**Table 7: Combinatorial Primitives**

| Primitive               | Description                       |
|-------------------------|-----------------------------------|
| <a href="#">CCU2</a>    | Carry Chain                       |
| <a href="#">LUT4</a>    | 4-Input Look Up Table             |
| <a href="#">WIDEFN9</a> | 9-Input Single Output Logic Block |

**Table 8: Interfaces**

| Primitive                 | Description                                                     |
|---------------------------|-----------------------------------------------------------------|
| <a href="#">I2CFIFO</a>   | Hardened I2C Interface Block                                    |
| <a href="#">MIPI</a>      | Soft MIPI Interface Block                                       |
| <a href="#">MULTIBOOT</a> | Interface for Multiboot Functionality                           |
| <a href="#">PCIE</a>      | Hardened PCIE Interface                                         |
| <a href="#">SEDC</a>      | Interface for Soft Error Detection and Correction Functionality |
| <a href="#">SGMIICDR</a>  | Serial Gigabit Media Independent Interface                      |

**Table 9: Dual Data Rate Cells**

| Primitive              | Description                                              |
|------------------------|----------------------------------------------------------|
| <a href="#">DDRDLL</a> | Delay-Locked Loop Master Block for DDR Functionality     |
| <a href="#">DELAYA</a> | Dynamic Input/Output Delay Element                       |
| <a href="#">DELAYB</a> | Static Input/Output Delay Element                        |
| <a href="#">DELAYC</a> | Supports edge monitor feature                            |
| <a href="#">DLLDEL</a> | Delay-Locked Loop Slave Block for DDR Functionality      |
| <a href="#">DQSBUF</a> | Block generating DQS Signal for Memory DDR Functionality |
| <a href="#">IDDR71</a> | 7:1 LVDS IDDR                                            |
| <a href="#">IDDRX1</a> | Generic X1 IDDR                                          |

**Table 9: Dual Data Rate Cells**

| Primitive                 | Description                                                                                                   |
|---------------------------|---------------------------------------------------------------------------------------------------------------|
| <a href="#">IDDRX2</a>    | Generic X1 IDDR                                                                                               |
| <a href="#">IDDRX2DQ</a>  | DQ Input for DDR2 & DDR3 memory                                                                               |
| <a href="#">IDDRX4</a>    | Generic X4 IDDR                                                                                               |
| <a href="#">IDDRX4DQ</a>  | DQ Input for DDR3 memory                                                                                      |
| <a href="#">IDDRX5</a>    | Generic X5 IDDR                                                                                               |
| <a href="#">ODDR71</a>    | 7:1 LVDS ODDR                                                                                                 |
| <a href="#">ODDRX1</a>    | Generic X1 ODDR                                                                                               |
| <a href="#">ODDRX2</a>    | Generic X2 ODDR                                                                                               |
| <a href="#">ODDRX2DQ</a>  | DQ output for DDR2 & DDR3 memory                                                                              |
| <a href="#">ODDRX2DQS</a> | DQS Output for DDR2 & DDR3 memory                                                                             |
| <a href="#">ODDRX4</a>    | Generic X4 ODDR                                                                                               |
| <a href="#">ODDRX4DQ</a>  | DQ Input for DDR3 memory                                                                                      |
| <a href="#">ODDRX4DQS</a> | DQS Output for DDR3 memory                                                                                    |
| <a href="#">ODDRX5</a>    | Generic X5 ODDR                                                                                               |
| <a href="#">OSHX2</a>     | This primitive is used to generate the address and command for DDR3 memory with x2 gearing and write leveling |
| <a href="#">OSHX4</a>     | This primitive is used to generate the address and command for DDR3 memory with x4 gearing and write leveling |
| <a href="#">TSHX2DQ</a>   | DQ tristate control for DDR2 & DDR3 memory                                                                    |
| <a href="#">TSHX2DQS</a>  | DQS tristate control for DDR2 & DDR3 memory                                                                   |
| <a href="#">TSHX4DQ</a>   | DQ tristate control for DDR3 memory                                                                           |
| <a href="#">TSHX4DQS</a>  | DQS tristate control for DDR3 memory                                                                          |

**Table 10: Oscillators**

| Primitive            | Description      |
|----------------------|------------------|
| <a href="#">OSC</a>  | Oscillator Block |
| <a href="#">OSCA</a> | Oscillator Block |

**Table 11: Miscellaneous**

| <b>Primitive</b>             | <b>Description</b>                                                          |
|------------------------------|-----------------------------------------------------------------------------|
| <a href="#">ADC</a>          | Analog-to-Digital Converter                                                 |
| <a href="#">BNKREF18</a>     | Bank Reference Block for 1.8V I/O                                           |
| <a href="#">BUF</a>          | Non-Inverting Buffer                                                        |
| <a href="#">CRE</a>          | Cryptographic Engine                                                        |
| <a href="#">CONFIG_LMMI</a>  | LMMI (Lattice Memory Mapped Interface) interface to the configuration block |
| <a href="#">CONFIG_LMMIG</a> | LMMI (Lattice Memory Mapped Interface) interface to the configuration block |
| <a href="#">CONFIG_LMMIH</a> | LMMI (Lattice Memory Mapped Interface) interface to the configuration block |
| <a href="#">GSR</a>          | Global Set/Reset                                                            |
| <a href="#">INV</a>          | Inverter                                                                    |
| <a href="#">JTAG</a>         | JTAG Block for Reveal Debugging Tool                                        |
| <a href="#">TSALLA</a>       | Global Tristate Interface                                                   |
| <a href="#">VHI</a>          | Logic High Generator                                                        |
| <a href="#">VLO</a>          | Logic Low Generator                                                         |
| <a href="#">WDT</a>          | Interface for Configuration Watchdog Timer                                  |

# Primitive Library - LFMXO4 (MachXO4)

This library includes compatible primitives supported by the MachXO4 device family.

**Table 1: Flip-Flops**

| Primitive               | Description                                                                                           |
|-------------------------|-------------------------------------------------------------------------------------------------------|
| <a href="#">FD1P3AX</a> | Positive Edge Triggered D Flip-Flop with Positive Level Enable, GSR Used for Clear                    |
| <a href="#">FD1P3AY</a> | Positive Edge Triggered D Flip-Flop with Positive Level Enable, GSR Used for Preset                   |
| <a href="#">FD1P3BX</a> | Positive-Edge-Triggered D Flip-Flop with Positive-Level Enable and Positive-Level Asynchronous Preset |
| <a href="#">FD1P3DX</a> | Positive-Edge-Triggered D Flip-Flop with Positive-Level Enable and Positive-Level Asynchronous Clear  |
| <a href="#">FD1P3JX</a> | Positive-Edge-Triggered D Flip-Flop with Positive-Level Synchronous Preset and Positive-Level Enable  |
| <a href="#">FD1S3AX</a> | Positive Edge Triggered D Flip-Flop, GSR Used for Clear                                               |
| <a href="#">FD1S3AY</a> | Positive Edge Triggered D Flip-Flop, GSR Used for Preset                                              |
| <a href="#">FD1S3BX</a> | Positive Edge Triggered D Flip-Flop with Positive Level Asynchronous Preset                           |
| <a href="#">FD1S3DX</a> | Positive Edge Triggered D Flip-Flop with Positive Level Asynchronous Clear                            |
| <a href="#">FD1S3IX</a> | Positive Edge Triggered D Flip-Flop with Positive Level Synchronous Clear                             |
| <a href="#">FD1S3JX</a> | Positive Edge Triggered D Flip-Flop with Positive Level Synchronous Preset                            |

**Table 2: Input/Output Buffer**

| Primitive | Description                         |
|-----------|-------------------------------------|
| BB        | Bidirectional Buffer with Tri-state |
| IB        | Input Buffer                        |
| OB        | Output Buffer                       |
| OBZ       | Output Buffer with Tri-state        |

**Table 3: PIC Cells: Flip-Flops (Input)**

| Primitive | Description                                                                                                                                                                 |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IFS1P3BX  | Positive Edge Triggered D Flip-Flop with Positive Level Enable, Positive Level Asynchronous Preset, and System Clock (used in input PIC area only)                          |
| IFS1P3DX  | Positive Edge Triggered D Flip-Flop with Positive Level Enable, Positive Level Asynchronous Clear, and System Clock (used in input PIC area only)                           |
| IFS1P3IX  | Positive Edge Triggered D Flip-Flop with Positive Level Synchronous Clear, Positive Level Enable, and System Clock (Clear overrides Enable) (used in input PIC area only)   |
| IFS1P3JX  | Positive Edge Triggered D Flip-Flop with Positive Level Synchronous Preset, Positive Level Enable, and System Clock (Preset overrides Enable) (used in input PIC area only) |

**Table 4: PIC Cells: Flip-Flops (Output)**

| Primitive | Description                                                                                                                                                                  |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OFS1P3BX  | Positive Edge Triggered D Flip-Flop with Positive Level Enable, Positive Level Asynchronous Preset, and System Clock (used in output PIC area only)                          |
| OFS1P3DX  | Positive Edge Triggered D Flip-Flop with Positive Level Enable, Positive Level Asynchronous Clear, and System Clock (used in output PIC area only)                           |
| OFS1P3IX  | Positive Edge Triggered D Flip-Flop with Positive Level Synchronous Clear, Positive Level Enable (Clear overrides Enable), and System Clock (used in output PIC area only)   |
| OFS1P3JX  | Positive Edge Triggered D Flip-Flop with Positive Level Synchronous Preset, Positive Level Enable (Preset overrides Enable), and System Clock (used in output PIC area only) |

**Table 5: Memory**

| Primitive                | Description                      |
|--------------------------|----------------------------------|
| <a href="#">DP8KC</a>    | 8K True Dual Port Block RAM      |
| <a href="#">DPR16X4C</a> | Distributed Pseudo Dual Port RAM |
| <a href="#">FIFO8KB</a>  | 8K FIFO Block RAM                |
| <a href="#">PDPW8KC</a>  | Pseudo Dual Port Block RAM       |
| <a href="#">SP8KC</a>    | 8K Single Port Block RAM         |
| <a href="#">SPR16X4C</a> | Distributed Single Port RAM      |

**Table 6: Miscellaneous Logic**

| Primitive           | Description          |
|---------------------|----------------------|
| <a href="#">INV</a> | Inverter             |
| <a href="#">VHI</a> | Logic High Generator |
| <a href="#">VLO</a> | Logic Low Generator  |

**Table 7: Multiplexers**

| Primitive               | Description                            |
|-------------------------|----------------------------------------|
| <a href="#">L6MUX21</a> | 2 to 1 Mux                             |
| <a href="#">MUX21</a>   | 2-to-1 Mux                             |
| <a href="#">MUX41</a>   | 4 to 1 Mux                             |
| <a href="#">MUX81</a>   | 8 to 1 Mux                             |
| <a href="#">MUX161</a>  | 16-Input Mux within the PFU (4 Slices) |
| <a href="#">MUX321</a>  | 32-Input Mux within the PFU (8 Slices) |

**Table 8: Read-Only Memory**

| Primitive                 | Description                       |
|---------------------------|-----------------------------------|
| <a href="#">ROM128X1A</a> | ROM128X1A                         |
| <a href="#">ROM64X1A</a>  | 16 Word by 1 Bit Read-Only Memory |

**Table 8: Read-Only Memory**

| Primitive                 | Description                                                                             |
|---------------------------|-----------------------------------------------------------------------------------------|
| <a href="#">ROM256X1A</a> | 256 Word by 1 Bit Positive Edge Triggered Read-Only Memory with Registered Data Outputs |
| <a href="#">ROM32X1A</a>  | 32 Word by 1 Bit Read-Only Memory                                                       |
| <a href="#">ROM64X1A</a>  | 64 Word by 1 Bit Positive Edge Triggered Read-Only Memory with Registered Data Outputs  |

**Table 9: Clock/PLL/DLL**

| Primitive                    | Description                           |
|------------------------------|---------------------------------------|
| <a href="#">CLKDIVC</a>      | Clock Divider                         |
| <a href="#">DCCB</a>         | Dynamic Quadrant Clock Enable/Disable |
| <a href="#">DCMA</a>         | Dynamic Clock Mux                     |
| <a href="#">DLLDELC</a>      | Clock Shifting for ECLK or PCLK       |
| <a href="#">ECLKBRIDGECS</a> | ECLK Bridge Block Clock Select        |
| <a href="#">ECLKSYNCB</a>    | ECLK Stop Block                       |
| <a href="#">EHXPLLJ</a>      | GPLL                                  |
| <a href="#">OSCH</a>         | Oscillator                            |
| <a href="#">PLLREFCSB</a>    | PLL Dynamic Reference Clock Switching |

**Table 10: Combinatorial Primitives**

| Primitive            | Description           |
|----------------------|-----------------------|
| <a href="#">LUT4</a> | 4-Input Look-Up Table |
| <a href="#">LUT5</a> | 5-Input Look Up Table |
| <a href="#">LUT6</a> | 6-Input Look Up Table |
| <a href="#">LUT7</a> | 7-Input Look Up Table |
| <a href="#">LUT8</a> | 8-Input Look Up Table |

