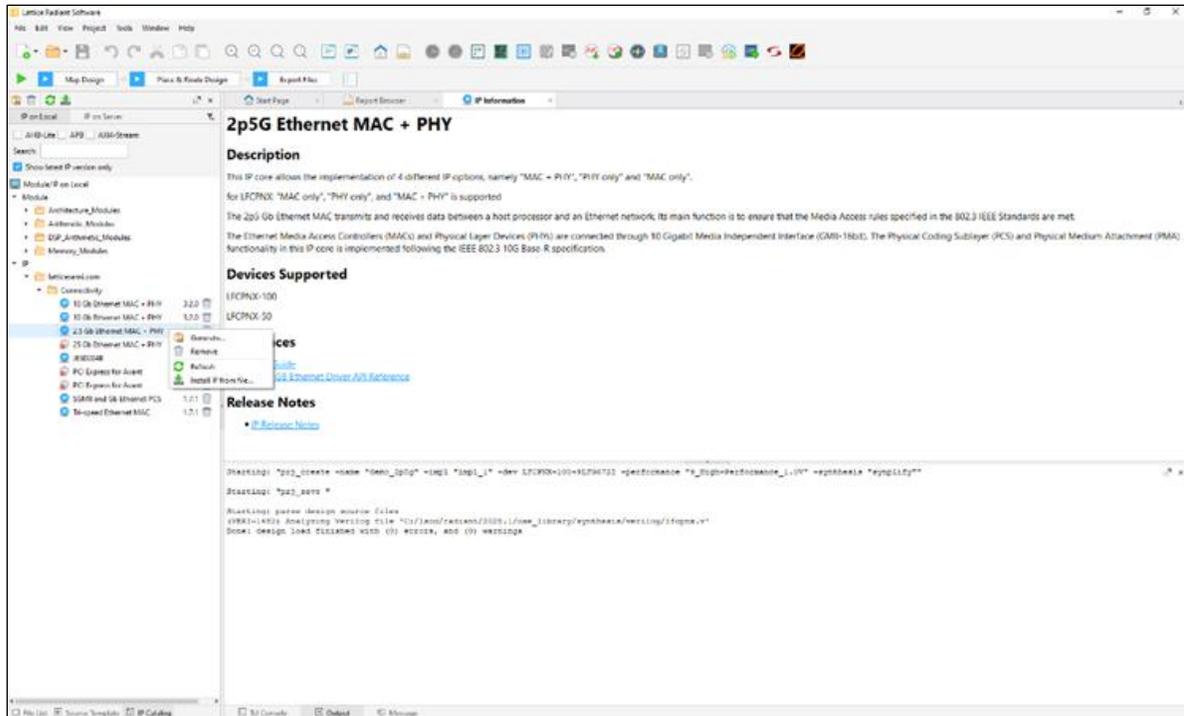

Figure 6.16. IP Catalog

3. Enter the component name and project directory for IP generation, and click **Next**.

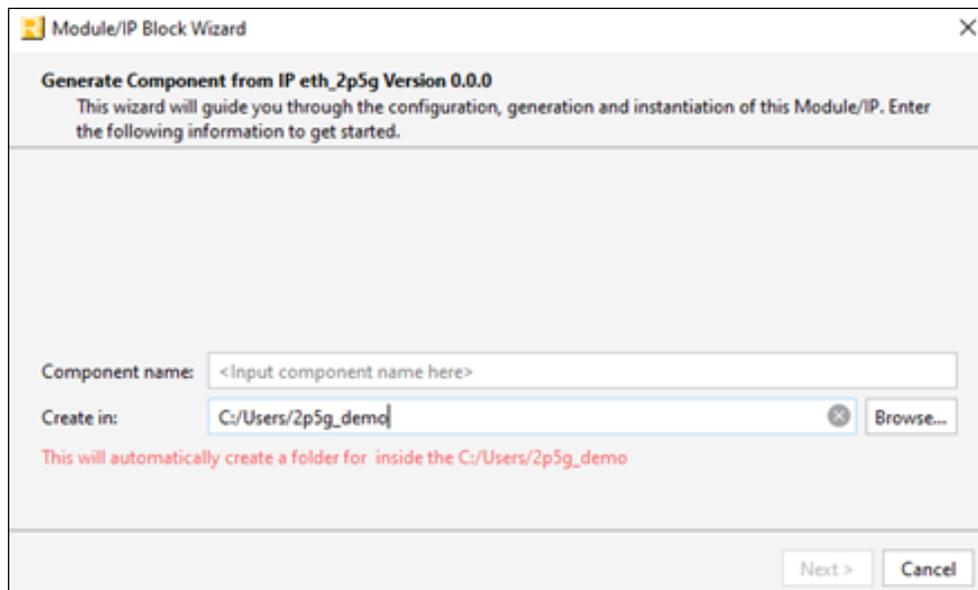

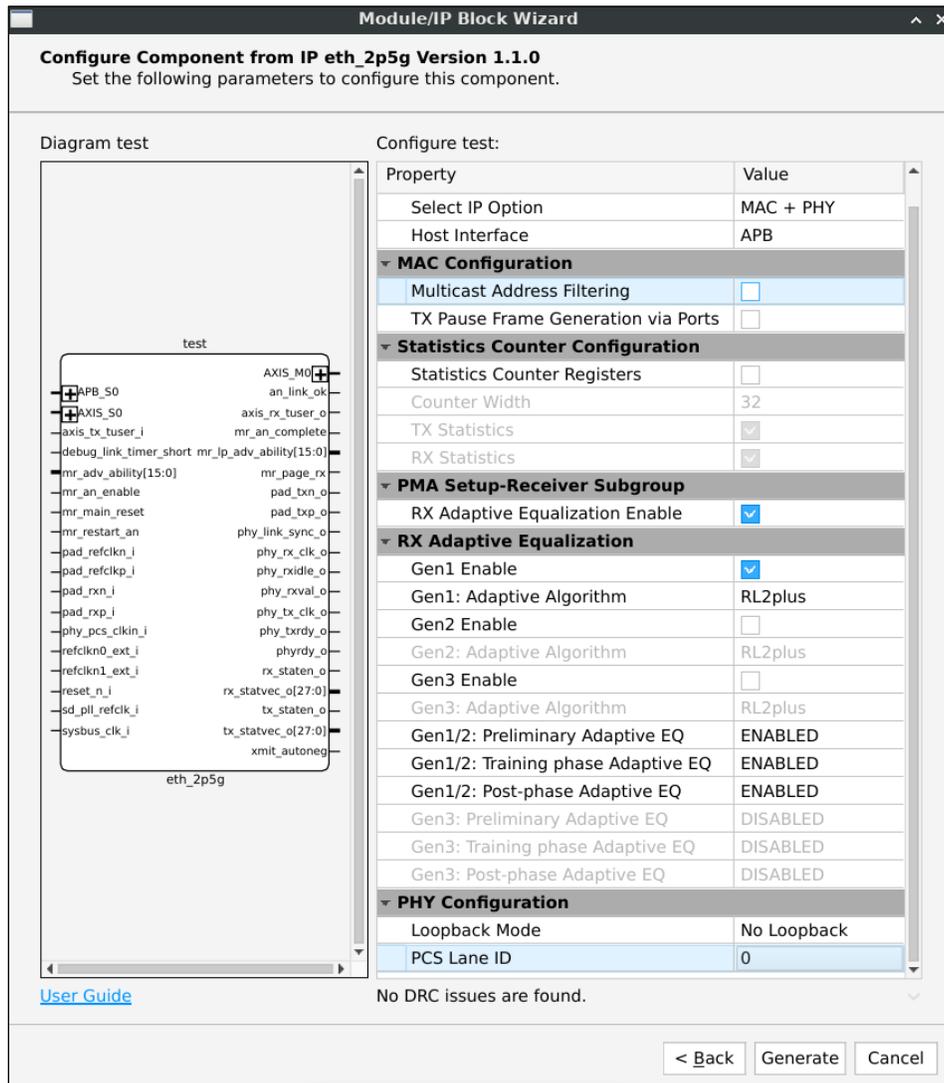

Figure 6.17. IP Component

4. Configure the IP interface, and click **Generate**.

**Configure Component from IP eth\_2p5g Version 1.1.0**  
Set the following parameters to configure this component.

**Diagram test**

**Configure test:**

Property	Value
Select IP Option	MAC + PHY
Host Interface	APB
<b>MAC Configuration</b>	
Multicast Address Filtering	<input type="checkbox"/>
TX Pause Frame Generation via Ports	<input type="checkbox"/>

**Figure 6.18. IP Component Configuration for CertusPro-NX Device–MAC+PHY**

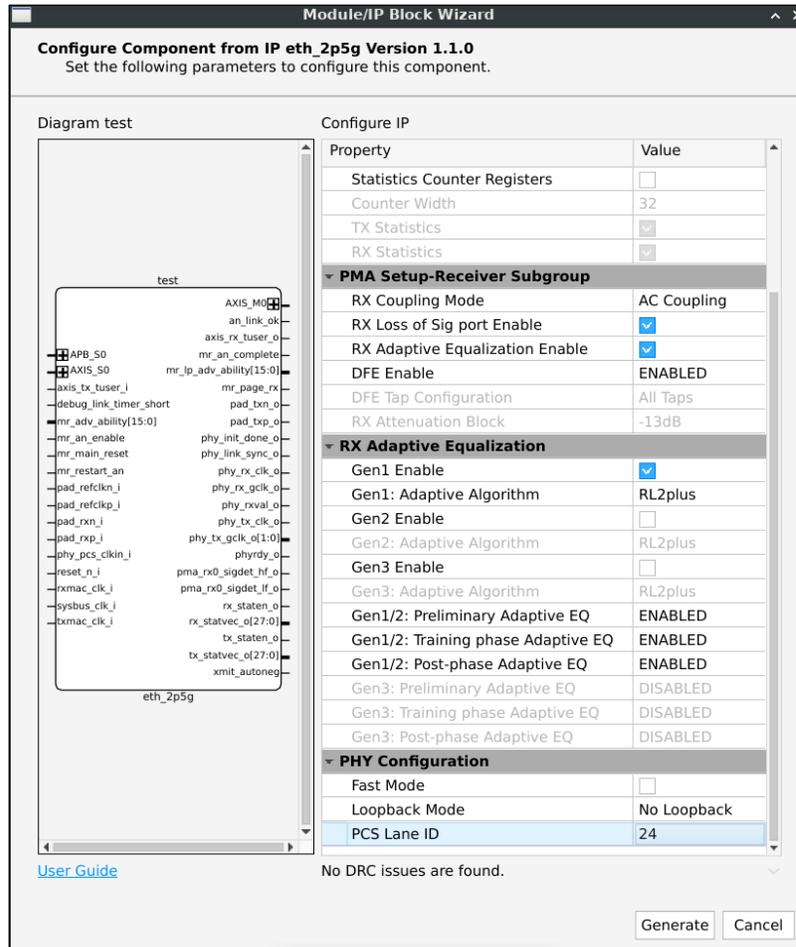

Figure 6.19. IP Component Configuration for Avant Device–MAC+PHY

- Verify the generated IP, and click **Finish**.