**Table 11: Dual Data Rate Cells**

| Primitive | Description                                 |
|-----------|---------------------------------------------|
| DQSDLLC   | Master DLL for Generating Required Delay    |
| IDDRXE    | Input for Generic DDR X1 Using 1:2 Gearing  |
| IDDRX2E   | Input for Generic DDR X2 Using 1:4 Gearing  |
| IDDRX4B   | Input for Generic DDR X4 Using 1:8 Gearing  |
| IDDRX71A  | 7:1 LVDS Input Supporting 1:7 Gearing       |
| ODDRXE    | Output for Generic DDR X1 Using 2:1 Gearing |
| ODDRX2E   | Output for Generic DDR X2 Using 4:1 Gearing |
| ODDRX4B   | Output for Generic DDR X4 Using 8:1 Gearing |
| ODDRX71A  | 7:1 LVDS Output                             |

**Table 12: Miscellaneous**

| Primitive | Description                                                                         |
|-----------|-------------------------------------------------------------------------------------|
| BCINRD    | Dynamic Bank Controller InRD                                                        |
| BCLVDSO   | Dynamic Bank Controller LVDS                                                        |
| CCU2D     | Carry Chain                                                                         |
| CLKFBBUFA | Dummy Feedback Delay Between PLL clk Output and PLL fb Port                         |
| DELAYG    | Delay                                                                               |
| DELAYH    | Fixed Delay in PIO                                                                  |
| EFB       | Embedded function blocks (EFB) interface with the user logic through a WISHBONE bus |
| GSRB      | Specifies the use of the global set/reset routing resources                         |
| INRDB     | Input Reference and Differential Buffer                                             |
| JTAGF     | JTAG (Joint Test Action Group) Controller                                           |
| LVDSOB    | LVDS Output Buffer                                                                  |
| PCNTR     | Power Controller                                                                    |
| SLICEMUX  | 2-Input Mux within the PFU, C0 Used for Selection with Positive Select              |
| PG        | Power Guard                                                                         |
| PUR       | Power Up Set/Reset                                                                  |
| SEDFA     | Soft Error Detect in Basic Mode                                                     |
| SEDFB     | Soft Error Detect in One Shot Mode                                                  |

**Table 12: Miscellaneous**

| Primitive             | Description                                    |
|-----------------------|------------------------------------------------|
| <a href="#">SGSRA</a> | Synchronous Release Global Set/Reset Interface |
| <a href="#">START</a> | Startup Controller                             |
| <a href="#">TSALL</a> | Global Tristate Interface                      |

# Primitive Library - LFMXO5 (MachXO5-NX)

This library includes compatible primitives supported by the LFMXO5 (MachXO5-NX) device family.

**Table 1: Adders/Subtractors**

| Primitive             | Description                |
|-----------------------|----------------------------|
| <a href="#">ACC54</a> | 54-bit Accumulator for DSP |

**Table 2: Flip-Flops**

| Primitive                | Description                                                                                                                                              |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">BFD1P3KX</a> | Positive Edge Triggered Bidirectional D-Flip Flop with Positive Level Enable and Synchronous Set/Reset for Input/Output/Tri-State Signals (to/from I/O)  |
| <a href="#">BFD1P3LX</a> | Positive Edge Triggered Bidirectional D-Flip Flop with Positive Level Enable and Asynchronous Set/Reset for Input/Output/Tri-State Signals (to/from I/O) |
| <a href="#">FD1P3BX</a>  | Positive Edge Triggered D Flip-Flop with Positive Level Enable and Positive Level Asynchronous Preset                                                    |
| <a href="#">FD1P3DX</a>  | Positive Edge Triggered D Flip-Flop with Positive Level Enable and Positive Level Asynchronous Clear                                                     |
| <a href="#">FD1P3IX</a>  | Positive Edge Triggered D Flip-Flop with Positive Level Synchronous Clear and Positive Level Enable (Clear overrides Enable)                             |
| <a href="#">FD1P3JX</a>  | Positive Edge Triggered D Flip-Flop with Positive Level Synchronous Preset and Positive Level Enable (Preset overrides Enable)                           |
| <a href="#">IFD1P3BX</a> | Positive Edge Triggered Input D Flip-Flop with Positive Level Enable and Positive Level Asynchronous Preset                                              |
| <a href="#">IFD1P3DX</a> | Positive Edge Triggered Input D Flip-Flop with Positive Level Enable and Positive Level Asynchronous Clear                                               |
| <a href="#">IFD1P3IX</a> | Positive Edge Triggered Input D Flip-Flop with Positive Level Synchronous Clear and Positive Level Enable (Clear overrides Enable)                       |

**Table 2: Flip-Flops**

| Primitive                | Description                                                                                                                           |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">IFD1P3JX</a> | Positive Edge Triggered Input D Flip-Flop with Positive Level Synchronous Preset and Positive Level Enable (Preset overrides Enable)  |
| <a href="#">OFD1P3BX</a> | Positive Edge Triggered Output D Flip-Flop with Positive Level Enable and Positive Level Asynchronous Preset                          |
| <a href="#">OFD1P3DX</a> | Positive Edge Triggered Output D Flip-Flop with Positive Level Enable and Positive Level Asynchronous Clear                           |
| <a href="#">OFD1P3IX</a> | Positive Edge Triggered Output D Flip-Flop with Positive Level Synchronous Clear and Positive Level Enable (Clear overrides Enable)   |
| <a href="#">OFD1P3JX</a> | Positive Edge Triggered Output D Flip-Flop with Positive Level Synchronous Preset and Positive Level Enable (Preset overrides Enable) |

**Table 3: Input/Output Buffer**

| Primitive                 | Description                                                  |
|---------------------------|--------------------------------------------------------------|
| <a href="#">BB</a>        | Bidirectional Buffer with Tri-State                          |
| <a href="#">BB_ADC</a>    | Bidirectional Buffer for Analog-to-Digital Converter         |
| <a href="#">BB_CDR</a>    | Bidirectional Buffer for CDR                                 |
| <a href="#">BB_I3C_A</a>  | Input/Output Buffer with User Controllable Pull-Up Resistors |
| <a href="#">DIFFIO18</a>  | Single Ended + Differential I/O block for 1.8V block         |
| <a href="#">DIFFIO18A</a> | Single Ended + Differential I/O block for 1.8V block         |
| <a href="#">IB</a>        | Input Buffer                                                 |
| <a href="#">OB</a>        | Output Buffer                                                |
| <a href="#">OBZ</a>       | Output Buffer with Tri-State                                 |
| <a href="#">SEIO18</a>    | Single Ended I/O block for 1.8V                              |
| <a href="#">SEIO18A</a>   | Single Ended I/O block for 1.8V                              |
| <a href="#">SEIO33</a>    | Single Ended I/O Block for 3.3V                              |

**Table 4: Memories**

| Primitive                | Description                                                                   |
|--------------------------|-------------------------------------------------------------------------------|
| <a href="#">DP16K</a>    | 16 kb Dual Port Block RAM                                                     |
| <a href="#">DPR16X4</a>  | Distributed Pseudo Dual Port RAM with Synchronous Write and Asynchronous Read |
| <a href="#">DPSC512K</a> | 512 kb Single Clock Dual Port Block RAM                                       |
| <a href="#">FIFO16K</a>  | 16 kb FIFO                                                                    |

**Table 4: Memories**

| Primitive                 | Description                                                              |
|---------------------------|--------------------------------------------------------------------------|
| <a href="#">PDP16K</a>    | 16 kb Pseudo Dual Port Block RAM                                         |
| <a href="#">PDPSC16K</a>  | 16 kb Pseudo Dual Port Single Clock Block RAM                            |
| <a href="#">PDPSC512K</a> | 512 kb Single Clock Pseudo Dual Port Block RAM                           |
| <a href="#">SP16K</a>     | 16 kb Single Port Block RAM                                              |
| <a href="#">SP512K</a>    | 512 kb Single Port Block RAM                                             |
| <a href="#">SPR16X4</a>   | Distributed Single Port RAM with Synchronous Write and Asynchronous Read |

**Table 5: Multipliers**

| Primitive                           | Description                                                                   |
|-------------------------------------|-------------------------------------------------------------------------------|
| <a href="#">ALUREG</a>              | Wrapper for Arithmetic Logic Unit and Register File for RISC-V Soft Processor |
| <a href="#">MULT18X18</a>           | 18x18 Multiplier with Optional Input/Output Registers                         |
| <a href="#">MULT18X36</a>           | 18x36 Multiplier with Optional Input/Output Registers                         |
| <a href="#">MULT36X36</a>           | 36x36 Multiplier with Optional Input/Output Registers                         |
| <a href="#">MULT9X9</a>             | 9x9 Multiplier with Optional Input/Output Registers                           |
| <a href="#">MULTADDSUB18X18</a>     | 18x18 Multiplier and Accumulator                                              |
| <a href="#">MULTADDSUB18X18WIDE</a> | 18x18 Wide Multiplier and Adder/Subtractor                                    |
| <a href="#">MULTADDSUB18X36</a>     | 18x36 Multiplier and Adder/Subtractor                                         |
| <a href="#">MULTADDSUB36X36</a>     | 36x36 Multiplier and Adder/Subtractor                                         |
| <a href="#">MULTADDSUB9X9WIDE</a>   | 9x9 Wide Multiplier and Adder/Subtractor                                      |
| <a href="#">MULTPREADD18X18</a>     | 18x18 Multiplier with Pre-Adder                                               |
| <a href="#">MULTPREADD9X9</a>       | 9x9 Multiplier with Pre-Adder                                                 |

**Table 6: Clock/PLL**

| Primitive                 | Description                                |
|---------------------------|--------------------------------------------|
| <a href="#">DCC</a>       | Dynamic Clock Control with Positive Enable |
| <a href="#">DCS</a>       | Dynamic Clock Selection                    |
| <a href="#">DIFFCLKIO</a> | Differential to single-end clock buffer.   |
| <a href="#">ECLKDIV</a>   | Clock Divider for Edge Clock Wrapper       |
| <a href="#">ECLKSYNC</a>  | Clock Synchronizer for Edge Clock Wrapper  |
| <a href="#">PCLKDIV</a>   | Clock Divider for Primary Clock            |

**Table 6: Clock/PLL**

| Primitive | Description                            |
|-----------|----------------------------------------|
| PCLKDIVSP | Clock Divider for Primary Clock        |
| PCSREFMUX | Multiplexer of reference clock for PCS |
| PLL       | Phase-Locked Loop                      |
| PLLA      | Phase-Locked Loop                      |
| PLLREFCS  | PLL Dynamic Reference Clock Switching  |

**Table 7: Combinatorial Primitives**

| Primitive | Description                       |
|-----------|-----------------------------------|
| CCU2      | Carry Chain                       |
| LUT4      | 4-Input Look Up Table             |
| WIDEFN9   | 9-Input Single Output Logic Block |

**Table 8: Interfaces**

| Primitive | Description                                                     |
|-----------|-----------------------------------------------------------------|
| I2CFIFO   | Hardened I2C Interface Block                                    |
| MIPI      | Soft MIPI Interface Block                                       |
| MULTIBOOT | Interface for Multiboot Functionality                           |
| PCIELL    | PCIe logical link layer                                         |
| PCSX1     | Wrapper of PCSX1 and MPCS                                       |
| PCSX4     | Wrapper of PCSX4 and MPCS                                       |
| SEDC      | Interface for Soft Error Detection and Correction Functionality |
| SGMIICDR  | Serial Gigabit Media Independent Interface                      |

**Table 9: Dual Data Rate Cells**

| Primitive | Description                                          |
|-----------|------------------------------------------------------|
| DDRDLL    | Delay-Locked Loop Master Block for DDR Functionality |
| DELAYA    | Dynamic Input/Output Delay Element                   |
| DELAYB    | Static Input/Output Delay Element                    |
| DELAYC    | Supports edge monitor feature                        |

**Table 9: Dual Data Rate Cells**

| Primitive    | Description                                                                                                   |
|--------------|---------------------------------------------------------------------------------------------------------------|
| DLLDEL       | Delay-Locked Loop Slave Block for DDR Functionality                                                           |
| DQSBUF       | Block generating DQS Signal for Memory DDR Functionality                                                      |
| DQSBUFA      | Block generating DQS Signal for Memory LPDDR4 Functionality                                                   |
| DQSBUF_IVREF | Block generating DQS Signal for Memory DDR4 Functionality                                                     |
| IDDR71       | 7:1 LVDS IDDR                                                                                                 |
| IDDRX1       | Generic X1 IDDR                                                                                               |
| IDDRX2       | Generic X1 IDDR                                                                                               |
| IDDRX2DQ     | DQ Input for DDR2 & DDR3 memory                                                                               |
| IDDRX4       | Generic X4 IDDR                                                                                               |
| IDDRX4DQ     | DQ Input for DDR3 memory                                                                                      |
| IDDRX5       | Generic X5 IDDR                                                                                               |
| ODDR71       | 7:1 LVDS ODDR                                                                                                 |
| ODDRX1       | Generic X1 ODDR                                                                                               |
| ODDRX2       | Generic X2 ODDR                                                                                               |
| ODDRX2DQ     | DQ output for DDR2 & DDR3 memory                                                                              |
| ODDRX2DQS    | DQS Output for DDR2 & DDR3 memory                                                                             |
| ODDRX4       | Generic X4 ODDR                                                                                               |
| ODDRX4DQ     | DQ Input for DDR3 memory                                                                                      |
| ODDRX4DQS    | DQS Output for DDR3 memory                                                                                    |
| ODDRX5       | Generic X5 ODDR                                                                                               |
| OSHX2        | This primitive is used to generate the address and command for DDR3 memory with x2 gearing and write leveling |
| OSHX4        | This primitive is used to generate the address and command for DDR3 memory with x4 gearing and write leveling |
| OUTDELAYA    | Add static and dynamic delay to DOUT and TOUT for write training in LPDDR4 mode.                              |
| OUTDELAYB    | Add static delay to DOUT and TOUT for write training in LPDDR4 mode.                                          |
| OUTDELAYC    | Add static and dynamic delay to DOUT and TOUT for write training in LPDDR4 mode.                              |
| TSHX2DQ      | DQ tristate control for DDR2 & DDR3 memory                                                                    |
| TSHX2DQS     | DQS tristate control for DDR2 & DDR3 memory                                                                   |
| TSHX4DQ      | DQ tristate control for DDR3 memory                                                                           |
| TSHX4DQS     | DQS tristate control for DDR3 memory                                                                          |

**Table 10: Oscillators**

| Primitive            | Description      |
|----------------------|------------------|
| <a href="#">OSC</a>  | Oscillator Block |
| <a href="#">OSCA</a> | Oscillator Block |

**Table 11: Miscellaneous**

| Primitive                    | Description                                                                 |
|------------------------------|-----------------------------------------------------------------------------|
| <a href="#">ADC</a>          | Analog-to-Digital Converter                                                 |
| <a href="#">BNKREF18</a>     | Bank Reference Block for 1.8V I/O                                           |
| <a href="#">BUF</a>          | Non-Inverting Buffer                                                        |
| <a href="#">CONFIG_LMMIB</a> | Includes Flash access through LMMI                                          |
| <a href="#">CONFIG_LMMIE</a> | LMMI (Lattice Memory Mapped Interface) interface to the configuration block |
| <a href="#">CONFIG_LMMIF</a> | LMMI (Lattice Memory Mapped Interface) interface to the configuration block |
| <a href="#">CRE</a>          | Cryptographic Engine                                                        |
| <a href="#">GSR</a>          | Global Set/Reset                                                            |
| <a href="#">INV</a>          | Inverter                                                                    |
| <a href="#">JTAG</a>         | JTAG Block for Reveal Debugging Tool                                        |
| <a href="#">TSALLA</a>       | Global Tristate Interface                                                   |
| <a href="#">VHI</a>          | Logic High Generator                                                        |
| <a href="#">VLO</a>          | Logic Low Generator                                                         |
| <a href="#">WDT</a>          | Interface for Configuration Watchdog Timer                                  |

## Primitive Library - LIFCL (CrossLink-NX)

This library includes compatible primitives supported by the LIFCL (CrossLink-NX) device family.

**Table 1: Adders/Subtractors**

| Primitive             | Description                |
|-----------------------|----------------------------|
| <a href="#">ACC54</a> | 54-bit Accumulator for DSP |

**Table 2: Flip-Flops**

| Primitive                | Description                                                                                                                                              |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">BFD1P3KX</a> | Positive Edge Triggered Bidirectional D-Flip Flop with Positive Level Enable and Synchronous Set/Reset for Input/Output/Tri-State Signals (to/from I/O)  |
| <a href="#">BFD1P3LX</a> | Positive Edge Triggered Bidirectional D-Flip Flop with Positive Level Enable and Asynchronous Set/Reset for Input/Output/Tri-State Signals (to/from I/O) |
| <a href="#">FD1P3BX</a>  | Positive Edge Triggered D Flip-Flop with Positive Level Enable and Positive Level Asynchronous Preset                                                    |
| <a href="#">FD1P3DX</a>  | Positive Edge Triggered D Flip-Flop with Positive Level Enable and Positive Level Asynchronous Clear                                                     |
| <a href="#">FD1P3IX</a>  | Positive Edge Triggered D Flip-Flop with Positive Level Synchronous Clear and Positive Level Enable (Clear overrides Enable)                             |
| <a href="#">FD1P3JX</a>  | Positive Edge Triggered D Flip-Flop with Positive Level Synchronous Preset and Positive Level Enable (Preset overrides Enable)                           |
| <a href="#">IFD1P3BX</a> | Positive Edge Triggered Input D Flip-Flop with Positive Level Enable and Positive Level Asynchronous Preset                                              |
| <a href="#">IFD1P3DX</a> | Positive Edge Triggered Input D Flip-Flop with Positive Level Enable and Positive Level Asynchronous Clear                                               |
| <a href="#">IFD1P3IX</a> | Positive Edge Triggered Input D Flip-Flop with Positive Level Synchronous Clear and Positive Level Enable (Clear overrides Enable)                       |

**Table 2: Flip-Flops**

| Primitive | Description                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------|
| IFD1P3JX  | Positive Edge Triggered Input D Flip-Flop with Positive Level Synchronous Preset and Positive Level Enable (Preset overrides Enable)  |
| OFD1P3BX  | Positive Edge Triggered Output D Flip-Flop with Positive Level Enable and Positive Level Asynchronous Preset                          |
| OFD1P3DX  | Positive Edge Triggered Output D Flip-Flop with Positive Level Enable and Positive Level Asynchronous Clear                           |
| OFD1P3IX  | Positive Edge Triggered Output D Flip-Flop with Positive Level Synchronous Clear and Positive Level Enable (Clear overrides Enable)   |
| OFD1P3JX  | Positive Edge Triggered Output D Flip-Flop with Positive Level Synchronous Preset and Positive Level Enable (Preset overrides Enable) |

**Table 3: Input/Output Buffer**

| Primitive   | Description                                          |
|-------------|------------------------------------------------------|
| BB          | Bidirectional Buffer with Tri-State                  |
| BB_ADC      | Single-Ended I/O Block for 1.8V                      |
| BB_CDR      | Single-Ended I/O Block for 1.8V                      |
| BB_I3C_A    | Single-Ended I/O Block for 3.3V                      |
| BB_PROGRAMN | Single-Ended I/O Block for PROGRAMN                  |
| DIFFIO18    | Single Ended + Differential I/O block for 1.8V block |
| IB          | Input Buffer                                         |
| OB          | Output Buffer                                        |
| OBZ         | Output Buffer with Tri-State                         |
| SEIO18      | Single Ended I/O block for 1.8V                      |
| SEIO33      | Single Ended I/O Block for 3.3V                      |

**Table 4: Memories**

| Primitive | Description                                                                   |
|-----------|-------------------------------------------------------------------------------|
| DP16K     | 16 kb Dual Port Block RAM                                                     |
| DPR16X4   | Distributed Pseudo Dual Port RAM with Synchronous Write and Asynchronous Read |
| DPSC512K  | 512 kb Single Clock Dual Port Block RAM                                       |
| FIFO16K   | 16 kb FIFO                                                                    |

**Table 4: Memories**

| Primitive                 | Description                                                              |
|---------------------------|--------------------------------------------------------------------------|
| <a href="#">PDP16K</a>    | 16 kb Pseudo Dual Port Block RAM                                         |
| <a href="#">PDPSC16K</a>  | 16 kb Pseudo Dual Port Single Clock Block RAM                            |
| <a href="#">PDPSC512K</a> | 512 kb Single Clock Pseudo Dual Port Block RAM                           |
| <a href="#">SP16K</a>     | 16 kb Single Port Block RAM                                              |
| <a href="#">SP512K</a>    | 512 kb Single Port Block RAM                                             |
| <a href="#">SPR16X4</a>   | Distributed Single Port RAM with Synchronous Write and Asynchronous Read |

**Table 5: Multipliers**

| Primitive                           | Description                                                       |
|-------------------------------------|-------------------------------------------------------------------|
| <a href="#">ALUREG</a>              | Arithmetic Logic Unit and Register File for RISC-V Soft Processor |
| <a href="#">MULT18X18</a>           | 18x18 Multiplier with Optional Input/Output Registers             |
| <a href="#">MULT18X36</a>           | 18x36 Multiplier with Optional Input/Output Registers             |
| <a href="#">MULT36X36</a>           | 36x36 Multiplier with Optional Input/Output Registers             |
| <a href="#">MULT9X9</a>             | 9x9 Multiplier with Optional Input/Output Registers               |
| <a href="#">MULTADDSUB18X18</a>     | 18x18 Multiplier and Accumulator                                  |
| <a href="#">MULTADDSUB18X18WIDE</a> | 18x18 Wide Multiplier and Adder/Subtractor                        |
| <a href="#">MULTADDSUB18X36</a>     | 18x36 Multiplier and Adder/Subtractor                             |
| <a href="#">MULTADDSUB36X36</a>     | 36x36 Multiplier and Adder/Subtractor                             |
| <a href="#">MULTADDSUB9X9WIDE</a>   | 9x9 Wide Multiplier and Adder/Subtractor                          |
| <a href="#">MULTPREADD18X18</a>     | 18x18 Multiplier with Pre-Adder                                   |
| <a href="#">MULTPREADD9X9</a>       | 9x9 Multiplier with Pre-Adder                                     |

**Table 6: Clock/PLL**

| Primitive                 | Description                                |
|---------------------------|--------------------------------------------|
| <a href="#">DCC</a>       | Dynamic Clock Control with Positive Enable |
| <a href="#">DCS</a>       | Dynamic Clock Selection                    |
| <a href="#">ECLKDIV</a>   | Clock Divider for Edge Clock Wrapper       |
| <a href="#">ECLKSYNC</a>  | Clock Synchronizer for Edge Clock Wrapper  |
| <a href="#">PCLKDIV</a>   | Clock Divider for Primary Clock            |
| <a href="#">PCLKDIVSP</a> | Clock Divider for Primary Clock            |

**Table 6: Clock/PLL**

| Primitive                | Description                           |
|--------------------------|---------------------------------------|
| <a href="#">PLL</a>      | Phase-Locked Loop                     |
| <a href="#">PLLA</a>     | Phase-Locked Loop                     |
| <a href="#">PLLREFCS</a> | PLL Dynamic Reference Clock Switching |

**Table 7: Combinatorial Primitives**

| Primitive               | Description                       |
|-------------------------|-----------------------------------|
| <a href="#">CCU2</a>    | Carry Chain                       |
| <a href="#">LUT4</a>    | 4-Input Look Up Table             |
| <a href="#">WIDEFN9</a> | 9-Input Single Output Logic Block |

**Table 8: Interfaces**

| Primitive                 | Description                                                     |
|---------------------------|-----------------------------------------------------------------|
| <a href="#">DPHY</a>      | Hardened MIPI DPHY Interface Block                              |
| <a href="#">I2CFIFO</a>   | Hardened I2C Interface Block                                    |
| <a href="#">MIPI</a>      | Soft MIPI Interface Block                                       |
| <a href="#">MULTIBOOT</a> | Interface for Multiboot Functionality                           |
| <a href="#">PCIE</a>      | Hardened PCIE Interface                                         |
| <a href="#">SEDC</a>      | Interface for Soft Error Detection and Correction Functionality |
| <a href="#">SGMIICDR</a>  | Serial Gigabit Media Independent Interface                      |

**Table 9: Dual Data Rate Cells**

| Primitive              | Description                                              |
|------------------------|----------------------------------------------------------|
| <a href="#">DDRDLL</a> | Delay-Locked Loop Master Block for DDR Functionality     |
| <a href="#">DELAYA</a> | Dynamic Input/Output Delay Element                       |
| <a href="#">DELAYB</a> | Static Input/Output Delay Element                        |
| <a href="#">DELAYC</a> | Supports edge monitor feature                            |
| <a href="#">DLLDEL</a> | Delay-Locked Loop Slave Block for DDR Functionality      |
| <a href="#">DQSBUF</a> | Block generating DQS Signal for Memory DDR Functionality |
| <a href="#">IDDR71</a> | 7:1 LVDS IDDR                                            |