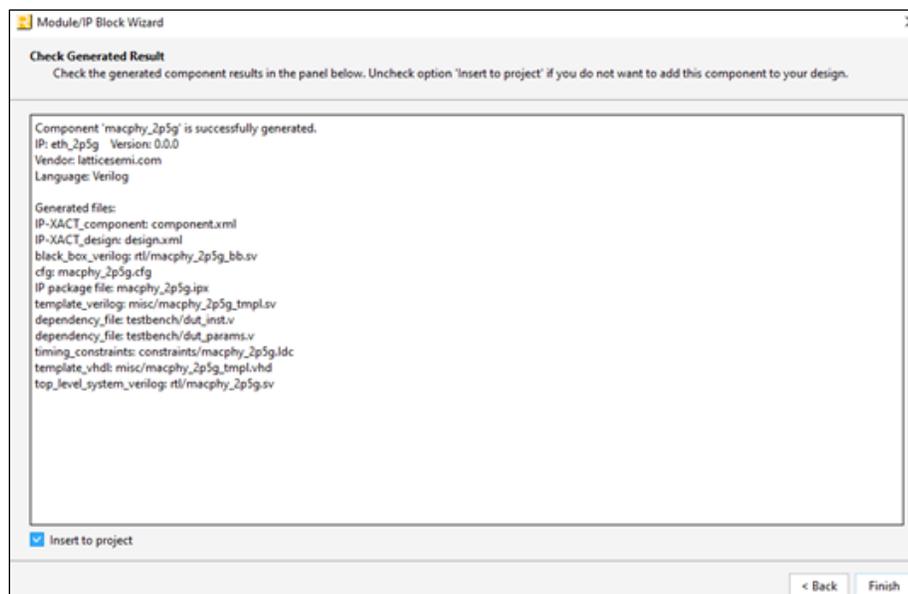

Figure 6.20. Importing Versa Files into a Project

The following table lists the files that are generated.

**Table 6.3. Generated File List for CertusPro-NX device**

Files	Description
<i>top.v</i>	Hardware example design top file.
<i>tb_top.v</i>	Simulation top file for hardware example design.
<i>pll_1.v</i>	PLL module from foundation IP.
<i>OSCC.v</i>	OSC module from foundation IP.
<i>pcs_apb_w.v; pcs_apb_w_r.v</i>	APB module for register configuration.
<i>traffic_genchk.v</i>	Traffic generator module for generator random traffic for transmission, and perform checking in loopback.
<i>debounce.v</i>	Debounce module for hardware mechanical input.
<i>cpnx_eval_2p5g.pdc</i>	Post synthesize constraint file for CertusPro-NX evaluation board.
<i>tb_top.do</i>	Script to group simulation signals.

**Table 6.4. Generated File List for Avant Device**

Files	Description
<i>top.v</i>	Hardware example design top file.
<i>tb_top.v</i>	Simulation top file for hardware example design.
<i>pcs_apb_w.v; pcs_apb_w_r.v</i>	APB module for register configuration.
<i>traffic_genchk.v</i>	Traffic generator module for generator random traffic for transmission, and perform checking in loopback.
<i>debounce.v</i>	Debounce module for hardware mechanical input.
<i>avant_eval_2p5g.pdc</i>	Post synthesize constraint file for Avant versa board.
<i>tb_top.do</i>	Script to group simulation signals.

### 6.5.3.3. Add Example Design Files into Project

To add an existing example design into a project, follow these steps:

1. Go to **Add-> Existing File...** and select existing example design from *IP\_NAME/eval/versa\_top/lfcpx\_2p5g\_macphy*. Top-level file to include in project: *top.v*