**Table 9: Dual Data Rate Cells**

| Primitive | Description                                                                                                   |
|-----------|---------------------------------------------------------------------------------------------------------------|
| IDDRX1    | Generic X1 IDDR                                                                                               |
| IDDRX2    | Generic X1 IDDR                                                                                               |
| IDDRX2DQ  | DQ Input for DDR2 & DDR3 memory                                                                               |
| IDDRX4    | Generic X4 IDDR                                                                                               |
| IDDRX4DQ  | DQ Input for DDR3 memory                                                                                      |
| IDDRX5    | Generic X5 IDDR                                                                                               |
| ODDR71    | 7:1 LVDS ODDR                                                                                                 |
| ODDRX1    | Generic X1 ODDR                                                                                               |
| ODDRX2    | Generic X2 ODDR                                                                                               |
| ODDRX2DQ  | DQ output for DDR2 & DDR3 memory                                                                              |
| ODDRX2DQS | DQS Output for DDR2 & DDR3 memory                                                                             |
| ODDRX4    | Generic X4 ODDR                                                                                               |
| ODDRX4DQ  | DQ Input for DDR3 memory                                                                                      |
| ODDRX4DQS | DQS Output for DDR3 memory                                                                                    |
| ODDRX5    | Generic X5 ODDR                                                                                               |
| OSHX2     | This primitive is used to generate the address and command for DDR3 memory with x2 gearing and write leveling |
| OSHX4     | This primitive is used to generate the address and command for DDR3 memory with x4 gearing and write leveling |
| TSHX2DQ   | DQ tristate control for DDR2 & DDR3 memory                                                                    |
| TSHX2DQS  | DQS tristate control for DDR2 & DDR3 memory                                                                   |
| TSHX4DQ   | DQ tristate control for DDR3 memory                                                                           |
| TSHX4DQS  | DQS tristate control for DDR3 memory                                                                          |

**Table 10: Oscillators**

| Primitive | Description               |
|-----------|---------------------------|
| OSC       | Oscillator Block          |
| OSCA      | Oscillator Block          |
| OSCD      | High-frequency oscillator |
| OSCD      | High-frequency oscillator |
| OSHX2     | High-frequency oscillator |

**Table 11: Miscellaneous**

| Primitive    | Description                                                                 |
|--------------|-----------------------------------------------------------------------------|
| ADC          | Analog-to-Digital Converter                                                 |
| AON          | Always On                                                                   |
| AON          |                                                                             |
| AON          | Always On                                                                   |
| BNKREF18     | Bank Reference Block for 1.8V I/O                                           |
| BUF          | Non-Inverting Buffer                                                        |
| CRE          | Cryptographic Engine                                                        |
| CONFIG_LMMI  | LMMI (Lattice Memory Mapped Interface) interface to the configuration block |
| CONFIG_LMMIA | LMMI (Lattice Memory Mapped Interface) interface to the configuration block |
| GSR          | Global Set/Reset                                                            |
| INV          | Inverter                                                                    |
| JTAG         | JTAG Block for Reveal Debugging Tool                                        |
| TSALLA       | Global Tristate Interface                                                   |
| USB23        | The software interface of USB2.0 & USB3.0 hard IP                           |
| USB23        | USB23 Interface                                                             |
| USB23        | USB23 Interface                                                             |
| VHI          | Logic High Generator                                                        |
| VLO          | Logic Low Generator                                                         |
| WDT          | Interface for Configuration Watchdog Timer                                  |

# Primitive Library - iCE40UP (iCE40 UltraPlus)

This library includes compatible primitives supported by the iCE40UP (iCE40 UltraPlus) device family. For further information, a variety of technical notes for the iCE40 UltraPlus family are available on the Lattice website.

**Table 1: Adders/Subtractors**

| Primitive              | Description                                                                                             |
|------------------------|---------------------------------------------------------------------------------------------------------|
| <a href="#">CCU2_B</a> | Carry Chain.                                                                                            |
| <a href="#">FA2</a>    | Carry chain two bit full adder.<br>USER INSTANTIATION: Not Recommended; prefer RTL synthesis inference. |

**Table 2: Flip-Flops**

| Primitive               | Description                                                                                                                     |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">FD1P3BZ</a> | Positive edge triggered D flip-flop with positive level enable and positive level asynchronous preset.                          |
| <a href="#">FD1P3DZ</a> | Positive edge triggered D flip-flop with positive level enable and positive level asynchronous clear.                           |
| <a href="#">FD1P3IZ</a> | Positive edge triggered D flip-flop with positive level synchronous clear and positive level enable (clear overrides enable).   |
| <a href="#">FD1P3JZ</a> | Positive edge triggered D flip-flop with positive level synchronous preset and positive level enable (enable overrides preset). |
| <a href="#">FD1P3XZ</a> | Positive edge triggered D flip-flop with synchronous or asynchronous set/reset.                                                 |

**Table 3: Input/Output Buffer**

| Primitive              | Description                                                                                                      |
|------------------------|------------------------------------------------------------------------------------------------------------------|
| <a href="#">BB_B</a>   | Bidirectional I/O buffer with tri-state.                                                                         |
| <a href="#">IB</a>     | Input buffer.                                                                                                    |
| <a href="#">OB</a>     | Output buffer.                                                                                                   |
| <a href="#">OBZ_B</a>  | Output buffer with tristate.                                                                                     |
| <a href="#">OB_RGB</a> | Output Buffer.<br>USER INSTANTIATION: Illegal. Please refer to <a href="#">RGB</a> and <a href="#">RGB1P8V</a> . |

**Table 4: Memory**

| Primitive              | Description                                                                                                                                                                                                  |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">EBR_B</a>  | 4 Kb pseudo-dual port block ram with configurable write/read width & optional bitstream initialization.<br>USER INSTANTIATION: Not recommended; prefer either RTL synthesis inference or IP Generation Tool. |
| <a href="#">PDP4K</a>  | 4Kb pseudo-dual port block RAM.                                                                                                                                                                              |
| <a href="#">SP256K</a> | Single Port RAM that can be configured in 16K x 16 mode. This block can be cascaded using logic implemented in fabric to create larger memories.                                                             |
| <a href="#">VFB_B</a>  | 256Kb single port RAM.<br>USER INSTANTIATION: Not recommended. Please refer to <a href="#">SP256K</a> .                                                                                                      |

**Table 5: Multiplier**

| Primitive             | Description                                                                                                                   |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">MAC16</a> | DSP block capable of being configured as a multiplier, adder, subtractor, accumulator, multiply-adder or multiply-subtractor. |

**Table 6: PIC Cells**

| Primitive                | Description                                                           |
|--------------------------|-----------------------------------------------------------------------|
| <a href="#">IFD1P3AZ</a> | Positive edge triggered input D flip-flop with positive level enable. |
| <a href="#">IOL_B</a>    | Input/output registers, for both single data and double data rate.    |

## Special Cells

**Table 7: Clock/PLL**

| Primitive | Description                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------|
| PLL_B     | Phase locked loop. <b>For internal use.</b><br>USER INSTANTIATION: Not recommended; prefer IP Generation Tool. |

**Table 8: Combinatorial Primitives**

| Primitive | Description            |
|-----------|------------------------|
| LUT4      | 4-Input Look Up Table. |

**Table 9: Interfaces**

| Primitive | Description                                                     |
|-----------|-----------------------------------------------------------------|
| I2C_B     | The iCE40 UltraPlus device supports two I2C hard IP primitives. |
| BB_I3C    | I/O with user controllable pull up resistors.                   |
| SPI_B     | Hard SPI interface.                                             |

**Table 10: Oscillators**

| Primitive  | Description                                                                                                                                                                                                         |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HSOSC      | High-frequency oscillator. Generates 48MHz nominal clock, $\pm 10\%$ , with user programmable divider. Can drive global clock network or fabric routing.                                                            |
| HSOSC1P8V  | High-frequency oscillator. Generates 48MHz nominal clock, $\pm 10\%$ , with user programmable divider. Can drive global clock network or fabric routing. For use when VPP_2V5 is connected to a voltage below 2.3V. |
| I2C_B      | High-frequency oscillator. Generates 48MHz nominal clock, $\pm 10\%$ , with user programmable divider. Can drive global clock network or fabric routing.                                                            |
| LSOSC      | Low-frequency oscillator. Generates 10KHz nominal clock, $\pm 10\%$ . Can drive global clock network or fabric routing.                                                                                             |
| LSOSC1P8V  | Low-frequency oscillator. Generates 10KHz nominal clock, $\pm 10\%$ . Can drive global clock network or fabric routing. For use when VPP_2V5 is connected to a voltage below 2.3V.                                  |
| LSOSC_CORE | Low-frequency oscillator. Generates 10KHz nominal clock, $\pm 10\%$ . Can drive global clock network or fabric routing.                                                                                             |

**Table 11: Miscellaneous**

| Primitive | Description                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------|
| BB_OD     | Input/Output buffer.                                                                                                 |
| BUF       | Non-inverting buffer.<br>USER INSTANTIATION: Yes; refer to Template Editor.                                          |
| FILTER    | Adds a 50ns delay to a signal.                                                                                       |
| INV       | Inverter.                                                                                                            |
| OFD1P3AZ  | Positive edge triggered output D flip-flop with positive level enable.                                               |
| RGB       | RGB LED drive module, containing three open drain I/O pins for RGB LED outputs.                                      |
| RGB1P8V   | RGB LED drive module, containing three open drain I/O pins for RGB LED outputs.<br>Trim bits are driven from Fabric. |
| RGB_CORE  | RGB LED drive module, containing three open drain I/O pins for RGB LED outputs.                                      |
| RGBPWM    | Generates the PWM signals for the RGB LED drivers.                                                                   |
| VHI       | Logic High Generator.                                                                                                |
| VLO       | Logic Low Generator.                                                                                                 |
| WARMBOOT  | Allows for loading a different configuration during run time.                                                        |

## iCECube2 Primitives vs. Radiant Software Primitives

For complete information on updating iCECube2 Primitives for iCE40 UltraPlus devices to Radiant Software Primitives for iCE40 UltraPlus devices, refer to the [Migrating iCEcube2 iCE40 UltraPlus Designs to Lattice Radiant 2.0 Software](#) document.

# Alphanumeric Primitives List

This section lists all the Radiant library primitives in alphanumeric order.

## **ACC54**

54-bit Accumulator component for DSP

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 1: Input Ports**

| Name      | Range | Description                                              |
|-----------|-------|----------------------------------------------------------|
| SFTCTRL   | 3:0   | Arithmetical right shift 0 - 15                          |
| DSPIN     | 53:0  | Previous ACC54 data in                                   |
| PP        | 71:0  | Input form 4 groups of REG18                             |
| CIN[53:0] | 53:0  | Input form 4 groups of REG18                             |
| LOAD      | 1     | Dynamic load control for C register                      |
| M9ADDSUB  | 1:0   | Dynamic add/sub control for state 1 adder. 1=subtraction |
| ADDSUB    | 1:0   | Dynamic add/sub control for 54-bit adder                 |
| CIN       | 1     | Carry in from CIB                                        |
| CASIN     | 1:0   | Carry in from previous ACC54                             |
| CEO       | 1     | Clock enable for output register                         |
| RSTO      | 1     | Synchronous reset for output register                    |
| CEC       | 1     | Clock enable for C register                              |
| RSTC      | 1     | Synchronous reset for C register                         |
| CLK       | 1     | Clock for output register                                |
| SIGNEDI   | 1     | Signed input                                             |
| ROUNDEN   | 1     | 1=ACCU54 round enable                                    |

**Table 1: Input Ports (Continued)**

| Name    | Range | Description                                                |
|---------|-------|------------------------------------------------------------|
| CECIN   | 1     | Input carryin enable                                       |
| CECTRL  | 1     | Input control (addsub, m9addsub, signed, and loadc) enable |
| RSTCIN  | 1     | Input carryin reset                                        |
| RSTCTRL | 1     | Input control (addsub, m9addsub, signed, and loadc) reset  |

**Table 2: Output Ports**

| Name    | Range | Description                |
|---------|-------|----------------------------|
| SUM1    | 35:0  | Results Output to CIB      |
| SUM0    | 35:0  | Results Output to CIB      |
| DSPOUT  | 53:0  | Output to next ACC54       |
| CASCOUT | 1:0   | Carry output to next ACC54 |

**Table 3: Parameters**

| Name            | Values                                                                                                                                      | Description                                                |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------|
| SIGN            | "DISABLED" ( <i>default</i> )<br>"ENABLED"                                                                                                  | Static sign operation enable for ACCU54: Enable            |

## ADC

Wrapper for Analog-to-Digital Converter

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL-40,LIFCL-17
- ▶ UT24C
- ▶ UT24CP

**Table 4: Input Ports**

| Name    | Range | Description                                      |
|---------|-------|--------------------------------------------------|
| DN0     | 1     | Designated analog input positive ports           |
| DN1     | 1     | Designated analog input positive ports           |
| DP0     | 1     | Designated analog input negative ports           |
| DP1     | 1     | Designated analog input negative ports           |
| ADCEN   | 1     | Whole ADC enable signal                          |
| CAL     | 1     | ADC calibration control                          |
| CHAEN   | 1     | Channel A enable                                 |
| CHASEL  | 3:0   | Channel A ADC input selection                    |
| CHBEN   | 1     | Channel B enable                                 |
| CHBSEL  | 3:0   | Channel B ADC input selection                    |
| CLKDCLK | 1     | Clock input to ADC macro                         |
| CLKFAB  | 1     | Clock input from fabric                          |
| COMP1IN | 1     | First comparator positive external bonding input |