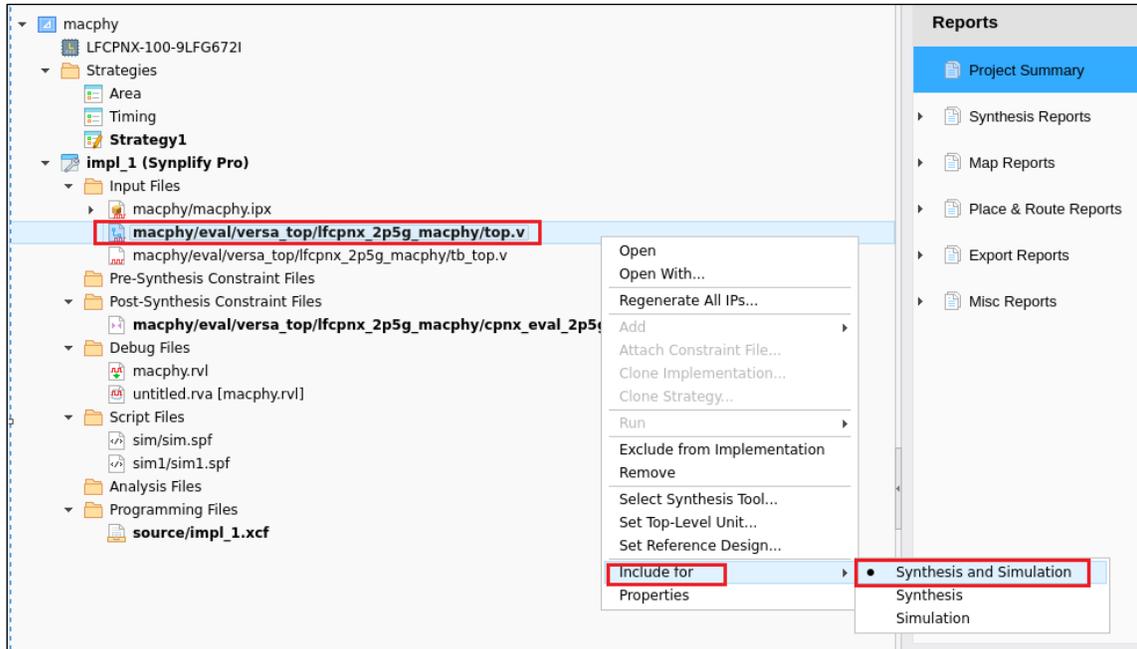

Figure 6.21. Steps to Set the top.v File

Simulation for top-level file to include: *tb\_top.v*

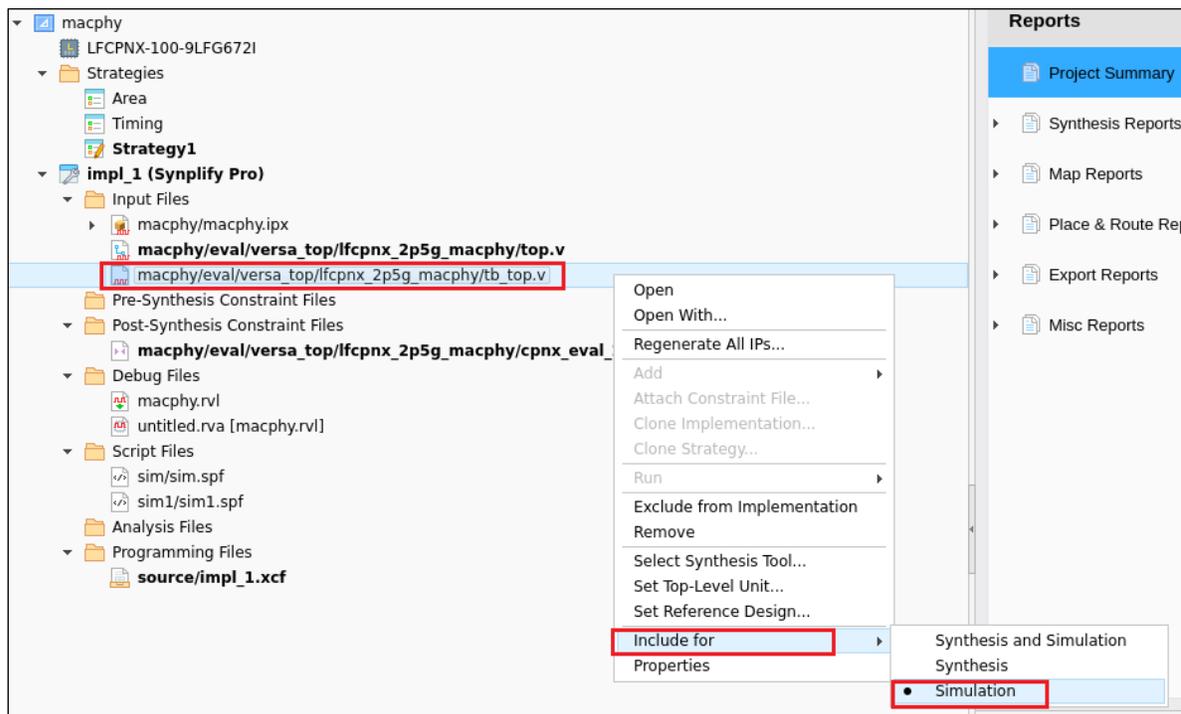

Figure 6.22. Steps to Set the tb\_top.v File

Post-synthesis constraint file: *cpnx\_eval\_2p5g.pdc*

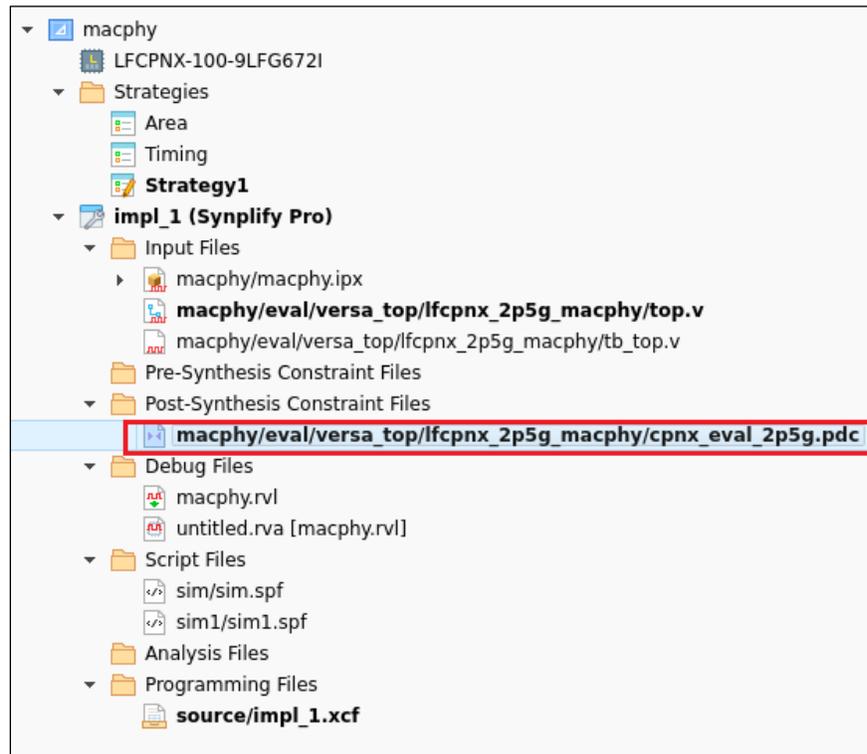

Figure 6.23. Steps to Add the *cpnx\_eval\_2p5g.pdc* File

2. Click **Run All** to compile the bitstream file from the design.

Figure 6.24. Generate Bitstream

3. After the Bitstream is compiled successfully, the run button turns green with a checked sign.

Figure 6.25. Bitstream Completion

### 6.5.3.4. Program Bitstream

To program the bitstream, follow these steps:

1. Go to **Tools -> Programmer** to launch the Radiant Programmer.

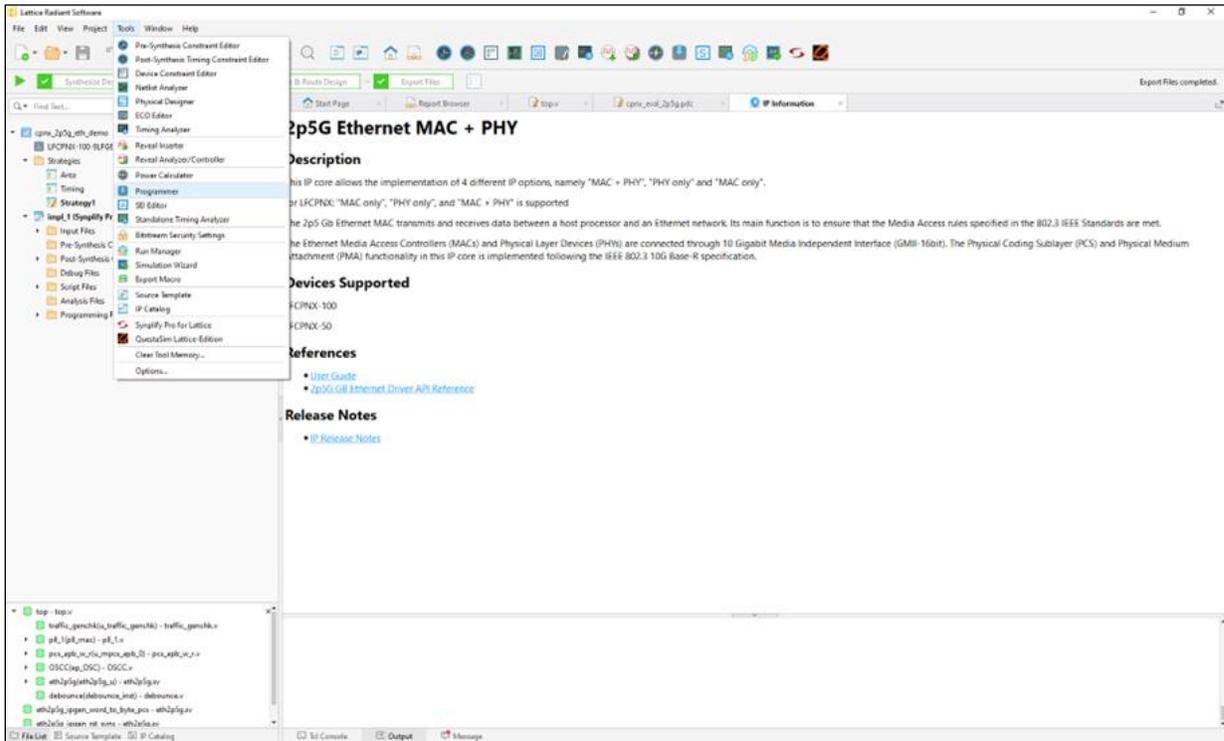

Figure 6.26. Programmer

2. Verify the setting under **Cable Setup**, the device family detected from the programmer, and the correct bitstream is selected in the **File Name** column.

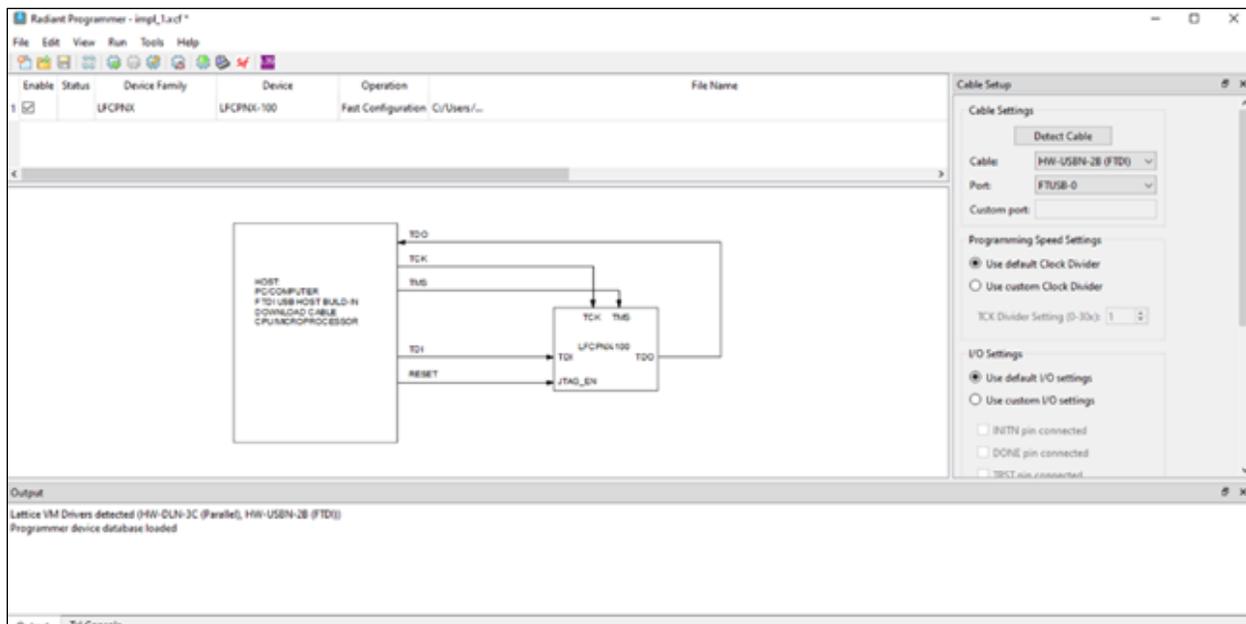

Figure 6.27. Select Bitstream

3. Select **Run -> Program Device** to program bitstream into the target device.

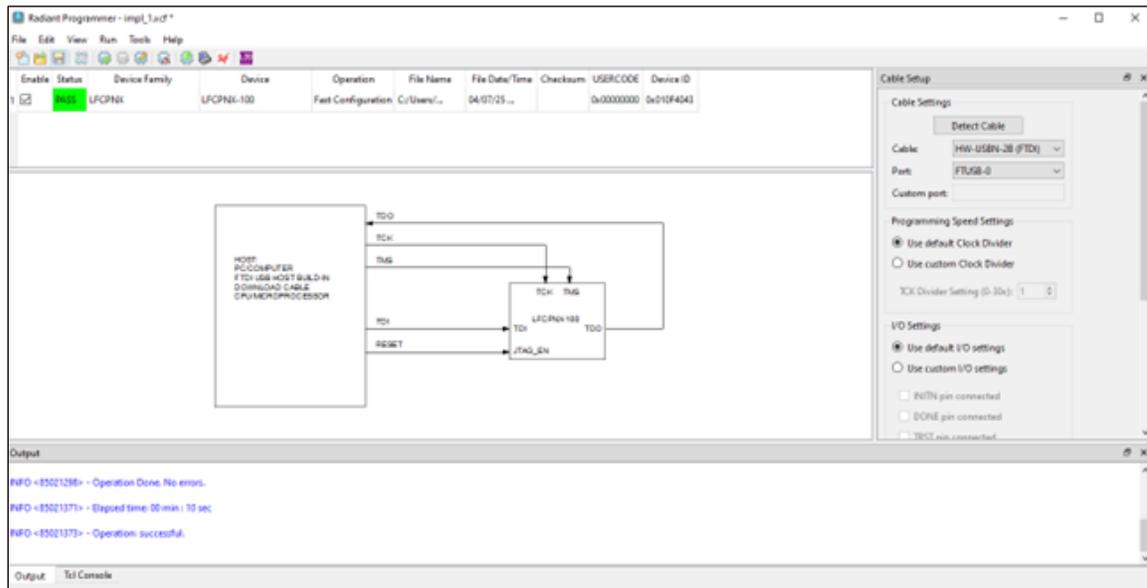

Figure 6.28. Programming Bitstream

#### 6.5.4. Hardware Setup for CertusPro-NX Evaluation Board with 2.5G Ethernet Example Design

Figure 6.29 shows the complete hardware setup for the example design. The CertusPro-NX Evaluation Board is powered up with 12 V power supply. The FMC daughtercard is connected to the CertusPro-NX Evaluation Board via SMA cables with TX and RX loopback setup. A 156.25 MHz LVDS reference clock is supplied from an external clock generator.

##### 6.5.4.1. DIP Switch Definition

The following table lists the programmed DIP switch for the CertusPro-NX Evaluation Board. After programming the bitstream into the device, make sure the DIP switch is configured to the right position before triggering RESET via a pushbutton.

Table 6.5. DIP Switch for CertusPro-NX Evaluation Board

DIP Switch Signal Name	DIP_SW1.
Default State	LOW.
Description	Traffic generator will be started when state transition from LOW to HIGH.

For more information on DIP\_SW1 (LOW) traffic generator trigger, refer to signal naming in the [CertusPro-NX Evaluation Board User Guide \(FPGA-EB-02046\)](#).

##### 6.5.4.2. Pushbutton

The following lists the programmed pushbutton for the CertusPro-NX Evaluation Board.

Table 6.6. Pushbuttons for CertusPro-NX Evaluation Board

DIP Switch Signal Name	SW1	SW5
Default State	HIGH	HIGH
Description	Reset button	Pause or resume the traffic transmission

To perform RESET after programming the bitstream, follow these steps:

1. Confirm that the traffic generator (DIP\_SW1) is LOW before triggering RESET.
2. After link-up is completed successfully, toggle DIP\_SW1 from LOW to HIGH to start the traffic generator.
3. Check onboard LED for device status.
4. You may pause the traffic transmission using SW5 if CONTINUOUS\_TRAFFIC is enabled (configuration is in *top.v* file).

### 6.5.4.3. LED Definition

LED\_1 to LED\_23 are programmed to light OFF in default state. Each LED will light up corresponding to the status of the example design. Refer to the following table for the description of each segment.

**Table 6.7. LED Description**

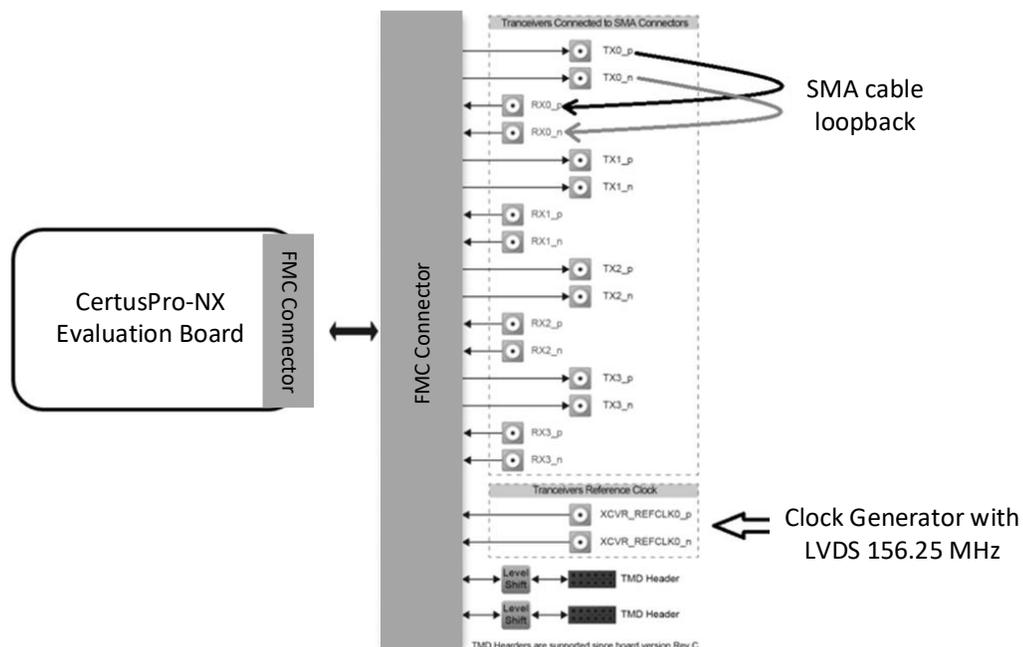

Signal Name	Description
LED_8 (Yellow color)	Reset asserted.
LED_9 (Yellow color)	PLL lock achieved.
LED_10 (Yellow color)	PHY link synchronization achieved.
LED_11 (Yellow color)	TX channel starts transmitting.
LED_12 (Yellow color)	RX channel starts receiving.
LED_13 (Yellow color)	Transmission completed or paused.
LED_14 (Yellow color)	FAIL data checker test.

For more information, refer to signal naming in the [CertusPro-NX Evaluation Board User Guide \(FPGA-EB-02046\)](#).

### 6.5.4.4. XTS-FMC Daughtercard Connection

Connect the XTS-FMC daughtercard to the CertusPro-NX Evaluation Board via the FMC connector. The XTS-FMC daughtercard connects J17 and J19 of TX SMA to J16 and J18 of RX SMA in loopback manner. The clock generator supplies XCVR REFCLK to J12 and J13 of input SMA.

To configure the *refclk* to source from external using DIFFCLKIO\_CORE and PCSREFMUX, refer to the [Reference Clocks](#) section.

**Figure 6.29. Connectivity Block for CertusPro-NX and XTS-FMC Loopback**

For the naming of the SMA ports on the XTS-FMC Board, refer to the [XTS-FMC Board](#) web page.

#### 6.5.4.5. Hardware Validation Result

The USB-Mini B connects to the host, enabling the Reveal tool to monitor hardware signals, such as TX, RX, and status indicators.

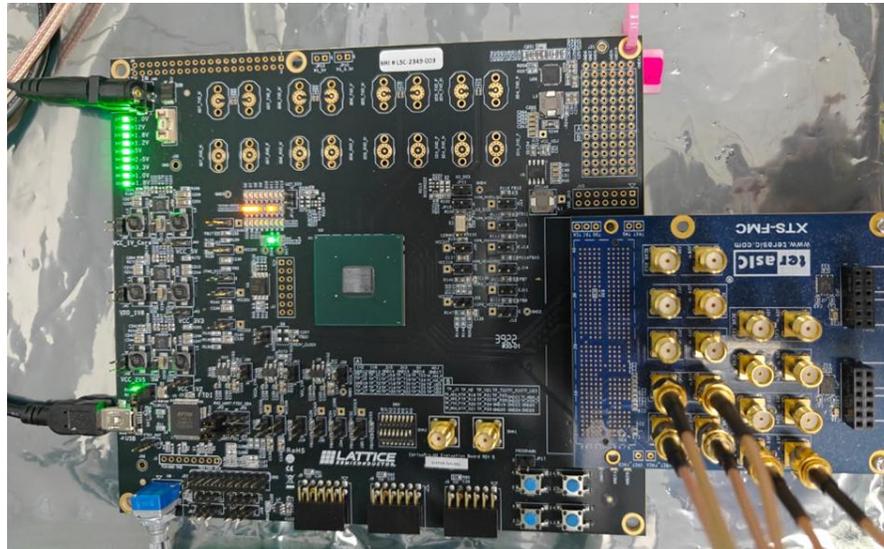

Figure 6.30. Actual Board Setup

The following figure shows continuous transmission from the pattern generator to populate the TX and RX in a loopback setup of the CertusPro-NX Evaluation Board. Each frame is validated in the checker. If there is any mismatch, the *cmpfail\_o* signal is asserted. These signals must be added to the Reveal tool manually. For more information, refer to the [Reveal User Guide for Radiant Software](#).

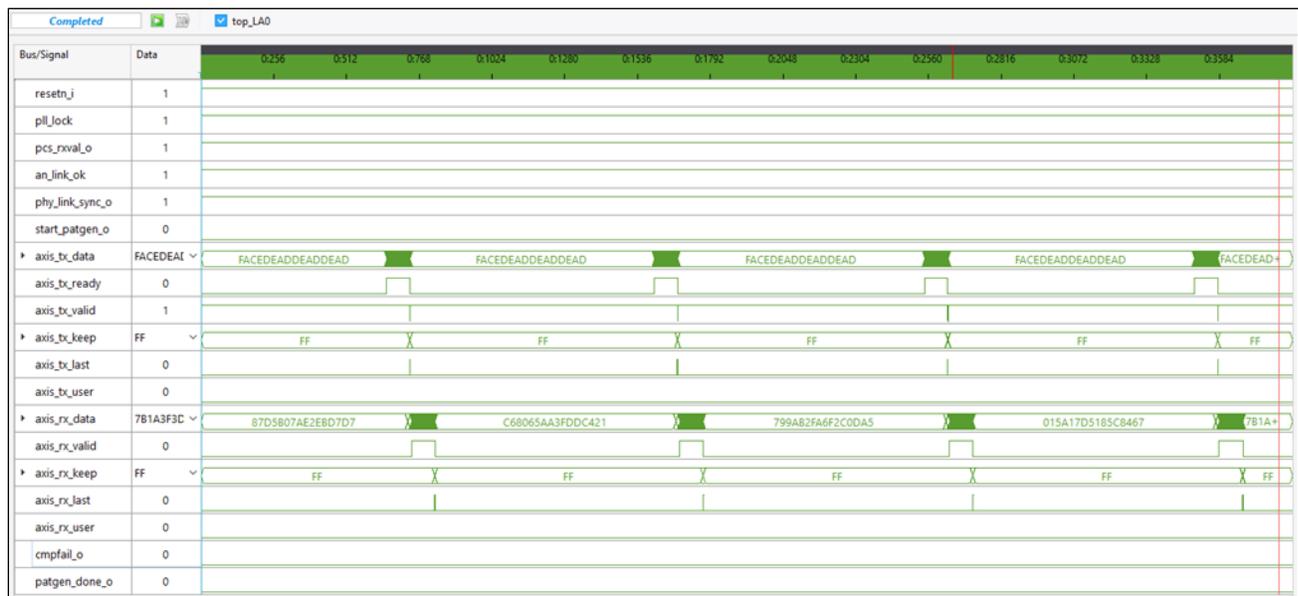

Figure 6.31. Reveal Signal During Transmission

### 6.5.5. Hardware Setup for Avant Versa Board with 2.5G Ethernet Example Design

Figure 6.34 shows the complete hardware setup for the example design. The Avant Versa Board is powered up with 12 V power supply. The 10G SFP+ Loopback module is connected to the Avant Versa Board for TX and RX loopback setup. For more information on the 10G SFP+ loopback module, visit the [FS website](#).