**Table 4: Input Ports (Continued)**

| Name     | Range | Description                                       |
|----------|-------|---------------------------------------------------|
| COMP1IP  | 1     | First comparator negative external bonding input  |
| COMP2IN  | 1     | Second comparator positive external bonding input |
| COMP2IP  | 1     | Second comparator negative external bonding input |
| COMP3IN  | 1     | Third comparator positive external bonding input  |
| COMP3IP  | 1     | Third comparator negative external bonding input  |
| CONVSTOP | 1     | Stop on-going conversion control                  |
| GPION    | 15:0  | Negative input ports                              |
| GPIOP    | 15:0  | Positive input ports                              |
| RESETN   | 1     | ADC hardware reset                                |
| RSTN     | 1     | Reset                                             |
| SOC      | 1     | Start of conversion                               |

**Table 5: Output Ports**

| Name    | Range | Description                 |
|---------|-------|-----------------------------|
| CALRDY  | 1     | End of calibration          |
| COG     | 1     | Conversion on-going signal  |
| COMP1OL | 1     | Comparator 1 latched output |
| COMP2OL | 1     | Comparator 2 latched output |
| COMP3OL | 1     | Comparator 3 latched output |
| DA      | 11:0  | 12-bit ADC channel A output |
| DB      | 11:0  | 12-bit ADC channel B output |
| EOC     | 1     | End of conversion           |
| COMP1O  | 1     | Comparator 1 output         |
| COMP2O  | 1     | Comparator 2 output         |
| COMP3O  | 1     | Comparator 3 output         |

**Table 6: Parameters**

| Name        | Values                                     | Description                        |
|-------------|--------------------------------------------|------------------------------------|
| ADC_ENP     | "ENABLED" ( <i>default</i> )<br>"DISABLED" | ADC enabling signal by MIB         |
| CLK_DIV     | "2" ( <i>default</i> )                     | DCLK divider control               |
| CTLCOMP SW1 | "DISABLED" ( <i>default</i> )<br>"ENABLED" | Internal comparator switch control |

**Table 6: Parameters (Continued)**

| Name        | Values                                                                 | Description                                                                                     |
|-------------|------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| CTLCOMP2SW2 | "DISABLED" (default)<br>"ENABLED"                                      | Internal comparator switch control                                                              |
| CTLCOMP2SW3 | "DISABLED" (default)<br>"ENABLED"                                      | Internal comparator switch control                                                              |
| DF          | "STRAIGHT_BINARY" (default)<br>"TWOS_COMPLEMENT"                       | Output data format control between straight binary and 2's complement coding                    |
| EN_COMP1    | "ENABLED" (default)<br>"DISABLED"                                      | Auxiliary Comparator 1 enable                                                                   |

| VREFBSEL    | "EXTERNAL" (default)<br>"INTERNAL"                                     | Channel B reference voltage input configuration between internal and external reference voltage |

LIFCL 17K devices have ADC usage restriction. GPIOP[4, 10, 11, 12, 15] and GPION[4, 10, 11, 12, 15] are not available.

The ADC macro is composed of two blocks: the external IP and its wrapper.

The external IP consists of two ADCs and three continuous-time comparators. Two ADCs convert unipolar or bipolar input signal into 12-bit resolution data with maximum 1MSPS (Mega Samples Per Second) conversion speed

sequentially or simultaneously. This XML covers the wrapper for ADC IP block.

## ALUREG

Wrapper for Arithmetic Logic Unit and Register File for RISC-V Soft Processor

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFMXO5TD
- ▶ LFMXO5T
- ▶ LIFCL-40,LIFCL-17
- ▶ UT24C
- ▶ UT24CP

**Table 7: Input Ports**

| Name        | Range | Description                            |
|-------------|-------|----------------------------------------|
| ALUCLK      | 1     | Input clock of ALU                     |
| ALUFORWARDA | 1     | ALU result forwarding to data_a enable |

**Table 7: Input Ports (Continued)**

| Name        | Range | Description                                                         |
|-------------|-------|---------------------------------------------------------------------|
| ALUFORWARDB | 1     | ALU result forwarding to data_b enable                              |
| ALUIREGEN   | 1     | ALU input register data update enable                               |
| ALUOREGEN   | 1i    | ALU output register data update enable                              |
| ALURST      | 1     | Active-high reset for ALU                                           |
| DATAA       | 31:0  | Data input of port-A of ALU                                         |
| DATAB       | 31:0  | Data input of port-B of ALU                                         |
| DATAAC      | 4:0   | Data input of port-C of ALU                                         |
| OPC         | 6:0   | Opcode of the ALU                                                   |
| OPCCUSTOM   | 1     | Enable signal for Lattice custom operation                          |
| RADDRA      | 4:0   | Read address port-A for reg-file                                    |
| RADDRB      | 4:0   | Read Address port-B for reg-file                                    |
| REGCLK      | 1     | Input clock of REG_FILE                                             |
| REGCLKEN    | 1     | Clock enable input for REG_FILE                                     |
| REGRST      | 1     | Active-high reset of REG_FILE                                       |
| WADDR       | 4:0   | Write Address for REG_FILE                                          |
| WDROTATE    | 1     | Write Data rotated per byte before writing into REG_FILE            |
| WDSIGNEXT   | 1     | If asserted, to sign extend the MSB bits of sized bytes             |
| WDSIZE      | 1     | Write Data size per byte after rotated before writing into REG_FILE |
| WDATA       | 31:0  | Write Data for REG_FILE                                             |
| WREN        | 1     | Write Enable for REG_FILE                                           |

**Table 8: Output Ports**

| Name     | Range | Description                                           |
|----------|-------|-------------------------------------------------------|
| ALUFLAGC | 1     | ALU arithmetic flag status of carry out/borrow in bit |
| ALUFLAGV | 1     | ALU arithmetic flag status of overflow bit            |
| ALUFLAGZ | 1     | ALU arithmetic flag status of result zero bit         |
| RDATAA   | 31:0  | Read Data from port-A of REG_FILE                     |
| RDATAB   | 31:0  | Read Data from port-B of REG_FILE                     |
| RESULT   | 31:0  | Output result from ALU                                |

**Table 9: Parameters**

| Name             | Values                            | Description                                                                      |
|------------------|-----------------------------------|----------------------------------------------------------------------------------|
| ALURST_ACTIVELOW | "DISABLE" (default)<br>"ENABLE"   | ALU reset active low                                                             |
| GSR              | "ENABLED" (default)<br>"DISABLED" | Global reset signal to reset all flops in ALUREG                                 |
| INREG            | "DISABLE" (default)<br>"ENABLE"   | Input registers of ALU                                                           |
| MULFXP_ROUND     | "ENABLED" (default)<br>"DISABLED" | Static config bit to enable FXP (fixed point) multiplication of half rounding up |
| OUTREG           | "DISABLE" (default)<br>"ENABLE"   | Control the output registers of ALU                                              |
| REGRST_ACTIVELOW | "DISABLE" (default)<br>"ENABLE"   | Active-low reset of REG_FILE                                                     |
| RETAIN           | "ENABLED" (default)<br>"DISABLED" | Data retained                                                                    |
| RFASYNC_RD       | "SYNC_RD" (default)<br>"ASYNC_RD" | Asynchronous read                                                                |
| RFR0_RO          | "R0READONLY" (default)            | Read-only register                                                               |
| RFUNALIA_WR      | "DISABLE" (default)<br>"ENABLE"   | Unaligned Write                                                                  |
| RFWCLK_INV       | "SIG" (default)<br>"INV"          | Invert the clk affecting only the writing into the REG_FILE                      |

## AON

Always On

Architectures supported:

- ▶ LIFCL-33U

**Table 10: Input Ports**

| Name       | Range | Description               |
|------------|-------|---------------------------|
| TESTMODEEN |       | Enable test mode          |
| CNTSET     | 15:0  | AON timer counting edges  |
| PRESLEEP   |       | FPGA ready to sleep       |
| AONINT     |       | External interrupt of AON |

**Table 11: Output Ports**

| Name         | Range | Description                                    |
|--------------|-------|------------------------------------------------|
| OSCCLK       |       | AON built in oscillator output                 |
| AONOUT       |       | AON output to control FPGA power               |
| PREAONOUT    |       | FPGA power down in test mode                   |
| REGRSTDEL    |       | Power down internal state signal for test mode |
| CNT1SEC      |       | Power down internal state signal for test mode |
| PWRDN        |       | Power down internal state signal for test mode |
| SIGISOEN     |       | Power down internal state signal for test mode |
| CLKISOEN     |       | Power down internal state signal for test mode |
| PRESLEEPREG  |       | Power down internal state signal for test mode |
| CNTSETREG    | 15:0  | Power down internal state signal for test mode |
| SETTLEREG1P8 |       | Power down internal state signal for test mode |
| TIEHIGH      |       | Power down internal state signal for test mode |

**BB**

Bidirectional Buffer with Tri-state

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ LN2-CT
- ▶ LFMXO4
- ▶ UT24C
- ▶ UT24CP

## BB\_CDR

Single-Ended I/O Block for 1.8V

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 22: Output Ports**

| Name  | Description   |
|-------|---------------|
| INADC | Output to ADC |

**Table 23: Bidirectional Ports**

| Name  | Description       |
|-------|-------------------|
| IOPAD | IO Pad connection |

## BB\_I3C

I/O with User Controllable Pull-Up Resistors

Architectures supported:

- ▶ iCE40 UltraPlus

**Table 24: Input Ports**

| Name        | Description                  |
|-------------|------------------------------|
| PU_ENB      | Pull-up enable               |
| WEAK_PU_ENB | Weak pull-up enable          |
| T_N         | Tri-state control active low |
| I           | Data to pad                  |

**Table 25: Output Ports**

| Name | Description   |
|------|---------------|
| O    | Data from pad |

**Table 26: Bidirectional Ports**

| Name | Description |
|------|-------------|
| B    | Pad         |

**Table 27: Parameters**

| Name     | Values                        |
|----------|-------------------------------|
| PULLMODE | "100K" ( <i>default</i> )     |
|          | "3P3K"                        |
|          | "6P8K"                        |
|          | "10K"                         |
|          | "NA"                          |
| IO_TYPE  | "LVCMOS33" ( <i>default</i> ) |
|          | "LVCMOS25"                    |
|          | "LVCMOS18"                    |
|          | "LVCMOS12"                    |
|          | "LVDSE"                       |

**Table 27: Parameters (Continued)**

| Name       | Values                                                                      |
|------------|-----------------------------------------------------------------------------|
| BANK_VCCIO | "3.3" ( <i>default</i> )<br>"2.5"<br>"1.8"<br>"1.2"                         |
| DRIVE      | "6" ( <i>default</i> )<br>"NA"<br>"2"<br>"4"<br>"6"<br>"10"<br>"12"<br>"16" |

LVDSE for BIDI may not be supported, but for stability-sake, better to leave it as an option to make it 1:1 with PIO physical cell model. LCT table will correctly stop LDVSE from going through for I3C.

## BB\_I3C\_A

Single-Ended I/O Block for 3.3V

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T

| 1      | 1   | Z       | Z             |

X = Don't care

U = Unknown

## BB\_PROGRAMN

Single-Ended I/O Block for PROGRAMN

Architectures supported:

▶ LIFCL-33

**Table 38: Input Ports**

| Name | Description       |
|------|-------------------|
| T    | Tri-state control |

**Table 39: Output Ports**

| Name | Description   |
|------|---------------|
| O    | Data from pad |

**Table 40: Truth Table**

| Output | Description                                 |
|--------|---------------------------------------------|
| T = 0  | Reset the PROGRAMN FPGA.                    |
| T = 1  | Release reset that allows the FPGA to boot. |

**Figure 1: BB\_PROGRAMN Diagram**

## BCINRD

Dynamic Bank Controller InRD

Architectures Supported:

► LFMXO4

**Table 41: Input Ports**

| Name    | Range | Description                                    |
|---------|-------|------------------------------------------------|
| INRDENI | 1     | Dynamic signal to enable and disable bank InRD |

**Table 42: Parameters**

| Name   | Values                                    | Description                                        |
|--------|-------------------------------------------|----------------------------------------------------|
| BANKID | "0" (default),<br>"1", "2", "3", "4", "5" | Bank ID to indicate the control of a specific bank |

### Description

The dynamic bank controller is used to power down banks InRD (Input Referenced and Differential) and LVDS outputs. The dynamic bank controller is represented with two primitives: BCINRD and [BCLVDSO](#). The INRDENI input is the dynamic signal to enable and disable bank InRD.

For more information, refer to related technical notes on the Lattice web site:

## BCLVDSO

Dynamic Bank Controller LVDS

Architectures Supported:

► LFMXO4

**Table 43: Input Ports**

| Name    | Range | Description                                    |
|---------|-------|------------------------------------------------|
| LVDSENI | 1     | Dynamic signal to enable and disable bank InRD |

**Description**

The dynamic bank controller is used to power down banks InRD (Input Referenced and Differential) and LVDS outputs. The dynamic bank controller is represented with two primitives: BCLVDSO and [BCINRD](#). The LVDSENI input is the dynamic signal to enable and disable bank InRD.