#### 6.5.5.1. DIP Switch Definition

The following table lists the programmed DIP switch for the Avant Versa Board. After programming the bitstream into the device, make sure the DIP switch is configured to the right position before triggering RESET via a pushbutton.

**Table 6.8. DIP Switch for CertusPro-NX Evaluation Board**

<b>DIP Switch Signal Name</b>	DIP_SW_1.
<b>Default State</b>	LOW.
<b>Description</b>	Traffic generator will be started when state transition from LOW to HIGH.

For more information on DIP\_SW1 (LOW) Traffic generator trigger, refer to signal naming in the [Avant G/X Versa Board User Guide \(FPGA-EB-02063\)](#).

#### 6.5.5.2. Pushbutton

The following lists the programmed pushbutton for the Avant Versa Board.

**Table 6.9. Pushbuttons for Avant Versa Board**

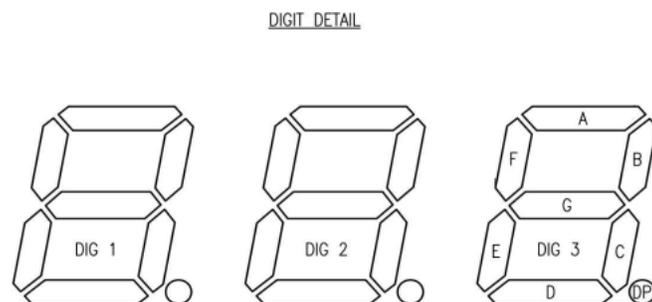

<b>DIP Switch Signal Name</b>	SW12	SW13	SW14
<b>Default State</b>	HIGH	HIGH	HIGH
<b>Description</b>	Reset button	Pause or resume the traffic transmission.	Change traffic transmission length type.

To perform RESET after programming the bitstream, follow these steps:

1. Confirm that the traffic generator (DIP\_SW1) is LOW before triggering RESET.
2. After link-up is completed successfully, toggle DIP\_SW1 from LOW to HIGH to start the traffic generator.
3. Check onboard LED for device status.
4. You may pause the traffic transmission using SW13 if CONTINUOUS\_TRAFFIC is enabled (configuration is in the *top.v* file).
5. You may change the packet length type generated from the generator by using SW14. Perform this when the transmission is paused.

#### 6.5.5.3. Segment Displays

The Avant-G/X Versa Board provides a three-character, seven-segment LED display (D8) that is connected to the I/O within Bank 13. Refer to the following table for the description of each segment.

**Figure 6.32. Segment Displays Diagram**

For more information, refer to signal naming in the [Avant G/X Versa Board User Guide \(FPGA-EB-02063\)](#).

**Table 6.10. LED Segment for DIG 1 Description**

LED Segment for DIG 1	Description
SEG_A	Reset asserted.
SEG_B	AN link OK achieved.
SEG_C	PHY link synchronization achieved.
SEG_D	TX channel starts transmitting.
SEG_E	RX channel starts receiving.
SEG_F	Transmission completed or paused.
SEG_G	FAIL data checker test.

6DIG 3 displays code corresponding to different types of frame length, including static frame size, randomize frame size, and incremental frame size. To change the type of frame size, use pushbutton SW14.

**Table 6.11. LED 7-Segment for DIG 3 Description**

Code for DIG 3	Code Description
0	Fix frame size.
1	Randomize frame size.
2	Incremental frame size.

The maximum and minimum boundary for randomized and incremental frame size can be defined in the top file, traffic\_genchk module.

FRAME\_LEN\_MIN is the minimum value for randomized size, and the starting value for incremental frame size.

FRAME\_LEN\_MAX is the maximum value for randomized size, and the largest value for incremental frame size, which starts over again using the minimum value.

FRAME\_LEN\_INIT is used for defining the static frame size.

```

traffic_genchk #(
    .CONTINUOUS_TRAFFIC (CONTINUOUS_TRAFFIC),
    .MAX_DATA_WIDTH(AXI_DATA_WIDTH),
    .MASK_DATA( (AXI_DATA_WIDTH == 128) ? 128'hEF45_4255_3A4C_5ECA_EF45_4255_3A4C_5ECA : 64'hEF45_4255_3A4C_5ECA ),
    .FRAME_LEN_MIN(16'd128),
    .FRAME_LEN_MAX(16'd9600),
    .FRAME_LEN_INIT(16'd1500)
) u_traffic_genchk (

```

**Figure 6.33. Parameters for Frame Size in the Top File**

### 6.5.5.4. Hardware Validation Result

The USB-Mini B connects to the host, enabling the Reveal tool to monitor hardware signals, such as TX, RX, and status indicators.

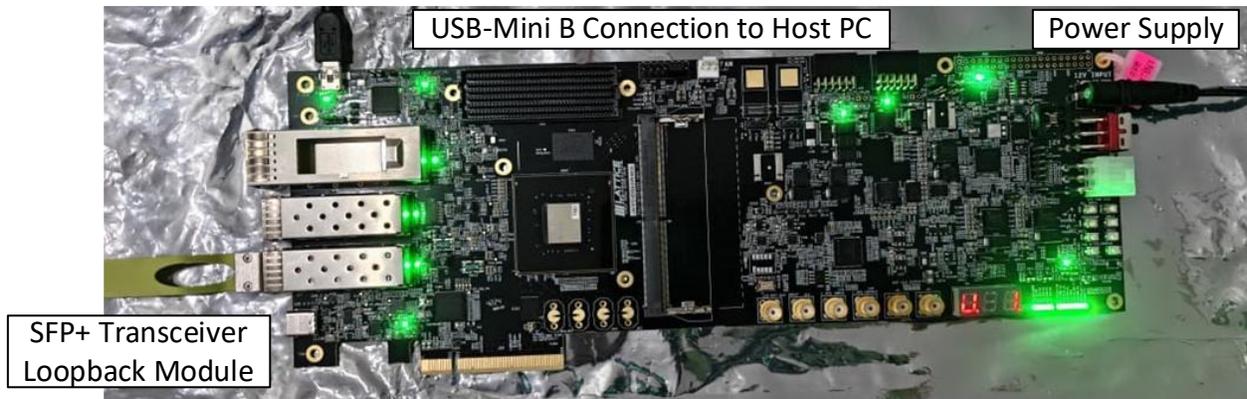

Figure 6.34. Actual Board Setup

The following figure shows continuous transmission from the pattern generator to populate the TX and RX in a loopback setup of the Avant Versa Board. Each frame is validated in the checker. If there is any mismatch, the *cmpfail\_o* signal is asserted. These signals must be added to the Reveal tool manually. For more information, refer to the [Reveal User Guide for Radiant Software](#).

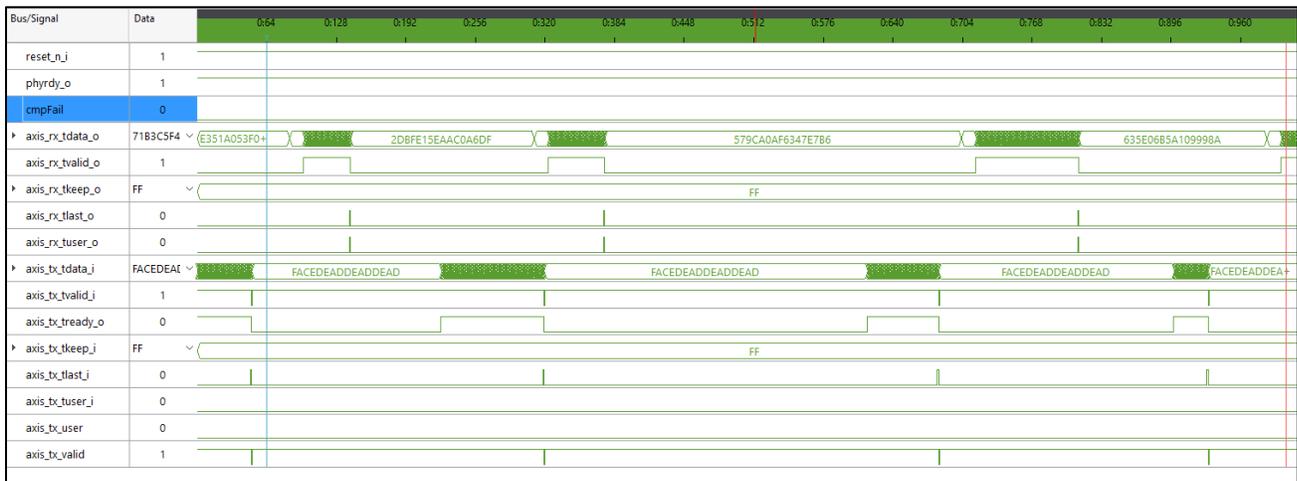

Figure 6.35. Reveal Signal During Transmission

## 7. Designing with the IP

This section provides information on how to generate the IP core using the Lattice Radiant software and how to run simulation and synthesis. For more details on the Lattice Radiant software, refer to the Lattice Radiant Software User Guide on the [Lattice Radiant Software](#) web page.

**Note:** The screenshots provided are for reference only. Details may vary depending on the version of the IP or software being used. If there have been no significant changes to the GUI, a screenshot may reflect an earlier version of the IP.

### 7.1. Generating and Instantiating the IP

You can use the Radiant software to generate IP modules and integrate them into the device architecture. The steps below describe how to generate the 2.5G Ethernet IP in the Radiant software.

To generate the 2.5G Ethernet IP, follow these steps:

1. Create a new Lattice Radiant software project or open an existing project.
2. In the **IP Catalog** tab, double-click 2.5G Ethernet under **IP, Connectivity** category. The **Module/IP Block Wizard** opens as shown in the following figure. Enter values in the **Component name** and the **Create in** fields and click **Next**.