For more information, refer to related technical notes on the Lattice web site:

**BFD1P3KX**

Positive Edge Triggered Bidirectional D Flip-Flop with Positive Level Enable and Synchronous Set/Reset for Input/Output/Tri-state Signals (to/from IO)

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 44: Input Ports**

| Name   | Description                                |
|--------|--------------------------------------------|
| DOUT   | Data out from fabric                       |
| DIN    | Data in from I/O                           |
| DT     | Tri-state in from fabric                   |
| CEOUT  | Output/Tri-state clock enable, active high |
| CLKOUT | Output/Tri-state clock                     |
| SROUT  | Output/Tri-state set/reset                 |
| CEIN   | Input clock enable, active high            |
| CLKIN  | Input clock                                |
| SRIN   | Input set/reset                            |

**Table 45: Output Ports**

| Name | Description         |
|------|---------------------|
| QOUT | Data out to IO      |
| QIN  | Data in to fabric   |
| QT   | Tri-state out to IO |

**Table 46: Parameters**

| Name   | Values                            | Description                                               |
|--------|-----------------------------------|-----------------------------------------------------------|
| GSR    | "ENABLED" (default)<br>"DISABLED" | Enable global set/reset                                   |
| OUTSET | "RESET" (default)<br>"SET"        | Controls the set/reset behavior of the output register    |
| INSET  | "RESET" (default)<br>"SET"        | Controls the set/reset behavior of the input register     |
| TSSET  | "RESET" (default)<br>"SET"        | Controls the set/reset behavior of the tri-state register |

When INSET/OUTSET/TSSET = "SET", truth table is the same as \*FD1P3JX.

When INSET/OUTSET/TSSET = "RESET", truth table is the same as \*FD1P3IX.

CEOUT/CEIN, SROUT/SRIN, CLKOUT/CLKIN must be driven by the same signal, with the exception that they may be driven by the logical inversion of one another.

## BFD1P3LX

Positive Edge Triggered Bidirectional D Flip-Flop with Positive Level Enable and Asynchronous Set/Reset, for Input/Output/Tri-state Signals (to/from IO)

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C

▶ UT24CP

**Table 47: Input Ports**

| Name   | Description                                |
|--------|--------------------------------------------|
| DOUT   | Data out from fabric                       |
| DIN    | Data in from I/O                           |
| DT     | Tri-state in from fabric                   |
| CEOUT  | Output/Tri-state clock enable, active high |
| CLKOUT | Output/Tri-state clock                     |
| SROUT  | Output/Tri-state set/reset                 |
| CEIN   | Input clock enable, active high            |
| CLKIN  | Input clock                                |
| SRIN   | Input set/reset                            |

**Table 48: Output Ports**

| Name | Description         |
|------|---------------------|
| QOUT | Data out to IO      |
| QIN  | Data in to fabric   |
| QT   | Tri-state out to IO |

**Table 49: Parameters**

| Name   | Values                                     | Description                                            |
|--------|--------------------------------------------|--------------------------------------------------------|
| GSR    | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable global set/reset                                |
| OUTSET | "RESET" ( <i>default</i> )<br>"SET"        | Controls the set/reset behavior of the output register |

**Table 49: Parameters (Continued)**

| Name  | Values                     | Description                                               |
|-------|----------------------------|-----------------------------------------------------------|
| INSET | "RESET" (default)<br>"SET" | Controls the set/reset behavior of the input register     |
| TSSET | "RESET" (default)<br>"SET" | Controls the set/reset behavior of the tri-state register |

When INSET/OUTSET/TSSET = "SET", truth table is the same as \*FD1P3BX.

When INSET/OUTSET/TSSET = "RESET", truth table is the same as \*FD1P3DX.

CEOUT/CEIN, SROUT/SRIN, CLKOUT/CLKIN must be driven by the same signal, with the exception that they may be driven by the logical inversion of one another.

## BNKREF18

Bankref Block for IOS18

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX

- ▶ LFMXO5
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 50: Input Ports**

| Name     | Description                                 |
|----------|---------------------------------------------|
| STDBYINR | Standby inr to BANKREF: 0: standby; 1: work |
| STDBYDIF | CIB standby signal to SLVS/LVDS biases      |

**Table 51: Output Ports**

| Name    | Description                            |
|---------|----------------------------------------|
| PVTCODE | Process, Voltage, and Temperature Code |

**Table 52: Parameters**

| Name           | Values                            | Description                                               |
|----------------|-----------------------------------|-----------------------------------------------------------|
| BANK           | "0'b0000" (default)               | Virtual attribute, used to tell placer where to place it. |
| STANDBY_DIFFIO | "DISABLED" (default)<br>"ENABLED" | Enables SLVS/LVDS output standby mode                     |
| STANDBY_INR    | "DISABLED" (default)<br>"ENABLED" | Enables INR standby mode: 0 off; 1 on                     |

## BUF

Non-Inverting Buffer

Architectures supported:

- ▶ iCE40 UltraPlus

- ▶ LAV-AT-ES1
- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO4
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ LN2-CT
- ▶ UT24C
- ▶ UT24CP

**Table 53: Input Ports**

| Name | Description          |
|------|----------------------|
| A    | BUF function input A |

**Table 54: Output Ports**

| Name | Description  |
|------|--------------|
| Z    | BUF output Z |

## CCU2

Carry Chain

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65

- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 55: Input Ports**

| Name | Description                        |
|------|------------------------------------|
| A0   | Input bit 0 for non-operand signal |
| B0   | Input bit 0 of the first operand   |
| C0   | Input bit 0 of the second operand  |
| D0   | Input bit 0 of the third operand   |
| A1   | Input bit 1 for non-operand signal |
| B1   | Input bit 1 of the first operand   |
| C1   | Input bit 1 of the second operand  |
| D1   | Input bit 1 of the third operand   |
| CIN  | Carry in                           |

**Table 56: Output Ports**

| Name | Description             |
|------|-------------------------|
| S0   | Output bit 0 of the sum |
| S1   | Output bit 1 of the sum |
| COUT | Carry out               |

**Table 57: Parameters**

| Name   | Values             | Description           |
|--------|--------------------|-----------------------|
| INIT0  | "0x0000" (default) | Initialization data 0 |
| INIT1  | "0x1111" (default) | Initialization data 1 |
| INJECT | "YES" (default)    | Inject                |

## CCU2\_B

Carry Chain

Architectures supported:

- ▶ iCE40 UltraPlus

**Table 58: Input Ports**

| Name | Description                        |
|------|------------------------------------|
| A0   | Input bit 0 for non-operand signal |
| B0   | Input bit 0 of the first operand   |
| C0   | Input bit 0 of the second operand  |
| CIN  | Carry in                           |

| 1      | 0  | 1  | 0  | 1   | 0       | 1  | 1    |
| 1      | 0  | 1  | 1  | 0   | 0       | 1  | 1    |
| 1      | 0  | 1  | 1  | 1   | 1       | 0  | 1    |
| 1      | 1  | 0  | 0  | 0   | 1       | 1  | 0    |
| 1      | 1  | 0  | 0  | 1   | 0       | 0  | 1    |
| 1      | 1  | 0  | 1  | 0   | 0       | 0  | 1    |
| 1      | 1  | 0  | 1  | 1   | 0       | 1  | 1    |
| 1      | 1  | 1  | 0  | 0   | 0       | 1  | 1    |
| 1      | 1  | 1  | 0  | 1   | 1       | 0  | 1    |
| 1      | 1  | 1  | 1  | 0   | 1       | 0  | 1    |
| 1      | 1  | 1  | 1  | 1   | 1       | 1  | 1    |

**Note:**

This is the truth table for an example full adder using CCU2\_B. B1, B0 and C1, C0 are used as operands, while A1, A0 are not used and are tied to ground.

**Rules & Restrictions**

COUT can only go to D input of LUT above it or next CIN.

To drive VHI to the carry-in “half” a CCU2 must be used. This is done by driving B0 or C0 or both (if S0 can be a don’t care value) to VHI and leaving CIN floating. Your real CCU2 will then start with B1, C1 and the carry-in will be VHI.

To drive VLO to the carry-in “half” a CCU2 must be used. This is done by driving VLO for B0 and C0 and leaving CIN floating. Your real CCU2 starts with B1, C1 and CIN1 will be driven by VLO.

If you want to bring out last COUT to fabric, simply connect COUT to whatever is your fabric logic. MAP and Placer will work to insert a LUT and

place it in the appropriate location automatically (thus ensuring rule 1 is followed).

See examples below that takes into account the above rules.

---

**Note:**

The examples below do not make use of the A0 or A1 ports as they are not needed for carry-chain functionality.

---

**Burning half a CCU2 for carry-chain:**

```
CCU2_B counter_12_add_4_0 (  
    .B0(GND_net),  
    .C0(GND_net),  
    .CIN(),  
    .B1(firstB),  
    .C1(firstC),  
    .COUT(firstCarry),  
    .S0(),  
    .S1(firstSum)  
);
```

**Using LUT to bring last Carry Out:**

```
CCU2_B counter_12_add_4_7 (  
    .B0(GND_net),  
    .C0(out_c_5),  
    .CIN(COUT_prev),  
    .B1(GND_net),  
    .C1(out_c_6),  
    .COUT(LAST_CARRY),  
    .S0(n40),  
    .S1(n39)  
);  
  
LUT lutInst(  
    .D(LAST_CARRY),  
    .F(CARRYOUT_TO_FABRIC)  
); //eqn : F=D
```

**Using CCU2 to bring last Carry Out:**

**Why it works:** Last Sum = GND XOR GND XOR CIN\_PREV = lastCarryOut.

```
CCU2_B counter_12_add_4_9 (  
    .B0(GND_net),  
    .C0(out_c_7),  
    .CIN(COUT_prev),  
    .B1(GND_net),  
    .C1(GND_net),  
    .COUT(),  
    .S0(n40),  
    .S1(lastCarryOut)  
);
```

## CCU2C

Carry Chain

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 62: Input Ports**

| Name | Type    | Description       |
|------|---------|-------------------|
| A1   | Data    | Function input A1 |
| B1   | Data    | Function input B1 |
| C1   | Control | Function input C1 |
| D1   | Control | Function input D1 |
| A0   | Data    | Function input A0 |
| B0   | Data    | Function input B0 |
| C0   | Control | Function input C0 |
| D0   | Control | Function input D0 |
| CIN  | Control | Carry in          |

**Table 63: Output Ports**

| Name | Description  |
|------|--------------|
| COUT | Carry out    |
| S1   | Sum 1 output |
| S0   | Sum 0 output |

**Table 64: Parameters**

| Name    | Values                  | Description                |
|---------|-------------------------|----------------------------|
| INJECT0 | "YES" (default)<br>"NO" | INJECT0                    |
| INJECT1 | "YES" (default)<br>"NO" | INJECT1                    |
| INIT0   | "0x0000" (default)      | CCU2 initialization data 0 |
| INIT1   | "0x1111" (default)      | CCU2 initialization data 1 |

- ▶ At the beginning of the carry chain, CIN must always be tied to a constant 0.
- ▶ At the beginning of the carry chain, if a CIN is desired (either a constant 1 or a live signal), use one of the A/B/C/D pins and adjust the INIT equation accordingly.
- ▶ At the beginning of the carry chain, CIN is a "don't care", but it MUST be connected to low for synthesis netlist purpose. All the inputs must have known values.
- ▶ In Avant, it is not required to consume a half-slice at the beginning of the carry chain. If the CIN is desired (either constant or a live signal), use the C0 pin and adjust the INIT0 equation as provided in the table for first bit.
- ▶ In general, COUT must only drive CIN except at the end of a shift chain. At the end of a chain, COUT may connect directly to other design logic. If the chain ends halfway through a CCU2, the carry out value may be brought out through S1 by setting INIT1 to 0x000.

#### Logical Diagram of CCU2C

## CCU2D

Carry Chain

Architectures Supported:

▶ LFMXO4

**Table 65: Input Ports**

| Name | Range | Description                        |
|------|-------|------------------------------------|
| CIN  | 1     | Carry in                           |
| A1   | 1     | Input bit 1 for non-operand signal |
| B1   | 1     | Input bit 1 of the first operand   |
| C1   | 1     | Input bit 1 of the second operand  |

**Table 65: Input Ports**

| Name | Range | Description                        |
|------|-------|------------------------------------|
| D1   | 1     | Function input D1                  |
| A0   | 1     | Input bit 0 for non-operand signal |
| B0   | 1     | Input bit 0 of the first operand   |
| C0   | 1     | Function input C0                  |
| D0   | 1     | Function input D0                  |

**Table 66: Output Ports**

| Name | Range | Description             |
|------|-------|-------------------------|
| S1   | 1     | Output bit 1 of the sum |
| S0   | 1     | Output bit 0 of the sum |
| COUT | 1     | Carry out               |

**Table 67: Parameters**

| Name      | Values   | Description                 |
|-----------|----------|-----------------------------|
| INIT0     | "0x0000" | CCU2D initialization data 0 |
| INIT1     | "0x0000" | CCU2D initialization data 1 |
| INJECT1_0 | "YES"    | INJECT0                     |
| INJECT1_1 | "YES"    | INJECT1                     |

## CLKDIVC

Clock Divider

Architectures Supported:

▶ LFMXO4

**Table 68: Input Ports**

| Name    | Range | Description                                                                                                                  |
|---------|-------|------------------------------------------------------------------------------------------------------------------------------|
| RST     | 1     | Asserting the RST signal asynchronously forces all outputs low. De-asserting RST synchronously allows all outputs to toggle. |
| CLKI    | 1     | Input clock.                                                                                                                 |
| ALIGNWD | 1     | This signal is used for word alignment.                                                                                      |

**Table 69: Output Ports**

| Name  | Range | Description                             |
|-------|-------|-----------------------------------------|
| CDIVX | 1     | Divide by 2.0, 3.5, or 4.0 output port. |
| CDIV  | -1:1  | Divide by 1 output port.                |

The CLKDIV, or “clock divider” block, generates clock outputs one half, divided by three and a half or one quarter of the frequency of the input clock. It also generates an output clock of the same frequency as the input clock. All the outputs match input to output delay.