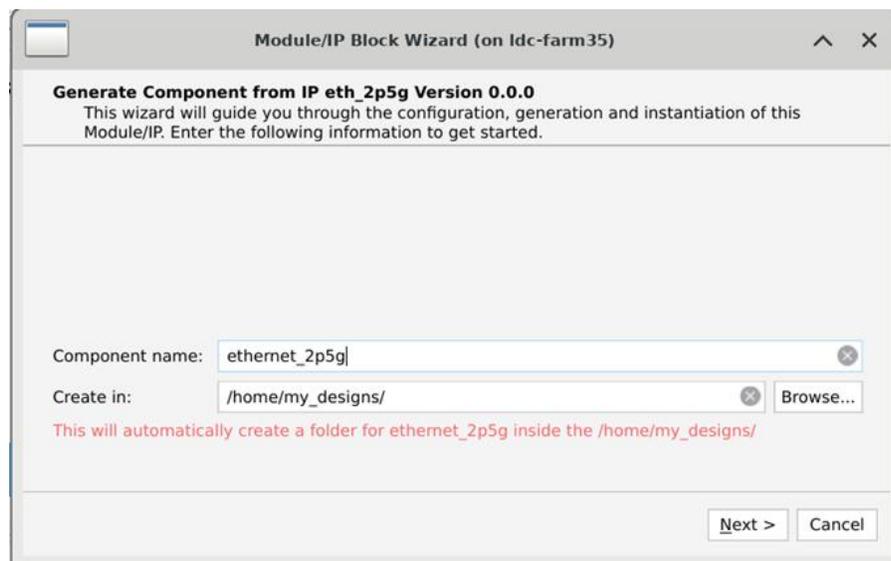

Figure 7.1. Module/IP Block Wizard

3. In the next **Module/IP Block Wizard** window, customize the selected 2.5G Ethernet IP using drop-down lists and check boxes. The following figure shows an example configuration of the 2.5G Ethernet IP. For details on the configuration options, refer to the [IP Parameter Description](#) section.

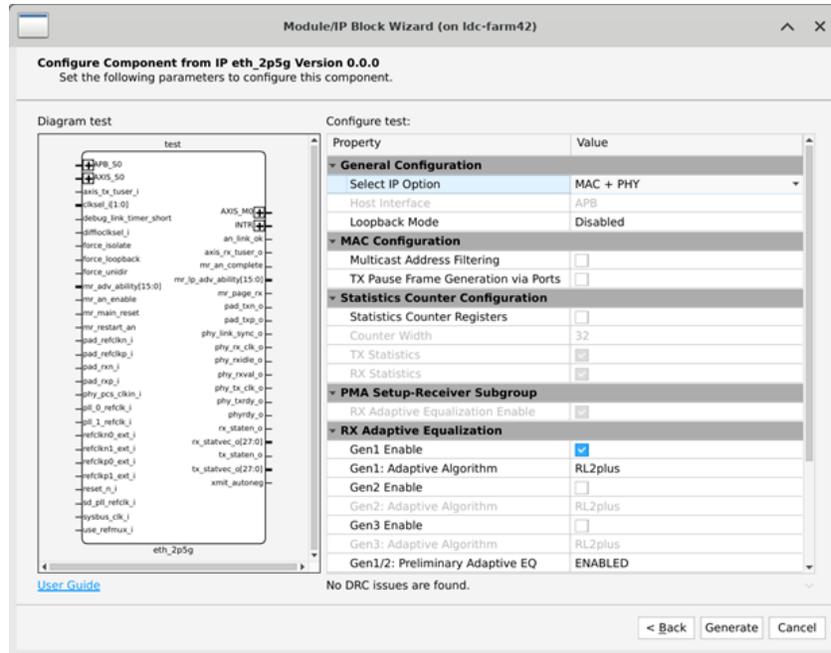

Figure 7.2. IP Configuration

- Click **Generate**. The **Check Generating Result** dialog box opens, showing design block messages and results as shown in Figure 7.3.

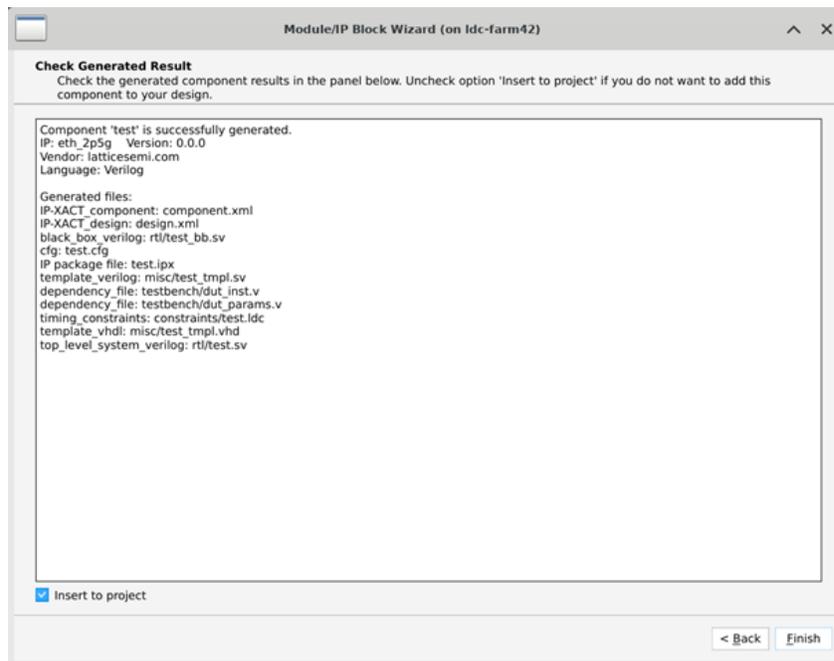

Figure 7.3. Check Generated Result

- Click **Finish**. All the generated files are placed under the directory paths in the **Create in** and the **Component name** fields shown in Figure 7.1.

### 7.1.1. Generated Files and File Structure

The generated 2.5G Ethernet module package includes the closed box (<Component name>\_bb.v) and instance templates (<Component name>\_tpl.v/vhd) that can be used to instantiate the core in a top-level design. An example RTL top-level reference source file (<Component name>.v) that can be used as an instantiation template for the module is also provided. You may also use this top-level reference as the starting template for the top-level for their complete design. The generated files are listed in the table below.

**Table 7.1. Generated File List**

Attribute	Description
<Component name>.ipx	This file contains the information on the files associated to the generated IP.
<Component name>.cfg	This file contains the parameter values used in IP configuration.
component.xml	Contains the ipxact: component information of the IP.
design.xml	Documents the configuration parameters of the IP in IP-XACT 2014 format.
rtl/<Component name>.v	This file provides an example RTL top file that instantiates the module.
rtl/<Component name>_bb.v	This file provides the synthesis closed box.
misc/<Component name>_tpl.v misc /<Component name>_tpl.vhd	These files provide instance templates for the module.

## 7.2. Design Implementation

Completing your design includes additional steps to specify analog properties, pin assignments, and timing and physical constraints. You can add and edit the constraints using the Device Constraint Editor or by manually creating a PDC file.

Post-Synthesis constraint files (.pdc) contain both timing and non-timing constraint .pdc source files for storing logical timing or physical constraints. Constraints that are added using the Device Constraint Editor are saved to the active .pdc file. The active post-synthesis design constraint file is then used as input for post-synthesis processes.

Refer to the relevant sections in the Lattice Radiant Software User Guide for more information on how to create or edit constraints and how to use the Device Constraint Editor.

## 7.3. Timing Constraints

The timing constraints are based on the clock frequency used. The timing constraints for the IP are defined in relevant constraint files. The example below shows the IP timing constraints generated for the two IP options in 2.5G Ethernet IP. To ensure successful timing closure, you must include the recommended constraints in the constraint file. For more information on timing constraints, refer to the [Lattice Radiant Timing Constraints Methodology Application Note \(FPGA-AN-02059\)](#).

### 7.3.1. Timing Constraint File (.pdc) for the CPNX device with MAC+PHY Option

## 7.4. Specifying the Strategy

The Radiant software provides two predefined strategies: Area and Timing. It also enables you to create customized strategies. For details on how to create a new strategy, refer to the *Strategies* section of the *Lattice Radiant Software User Guide* on the [Lattice Radiant Software](https://www.latticesemi.com/legal) web page.

## 7.5. Running Functional Simulation

You can run functional simulation after the IP is generated.

To run functional simulation, follow these steps:

1. Click the  button located on the **Toolbar** to initiate the **Simulation Wizard** shown in the figure below.

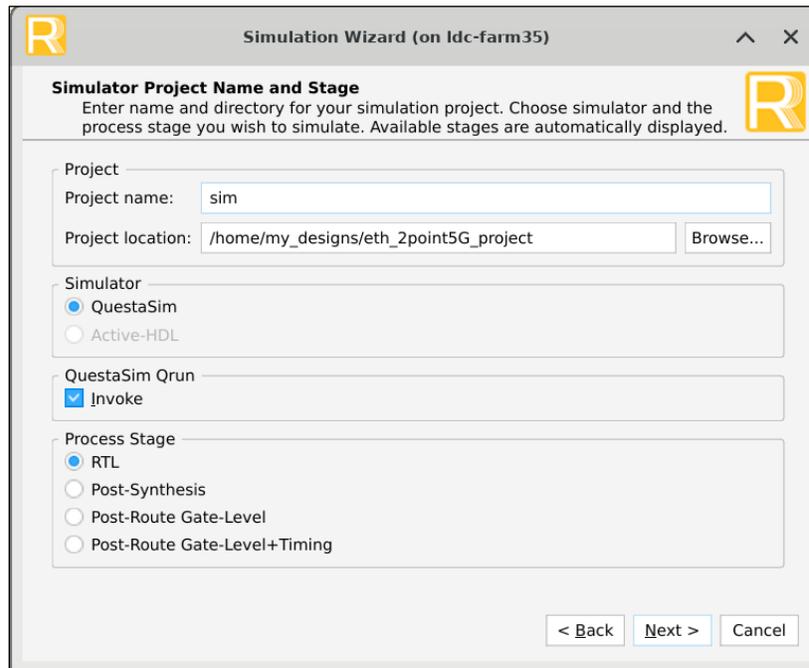

Figure 7.4. Simulation Wizard

2. Click **Next** to open the **Add and Reorder Source** window as shown in the figure below.

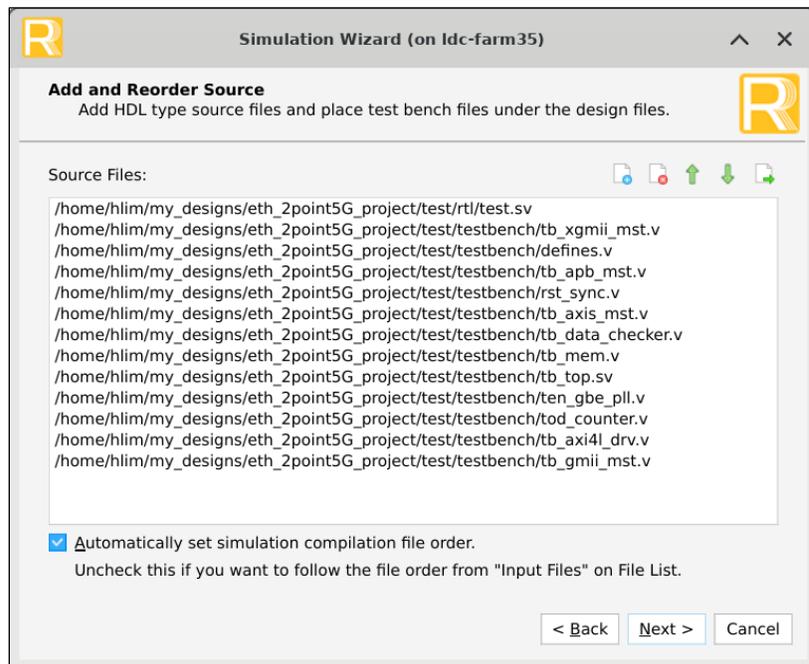

Figure 7.5. Add and Reorder Source

3. Click **Next**. The **Summary** window is shown.

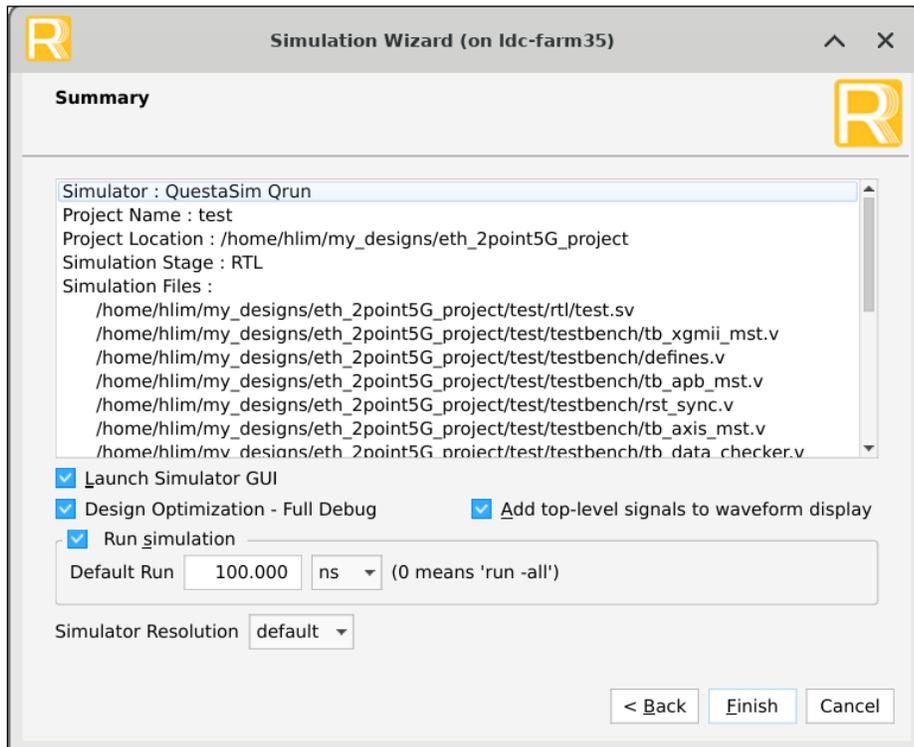

Figure 7.6. Summary Window

4. Click **Finish** to run the simulation.

**Note:** It is necessary to follow the procedure above until it is fully automated in the Lattice Radiant Software Suite. The waveform below shows an example of the simulation result.

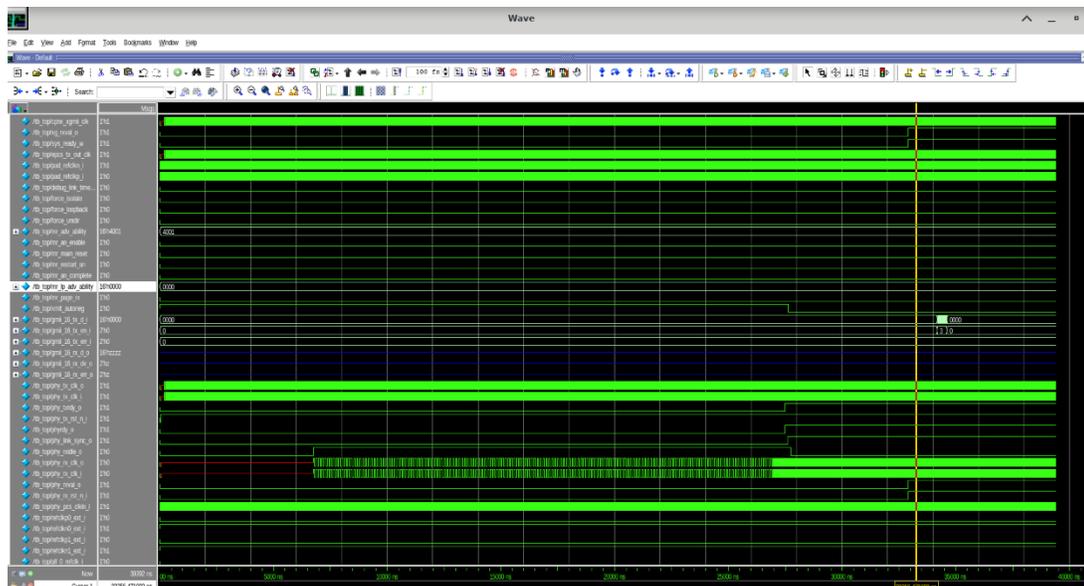

Figure 7.7. Simulation Waveform

### 7.5.1. Simulation Results

The following figure shows the details of the simulation results.

Figure 7.8. Simulation Result

## 8. Known Issues

### 8.1. Minimum IPG Limitation

#### 8.1.1. Devices Affected

- CertusPro-NX devices (LFPCNX-50/100)
- Avant-AT-G devices and Avant-AT-X devices

#### 8.1.2. Designs Affected

This issue affects only designs using the *MAC only* and *MAC + PHY* IP option with 16-bit GMII interface. The *PHY* IP option is not affected.

#### 8.1.3. Minimum IPG Limitation

The 2.5G TX MAC is designed to generate an IDLE packet when no data is being transmitted. Ideally, the minimum Inter-Packet Gap (IPG) must be 12 bytes on average. However, the minimum achievable IPG is approximately 26 bytes.

#### 8.1.4. Planned Fix

Lattice plans to resolve this issue in a future release.

### 8.2. Timing Closure

Achieving timing closure is difficult when using the 2.5G Ethernet IP code at the lowest speed grade for CertusPro-NX or Nexus devices. Therefore, speed grade 7 is recommended only for the default configuration, where all optional parameters and advanced features remain disabled. If the design requires enabling any additional features or parameters through the GUI, a higher speed grade must be used. For CertusPro-NX devices, speed grade 8 or higher is recommended for all enhanced configurations, as these grades provide sufficient timing margin to support optional features across all modes.

## Appendix A. Resource Utilization

The following tables show the resource utilization of the 2.5G Ethernet IP core.

**Table A.1. Resource Utilization for LFCPNX-100-9LFG672C (APB)**

Configuration	Registers	LUTs	EBRs	Target Device	Synthesis Tools
<b>PHY Only</b> Default	684 (1%)	851 (1%)	0	LFCPNX-100-9LFG672C	Synplify Pro
<b>MAC + PHY</b> default	5,419 (7%)	6,403 (8%)	58 (28%)	LFCPNX-100-9LFG672C	Synplify Pro
<b>MAC + PHY</b> Full featured Stat counter 32	9,559 (12%)	10,107 (13%)	58 (28%)	LFCPNX-100-9LFG672C	Synplify Pro
<b>MAC + PHY</b> Full featured Stat counter 64	12,825 (16%)	13,039 (16%)	58 (28%)	LFCPNX-100-9LFG672C	Synplify Pro
<b>MAC Only</b> default	4,734 (6%)	5,604 (7%)	58 (28%)	LFCPNX-100-9LFG672C	Synplify Pro
<b>MAC Only</b> Full featured Stat counter 32	8,627 (11%)	9,279 (12%)	58 (28%)	LFCPNX-100-9LFG672C	Synplify Pro
<b>MAC Only</b> Full featured Stat counter 64	12,147 (15%)	12,336 (15%)	58 (28%)	LFCPNX-100-9LFG672C	Synplify Pro

**Table A.2. Resource Utilization for LAV-AT-X70-3LFG1156I (APB)**

Configuration	Registers	LUTs	EBRs	Target Device	Synthesis Tools
<b>PHY Only</b> Default	907 (1%)	1,091 (1%)	0	LAV-AT-X70-3LFG1156I	Synplify Pro
<b>MAC + PHY</b> default	5,674 (1%)	6,581 (2%)	29 (3%)	LAV-AT-X70-3LFG1156I	Synplify Pro
<b>MAC + PHY</b> Full featured Stat counter 32	9,862 (2%)	10,163 (3%)	29 (3%)	LAV-AT-X70-3LFG1156I	Synplify Pro
<b>MAC + PHY</b> Full featured Stat counter 64	13,117 (3%)	13,152 (3%)	29 (3%)	LAV-AT-X70-3LFG1156I	Synplify Pro
<b>MAC Only</b> default	4,767 (1%)	5,523 (1%)	29 (3%)	LAV-AT-X70-3LFG1156I	Synplify Pro
<b>MAC Only</b> Full featured Stat counter 32	8,681 (2%)	9,098 (2%)	29 (3%)	LAV-AT-X70-3LFG1156I	Synplify Pro
<b>MAC Only</b> Full featured Stat counter 64	12,201 (3%)	11,984 (3%)	29 (3%)	LAV-AT-X70-3LFG1156I	Synplify Pro

## Appendix B. Guide to Close Timing

For further improvement in timing closure, you can apply the `set_max_delay` constraint to prioritize specific timing paths. For example, the following constraint is used:

```
set_max_delay -from [get_pins {lssc_2p5_gbe_top_inst/genblk1.lssc_ten_gbe_mac_inst/
u_ten_gbemac_core/rx_ram/u_mem0/mem_main/NON_MIX.ADDR_ROUTE[0].DATA_ROUTE[1].no_init.
u_mem0/LIFCL_MEM.pdp16k.PDP16K_MODE_inst/DO35}] -to [get_pins {lssc_2p5_gbe_top_inst/
genblk1.lssc_ten_gbe_mac_inst/u_ten_gbemac_core/rmac_buf/frames_present_reg[*].ff_inst/DF}]
-datapath_only 5.76
```

This command sets a maximum data path delay of 5.76 ns between the specified source and destination pins. The `-datapath_only` option ensures that only the datapath delay is considered, excluding clock skew and other clock path delays. By tightening the timing constraint from the original 6.4 ns to 5.76 ns, the tool is instructed to give higher priority to this path during place and route process. This can lead to improved timing closure and better overall performance, especially for critical paths.

To further increase the likelihood of meeting timing constraints, you are encouraged to perform multiple iterations of synthesis and place-and-route. Each iteration allows the tool to explore different optimization strategies and placement solutions, which can improve the timing results incrementally. This iterative approach is especially effective when combined with targeted constraints like `set_max_delay`, as it helps the tool converge on an optimal solution over time. You can set the number of iterations in the place and route session under Strategy1 as shown in the figure below.

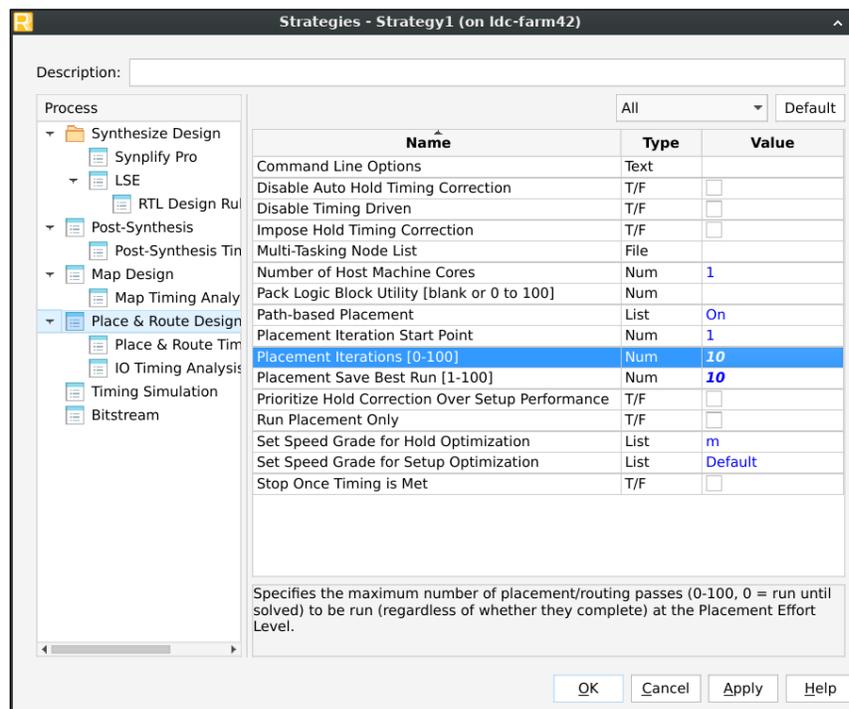

Figure B.1. Multiple Iterations of Place and Route

## Technical Support Assistance

Submit a technical support case through [www.latticesemi.com/techsupport](http://www.latticesemi.com/techsupport).

For frequently asked questions, refer to the Lattice Answer Database at [www.latticesemi.com/Support/AnswerDatabase](http://www.latticesemi.com/Support/AnswerDatabase).

## Revision History

**Note:** In some instances, the IP may be updated without changes to the user guide. The user guide may reflect an earlier IP version but remains fully compatible with the later IP version. Refer to the IP Release Notes for the latest updates.

### Revision 1.4, IP v1.1.0, February 2026

Section	Change Summary
Introduction	<ul style="list-style-type: none"> <li>Updated the modes for CertusPro-NX in <a href="#">Table 1.2. 2.5G Ethernet IP Support Readiness</a>.</li> <li>Updated the note for <a href="#">Table 1.3. Minimum Device Requirements for 2.5G Ethernet IP Core</a>.</li> </ul>
Functional Description	<ul style="list-style-type: none"> <li>Updated the <a href="#">IP Architecture Overview</a> section for MAC + PHY (Avant Device).</li> <li>Updated <a href="#">Figure 2.14. 2.5G PHY Only Architecture Diagram</a>.</li> <li>Updated the <a href="#">Lane Merging (CertusPro-NX Device)</a> section.</li> <li>Updated <a href="#">Figure 2.17. Typical Transmit Timing Diagram</a>.</li> <li>Updated <a href="#">Figure 2.18. Typical Receive Timing Diagram</a>.</li> <li>Updated the <a href="#">IP Architecture Overview</a> section for PHY (Avant Devices).</li> <li>Updated the <a href="#">Lane Merging (Avant Devices)</a> section.</li> <li>Updated the title for the <a href="#">Clocking Overview for CertusPro-NX Device</a> section.</li> <li>Added the <a href="#">Clocking Overview for Avant Devices</a> section.</li> <li>Updated the <a href="#">Reset</a> section.</li> </ul>
Signal Description	<ul style="list-style-type: none"> <li>Updated <a href="#">Table 4.1. Signal Description—MAC + PHY</a>.</li> <li>Updated <a href="#">Table 4.2. Signal Description—PHY Only (CertusPro-NX Devices)</a>.</li> <li>Updated <a href="#">Table 4.4. Signal Description—MAC + PHY</a>.</li> <li>Updated <a href="#">Table 4.5. Signal Description—PHY Only (Avant Devices)</a>.</li> </ul>
Register Description	Updated the access type for PAUSE_OPCODE register in <a href="#">Table 5.4. Configuration Registers for MAC</a> .
Known Issues	Added the <a href="#">Timing Closure</a> section.

### Revision 1.3, IP v1.1.0, December 2025

Section	Change Summary
All	<ul style="list-style-type: none"> <li>Updated the IP version on the cover page.</li> <li>Renamed 2.5G Ethernet MAC + PHY IP to 2.5G Ethernet IP.</li> <li>Removed mentions of MDIO interface.</li> </ul>
Introduction	Updated the following sections: <ul style="list-style-type: none"> <li>Quick Facts section.</li> <li>Licensing and Ordering Information section.</li> <li>IP Validation Summary section.</li> <li>Minimum Device Requirements section.</li> </ul>
Functional Description	<ul style="list-style-type: none"> <li>Updated the MAC + PHY (CertusPro-NX Device) section.</li> <li>Added the MAC + PHY (Avant Device) section.</li> <li>Updated the section title <i>Lane Merging</i> to <i>Lane Merging (CertusPro-NX)</i>.</li> <li>Added the PHY (Avant Devices) section.</li> <li>Updated the title for <a href="#">Figure 2.28. 2.5G IP Core Clock Domain Block Diagram for CertusPro-NX Device</a>.</li> </ul>
IP Parameter Description	<ul style="list-style-type: none"> <li>Updated the section title <i>MAC + PHY</i> to <i>MAC + PHY (CertusPro-NX)</i>.</li> <li>Updated the PHY Only (CertusPro-NX) section.</li> <li>Added the MAC + PHY (Avant Devices) section.</li> <li>Added the PHY Only (Avant Devices) section.</li> </ul>
Signal Description	<ul style="list-style-type: none"> <li>Updated the PHY Only Signals (CertusPro-NX Devices) section.</li> <li>Added the following sections: <ul style="list-style-type: none"> <li>MAC + PHY Signals (Avant Devices).</li> </ul> </li> </ul>

Section	Change Summary
	<ul style="list-style-type: none"> <li>PHY Only Signals (Avant Devices).</li> </ul>
Register Description	<ul style="list-style-type: none"> <li>Updated the description for tx_pausedreq register in Table 5.16. [0x030] MAC_CTL Register.</li> <li>Added the Register Address Mapping section.</li> <li>Added the PHY Registers (Avant Devices) section.</li> </ul>
Example Design	<ul style="list-style-type: none"> <li>Updated the introduction to include Avant G/X Versa board.</li> <li>Updated the following sections: <ul style="list-style-type: none"> <li>Example Design Supported Configuration section.</li> <li>Overview of Example Design and Features section.</li> <li>Example Design Components section.</li> <li>Simulating the Example Design section.</li> <li>Hardware Testing section.</li> </ul> </li> </ul>
Designing with the IP	Updated the Timing Constraints section.
Known Issues	Updated this section to state that the known issue also affects Avant devices.
Resource Utilization	<ul style="list-style-type: none"> <li>Updated Table A.1. Resource Utilization for LFCPNX-100-9LFG672C (APB).</li> <li>Added Table A.2. Resource Utilization for LAV-AT-X70-3LFG1156I (APB).</li> </ul>
References	<ul style="list-style-type: none"> <li>Updated a document titled <i>2.5G Ethernet MAC + PHY IP Release Notes to 2.5G Ethernet IP Release Notes</i>.</li> <li>Added references to the Avant G and Avant X web pages.</li> <li>Added the following documents: <ul style="list-style-type: none"> <li>Lattice Avant SERDES/PCS User Guide (FPGA-TN-02313)</li> <li>Lattice Avant-G/X MPPHY Module User Guide (FPGA-IPUG-02233)</li> <li>CertusPro-NX Evaluation Board User Guide (FPGA-EB-02046)</li> <li>Avant G/X Versa Board User Guide (FPGA-EB-02063)</li> <li>Reveal User Guide for Radiant Software</li> </ul> </li> </ul>

### Revision 1.2, IP v1.0.0, October 2025

Section	Change Summary
All	Removed all content and references related to MachXO5™-NX device support.

### Revision 1.1, IP v1.0.0, July 2025

Section	Change Summary
Introduction	Updated the Features section.

### Revision 1.0, IP v1.0.0, June 2025

Section	Change Summary
All	Initial release.