CLKDIV takes its inputs from the outputs of ECLK muxes. The divided outputs of the CLKDIV drive the primary clock center muxes directly and are also available on CIB ports for distribution to routing or secondary high fan out nets. The figure below represents the block diagram of CLKDIV:

## CLKFBBUFA

Dummy Feedback Delay Between PLL clk Output and PLL fb Port

Architectures Supported:

- ▶ LFMXO4

CLKFBBUFA

Table 70: Input Ports

| Name | Range | Description                                  |
|------|-------|----------------------------------------------|
| A    | 1     | Clock input coming from the PLL CLKOP output |

Table 71: Output Ports

| Name | Range | Description                       |
|------|-------|-----------------------------------|
| Z    | 1     | Delayed output to the PLL fb port |

### Description

The CLKFBBUFA is the dummy feedback path from the PLL clk output to the PLL feedback port to cancel out clock path variation over PVT.

## CONFIG\_DONE

CONFIG final done status

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

CONFIG\_DONE

**Table 72: Output Ports**

| Name    | Description              |
|---------|--------------------------|
| CFGDONE | CONFIG final done status |

## CONFIG\_LMMI

LMMI (Lattice Memory Mapped Interface) interface to the configuration block

Architectures supported:

- ▶ LFD2NX

**Table 73: Input Ports**

| Name            | Description               |
|-----------------|---------------------------|
| LMMICLK         | Clock for LMMI interface  |
| LMMIREQUEST     | Start transaction         |
| LMMIWRRD_N      | 1=write, 0=read           |
| LMMIOFFSET[7:0] | Register offset           |
| LMMIWDATA[7:0]  | Write data                |
| LMMIRESETN      | Reset the LMMI interface  |
| RSTSMCLK        | Reset SMCLK               |
| SMCLK           | Configuration block clock |

**Table 74: Output Ports**

| Name           | Description                                                    |
|----------------|----------------------------------------------------------------|
| LMMIRDATA[7:0] | Read data                                                      |
| LMMIREADY      | LMMI ready signal                                              |
| LMMIRDATAVALID | Read transaction is complete and LMMIRDATA contains valid data |

**Table 75: Parameters**

| Name    | Values                  | Description               | Inferable |
|---------|-------------------------|---------------------------|-----------|
| LMMI_EN | "DIS" (default)<br>"EN" | Enable the LMMI interface | No        |

## CONFIG\_LMMIA

LMMI (Lattice Memory Mapped Interface) interface to the configuration block

Architectures supported:

- ▶ LFCPNX
- ▶ LIFCL-33, LIFCL-33U
- ▶ UT24CP

### CONFIG\_LMMIA

**Table 76: Input Ports**

| Name            | Description               |
|-----------------|---------------------------|
| LMMICK          | Clock for LMMI interface  |
| LMMIREQUEST     | Start transaction         |
| LMMIWRRD_N      | 1=write, 0=read           |
| LMMIOFFSET[7:0] | Register offset           |
| LMMIWDATA[7:0]  | Write data                |
| LMMIRESETN      | Reset the LMMI interface  |
| RSTSMCLK        | Reset SMCLK               |
| SMCLK           | Configuration block clock |

**Table 77: Output Ports**

| Name           | Description                                                    |
|----------------|----------------------------------------------------------------|
| LMMIRDATA[7:0] | Read data                                                      |
| LMMIREADY      | LMMI ready signal                                              |
| LMMIRDATAVALID | Read transaction is complete and LMMIRDATA contains valid data |

**Table 78: Parameters**

| Name    | Values                  | Description               | Inferable |
|---------|-------------------------|---------------------------|-----------|
| LMMI_EN | "DIS" (default)<br>"EN" | Enable the LMMI interface | No        |

## CONFIG\_LMMIB

Includes Flash access through LMMI

Architectures supported:

- ▶ LFMXO5-25

**Table 79: Input Ports**

| Name        | Description              |
|-------------|--------------------------|
| LMMICKL     | Clock for LMMI interface |
| LMMIREQUEST | Start transaction        |
| LMMIWRRD_N  | 1=write, 0=read          |
| LMMIOFFSET  | Register offset          |
| LMMIWDATA   | Write data               |

**Table 80: Output Ports**

| Name           | Description                                                    |
|----------------|----------------------------------------------------------------|
| LMMIRDATA      | Read data                                                      |
| LMMIREADY      | LMMI ready signal                                              |
| LMMIRDATAVALID | Read transaction is complete and LMMIRDATA contains valid data |

**Table 81: Parameters**

| Name    | Values                  | Description               |
|---------|-------------------------|---------------------------|
| LMMI_EN | "DIS" (default)<br>"EN" | Enable the LMMI interface |

## CONFIG\_LMMIC

LMMI Slave Primitive

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT-10

**CONFIG\_LMMIC****Table 82: Input Ports**

| Name        | Range | Description       |
|-------------|-------|-------------------|
| LMMICLK     | 1     | LMMI Clock        |
| LMMIRESET_N | 1     | LMMI Resetn       |
| LMMIREQUEST | 1     | LMMI Request      |
| LMMIWRRDN   | 1     | LMMI Write Enable |
| LMMIOFFSET  | 7:0   | LMMI Offset       |
| LMMIWDATA   | 15:0  | LMMI Write Data   |

**Table 83: Output Ports**

| Name           | Range | Description          |
|----------------|-------|----------------------|
| LMMIRDATA      | 15:0  | LMMI Read Data       |
| LMMIRDATAVALID | 1     | LMMI Read Data Valid |
| LMMIREADY      | 1     | LMMI Slave Ready     |

**CONFIG\_LMMIE**

LMMI (Lattice Memory Mapped Interface) interface to the configuration block

Architectures supported:

- ▶ LFMXO5-100T

**Table 84: Input Ports**

| Name            | Description               |
|-----------------|---------------------------|
| LMMICLK         | Clock for LMMI interface  |
| LMMIREQUEST     | Start transaction         |
| LMMIWRRD_N      | 1=write, 0=read           |
| LMMIOFFSET[7:0] | Register offset           |
| LMMIWDATA[7:0]  | Write data                |
| LMMIRESETN      | Reset the LMMI interface  |
| RSTSMCLK        | Reset SMCLK               |
| SMCLK           | Configuration block clock |

**Table 85: Output Ports**

| Name           | Description                                                    |
|----------------|----------------------------------------------------------------|
| LMMIRDATA[7:0] | Read data                                                      |
| LMMIREADY      | LMMI ready signal                                              |
| LMMIRDATAVALID | Read transaction is complete and LMMIRDATA contains valid data |

**Table 86: Parameters**

|---------|-------------------------|---------------------------|-----------|
| LMMI_EN | "DIS" (default)<br>"EN" | Enable the LMMI interface | No        |

## CONFIG\_LMMIF

LMMI (Lattice Memory Mapped Interface) interface to the configuration block

Architectures supported:

- ▶ LFMXO5-35T
- ▶ LFMXO5-65T

**Table 87: Input Ports**

| Name            | Description              |
|-----------------|--------------------------|
| LMMICLK         | Clock for LMMI interface |
| LMMIREQUEST     | Start transaction        |
| LMMIWRRD_N      | 1=write, 0=read          |
| LMMIOFFSET[7:0] | Register offset          |
| LMMIWDATA[7:0]  | Write data               |
| LMMIRESETN      | Reset the LMMI interface |

**Table 88: Output Ports**

| Name           | Description                                                    |
|----------------|----------------------------------------------------------------|
| LMMIRDATA[7:0] | Read data                                                      |
| LMMIREADY      | LMMI ready signal                                              |
| LMMIRDATAVALID | Read transaction is complete and LMMIRDATA contains valid data |

**Table 89: Parameters**

| Name    | Values                  | Description               | Inferable |
|---------|-------------------------|---------------------------|-----------|
| LMMI_EN | "DIS" (default)<br>"EN" | Enable the LMMI interface | No        |

## CONFIG\_LMMIG

LMMI (Lattice Memory Mapped Interface) interface to the configuration block

Architectures supported:

- ▶ LFD2NX-15
- ▶ LFD2NX-25

**Table 90: Input Ports**

| Name            | Description              |
|-----------------|--------------------------|
| LMMICK          | Clock for LMMI interface |
| LMMIREQUEST     | Start transaction        |
| LMMIWRRD_N      | 1=write, 0=read          |
| LMMIOFFSET[7:0] | Register offset          |
| LMMIWDATA[7:0]  | Write data               |
| LMMIRESETN      | Reset the LMMI interface |

**Table 91: Output Ports**

| Name           | Description                                                    |
|----------------|----------------------------------------------------------------|
| LMMIRDATA[7:0] | Read data                                                      |
| LMMIREADY      | LMMI ready signal                                              |
| LMMIRDATAVALID | Read transaction is complete and LMMIRDATA contains valid data |

**Table 92: Parameters**

| Name    | Values                  | Description               | Inferable |
|---------|-------------------------|---------------------------|-----------|
| LMMI_EN | "DIS" (default)<br>"EN" | Enable the LMMI interface | No        |

## CONFIG\_LMMIH

LMMI (Lattice Memory Mapped Interface) interface to the configuration block

Architectures supported:

- ▶ LFD2NX-35
- ▶ LFD2NX-65

**Table 93: Input Ports**

| Name        | Description              |
|-------------|--------------------------|
| LMMICLK     | Clock for LMMI interface |
| LMMIREQUEST | Start transaction        |

**Table 93: Input Ports**

| Name            | Description              |
|-----------------|--------------------------|
| LMMIWRRD_N      | 1=write, 0=read          |
| LMMIOFFSET[7:0] | Register offset          |
| LMMIWDATA[7:0]  | Write data               |
| LMMIRESETN      | Reset the LMMI interface |

**Table 94: Output Ports**

| Name           | Description                                                    |
|----------------|----------------------------------------------------------------|
| LMMIRDATA[7:0] | Read data                                                      |
| LMMIREADY      | LMMI ready signal                                              |
| LMMIRDATAVALID | Read transaction is complete and LMMIRDATA contains valid data |

**Table 95: Parameters**

| Name    | Values                  | Description               | Inferable |
|---------|-------------------------|---------------------------|-----------|
| LMMI_EN | "DIS" (default)<br>"EN" | Enable the LMMI interface | No        |

## CRE

Cryptographic Engine

### Note:

CRE is only available with the CRE Control Pack.

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5-25
- ▶ LFMXO5T
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T

- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 96: Input Ports**

| Name        | Range | Description              |
|-------------|-------|--------------------------|
| LMMICKL     | 1     | Clock for LMMI interface |
| LMMIRESET_N | 1     | LMMI Resetrn             |
| LMMIREQUEST | 1     | Start transaction        |
| LMMIWRRD_N  | 1     | Write = HIGH, Read = LOW |
| LMMIOFFSET  | 17:0  | Register offset          |
| LMMIWDATA   | 31:0  | Write data               |
| ASFCLKI     | 1     | Clock for ASF            |
| ASFRDI      | 1     | Read strobe              |
| ASFRESETI   | 1     | Resets the ASF logic     |

**Table 97: Output Ports**

| Name           | Range | Description                                                    |
|----------------|-------|----------------------------------------------------------------|
| LMMIRDATA      | 31:0  | Read data                                                      |
| LMMIRDATAVALID | 1     | Read transaction is complete and LMMIRDATA contains valid data |
| LMMIREADY      | 1     | LMMI ready signal                                              |
| ASFEMPTYO      | 1     | Indicates FIFO is empty                                        |
| ASFFULLO       | 1     | Indicates FIFO is full                                         |

**Table 98: Parameters**

| Name        | Values                                 | Description                     |
|-------------|----------------------------------------|---------------------------------|
| CRE_DISABLE | ENABLED ( <i>default</i> )<br>DISABLED | Disable CRE                     |
| GSR         | ENABLED ( <i>default</i> )<br>DISABLED | Enable Global Set/Reset Control |
| OTP_EN      | ENABLED<br>DISABLED ( <i>default</i> ) | Enable OTP                      |

## CREA

Controls security registers to provide the security capability

Architectures supported:

- ▶ LAV-AT-ES1

**Table 99: Input Ports**

| Name               | Range | Description                                                                                                  |
|--------------------|-------|--------------------------------------------------------------------------------------------------------------|
| ATM_ALARM          | 1     | ATM Alarm                                                                                                    |
| ATM_ACTION_REQUEST | 3:0   | ATM ACTION Request                                                                                           |
| AHBL_HCLK          | 1     | Bus Clock                                                                                                    |
| AHBL_HRESET_N      | 1     | Reset Active Low                                                                                             |
| AHBL_HSEL          | 1     | Slave select indicates current transfer is intended for selected slave                                       |
| AHBL_HADDR         | 31:0  | Address bus                                                                                                  |
| AHBL_HBURST        | 2:0   | Indicates single or burst transfer - 4,8,and 16                                                              |
| AHBL_HPROT         | 3:0   | Protection control signals about bus access                                                                  |
| AHBL_HSIZE         | 2:0   | Size of the transfer                                                                                         |
| AHBL_HMASTLOCK     | 1     | When HIGH, this signal indicates that the current transfer is part of a locked sequence.                     |
| AHBL_HTRANS        | 1:0   | Indicates transfer type - idle, busy, nonsequential, sequential                                              |
| AHBL_HWDATA        | 31:0  | Write data bus                                                                                               |
| AHBL_HWRITE        | 1     | Indicates transfer direction - high write / low read                                                         |
| AHBL_HREADY        | 1     | When HIGH, the HREADY signal indicates to the master and all slaves, that the previous transfer is complete. |

**Table 99: Input Ports (Continued)**

| Name              | Range | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Name         | Range | Description                                                                                                                  |
|--------------|-------|------------------------------------------------------------------------------------------------------------------------------|
| AXI4_ARREADY | 1     | This signal indicates that the slave is ready to accept an address and associated control signals.                           |
| AXI4_RID     | 3:0   | This signal is the identification tag for the read data group of signals generated by the slave.                             |
| AXI4_RDATA   | 31:0  | Read data                                                                                                                    |
| AXI4_RRESP   | 1:0   | This signal indicates the status of the read transfer.<br>2'b00 : OKAY<br>2'b01 : EXOKAY<br>2'b10 : SLVERR<br>2'b11 : DECERR |
| AXI4_RVALID  | 1     | This signal indicates that the channel is signaling the required read data.                                                  |
| AXI4_RLAST   | 1     | This signal indicates the last transfer in a read burst.                                                                     |
| AXI4_AWREADY | 1     | This signal indicates that the slave is ready to accept an address and associated control signals.                           |
| AXI4_WREADY  | 1     | This signal indicates that the slave can accept the write data.                                                              |
| AXI4_BVALID  | 1     | This signal indicates that the channel is signaling a valid write response.                                                  |
| AXI4_BID     | 3:0   | This signal is the ID tag of the write response.                                                                             |
| AXI4_BRESP   | 1:0   | This signal indicates the status of the write transaction.                                                                   |

**Table 100: Output Ports**

| Name            | Range | Description                                                                                                                                        |
|-----------------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| ATM_ACTION_DONE | 3:0   | ATM Action Done                                                                                                                                    |
| AHBL_HRDATA     | 31:0  | Read data bus                                                                                                                                      |
| AHBL_HREADYOUT  | 1     | When HIGH, the HREADYOUT signal indicates that a transfer has finished on the bus. This signal can be driven LOW to extend a transfer.             |
| AHBL_HRESP      | 1     | When low, it indicates transfer is ok when high, it indicates transfer is error                                                                    |
| INTERRUPT       | 1     | Interrupt output signal                                                                                                                            |
| AXIS_DST_TREADY | 1     | Indicates that the security engine is ready to accept the data on tdata[127:0]. Data transfer will occur when both tvalid and tready are asserted. |

**Table 100: Output Ports (Continued)**

| Name             | Range | Description                                                                                                                                                                                                                                                         |
|------------------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AXIS_SRC_TVALID  | 1     | Indicates tdata[127:0] is valid when asserted (1b). When de-asserted (0b) the data on tdata[127:0] is invalid.<br><br>Data transfer will occur when both tvalid and tready are asserted.                                                                            |
| AXIS_SRC_TDATA   | 127:0 | 128-bit stream data output from the AES High Speed, and 32-bit for DPA resistant, valid when tvalid is high (1b). Depending on the tuser[1:0] bits, this bus contains payload data, IV data or TAG data.<br><br>For all transfers, all bytes on this bus are valid. |
| AXIS_SRC_TSTRB32 | 3:0   | 32-bit word qualifier indicates data word or position word. Valid values are 0x0 or 0x1 for data from DPA resistant core, 0x0 or 0xF for data from AES High Speed core.                                                                                             |
| AXIS_SRC_TKEEP32 | 3:0   | 32-bit word qualifier indicates data word or position word. Valid values are 0x0 or 0x1 for data from DPA resistant core, 0x0 or 0xF for data from AES High Speed core.                                                                                             |
| AXIS_SRC_TID     | 1:0   | Indicates the master which initiated the transaction.<br><br>DPA resistant: 0x0 = DMA, 0x2 = CPU<br>AES High Speed - 0x3                                                                                                                                            |
| AXIS_SRC_TUSER   | 1:0   | AES High Speed:<br>0x0 - payload data<br>0x1 - IV data<br>0x2 - TAG data<br><br>DPA resistant:<br>0x0 - payload data                                                                                                                                                |
| AXIS_SRC_TDEST   | 1:0   | Determined by parameter passed to Security APIs                                                                                                                                                                                                                     |
| AXIS_SRC_TLAST   | 1     | Indicates the last data word of a transfer. This signal must be asserted high (1b) when the last packet data is provided on the tdata bus.                                                                                                                          |
| AXI4_ARADDR      | 31:0  | The read address gives the address of the first transfer in a read burst transaction.                                                                                                                                                                               |
| AXI4_ARBURST     | 1:0   | The burst type and the size information determine how the address for each transfer within the burst is calculated.<br>2'b00 : FIXED<br>2'b01 : INCR<br>2'b10 : WRAP<br>2'b11 : Reserved                                                                            |
| AXI4_ARID        | 3:0   | This signal is the identification tag for the read address group of signals.                                                                                                                                                                                        |
| AXI4_ARLEN       | 7:0   | This signal indicates the exact number of transfers in a burst. 1 to beat INCR bursts supported.<br><br>WRAP burst lengths of 2, 4, 8, and 16 are supported.                                                                                                        |

**Table 100: Output Ports (Continued)**

| Name         | Range | Description                                                                                                                                                                                                                          |
|--------------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AXI4_ARPROT  | 2:0   | This signal indicates the privilege and security level of the transaction, and whether the transaction is a data access or an instruction access.                                                                                    |
| AXI4_ARSIZE  | 2:0   | This signal indicates the size of each transfer in the burst. Byte sizes of 1 - 4 are supported.                                                                                                                                     |
| AXI4_ARVALID | 1     | This signal indicates that the channel is signaling valid read address and control information.                                                                                                                                      |
| AXI4_RREADY  | 1     | This signal indicates that the master can accept the read data and response information.                                                                                                                                             |
| AXI4_AWADDR  | 31:0  | The write address gives the address of the first transfer in a write burst transaction.                                                                                                                                              |
| AXI4_AWBURST | 1:0   | The burst type and the size information, determine how the address for each transfer within the burst is calculated. This field is encoded as follows:<br>2'b00 : FIXED<br>2'b01 : INCR<br>2'b10 : WRAP<br>2'b11 : Reserved          |
| AXI4_AWID    | 3:0   | This signal is the identification tag for the write address group of signals.                                                                                                                                                        |
| AXI4_AWLEN   | 7:0   | The burst length gives the exact number of transfers in a burst. This information determines the number of data transfers associated with the address. 1 to beat INCR bursts supported. 2, 4, 8, or 16 length WRAP bursts supported. |
| AXI4_AWPROT  | 2:0   | This signal indicates the privilege and security level of the transaction, and whether the transaction is a data access or an instruction access.                                                                                    |
| AXI4_AWSIZE  | 2:0   | This signal indicates the size of each transfer in the burst. 1 - 4-byte sizes are supported.                                                                                                                                        |
| AXI4_AWVALID | 1     | This signal indicates that the channel is signaling valid write address and control information.                                                                                                                                     |

**Table 100: Output Ports (Continued)**

| Name        | Range | Description                                                                                                                      |
|-------------|-------|----------------------------------------------------------------------------------------------------------------------------------|
| AXI4_WVALID | 1     | This signal indicates that valid write data and strobes are available.                                                           |
| AXI4_WDATA  | 31:0  | Write data.                                                                                                                      |
| AXI4_WLAST  | 1     | This signal indicates the last transfer in a write burst.                                                                        |
| AXI4_WSTRB  | 3:0   | This signal indicates which byte lanes hold valid data. There is one write strobe bit for each eight bits of the write data bus. |
| AXI4_BREADY | 1     | This signal indicates that the master can accept a write response.                                                               |

| Name                    | Values                            | Description                     |
|-------------------------|-----------------------------------|---------------------------------|
| BITSTREAM_AUTH          | "DISABLED" (default)<br>"ENABLED" | Enable JTAG 1                   |
| BBRAM_PUBKEY_REVO<br>KE | "DISABLED" (default)<br>"ENABLED" | Enable BBRRAM Public Key Revoke |
| BBRAM                   | "DISABLED"<br>"ENABLED" (default) | Enable BBRRAM                   |
| ERASE_KEY_PIN           | "DISABLED" (default)<br>"ENABLED" | Enable Key Pin Erase            |

## DCC

Dynamic Clock Control with Positive Enable

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T

- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 102: Input Ports**

| Name | Description  |
|------|--------------|
| CLKI | Clock in     |
| CE   | Clock enable |

**Table 103: Output Ports**

| Name | Description                                      |
|------|--------------------------------------------------|
| CLKO | Clock out. Zero when CE is 0. CLKI when CE is 1. |

**Table 104: Parameters**

| Name  | Values                 | Description                                                                        |
|-------|------------------------|------------------------------------------------------------------------------------|
| DCCEN | "0" ( <i>default</i> ) | Enables dynamic control.                                                           |
|       | "1"                    | "0": CLKO = CLKI regardless of the CE input.<br>"1": CLKO depends on the CE input. |

## DCCA

Dynamic clock control

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 105: Input Ports**

| Name | Description  |
|------|--------------|
| CLKI | Input clock  |
| CE   | Clock enable |

**Table 106: Output Ports**

| Name | Description  |
|------|--------------|
| CLKO | Output clock |

## DCCB

Dynamic Quadrant Clock Enable/Disable

Architectures Supported:

▶ LFMXO4

**Table 107: Input Ports**

| Name | Range | Description  |
|------|-------|--------------|
| CLKI | 1     | Input clock  |
| CE   | 1     | Clock enable |

**Table 108: Output Ports**

| Name | Range | Description  |
|------|-------|--------------|
| CLKO | 1     | Output clock |

DCCB is the dynamic quadrant clock enable/disable primitive. In each quadrant, the dynamic quadrant clock enable/disable is available on the output of the center mux for the primary clocks CLK[5:0]. The dynamic quadrant clock enable/disable feature lets the internal logic control the quadrant primary clock network. When a clock network is disabled, all the logic fed by the clock network does not toggle, reducing the overall power consumption of the device. You need to instantiate a primitive (DCCB) in order to control the enable/disable function.

### DCCB Usage with VHDL

#### Library Instantiation

```
library lattice;
use lattice.components.all;
```

#### Component Declaration

```
component DCCA
  port (CLKI : in std_logic;
        CE   : in std_logic;
        CLKO : out std_logic);
end component;
```

#### DCCB Instantiation

```
I1: DCCA
  port map (CLKI => CLKI;
            CE   => CE;
            CLKO => CLKO);
end component;
```

### DCCB Usage with Verilog HDL

#### Component Declaration

```
module DCCA (CLKI,
             CE,
             CLKO);

  input CLKI;
  input CE;
  output CLKO;
endmodule
```

#### DCCB Instantiation

```
DCCA I1 (.CLKI (CLKI),
         .CE   (CE),
         .CLKO (CLKO));
```

## DCMA

Dynamic Clock Mux

Architectures Supported:

▶ LFMXO4

**Table 109: Input Ports**

| Name | Range | Description           |
|------|-------|-----------------------|
| CLK  | 1:0   | Input clock           |
| SEL  | 1     | Clock select from CIB |

**Table 110: Output Ports**

| Name   | Range | Description                       |
|--------|-------|-----------------------------------|
| DCMOUT | 1     | Output from the primary clock mux |

### Description

DCMA is a clock buffer incorporating a multiplexer function, whose output switches between the two clock inputs. It is not recommended that you route the PLL feedback signals through the multiplexer, because the PLL will lose lock.

### DCMA Usage with VHDL

#### Library Instantiation

```
library lattice;
use lattice.components.all;
```

#### Component Declaration

```
component DCMA
  port (CLK0    : in std_logic;
        CLK1    : in std_logic;
        SEL     : in std_logic;
```

```
        DCMOUT :out std_logic);  
end component;
```

### DCMA Instantiation

```
I1: DCMA  
    port map (CLK0 => CLK0,  
              CLK1 => CLK1,  
              SEL  => SEL,  
              DCMOUT => DCMOUT);  
end component;
```

## DCMA Usage with Verilog HDL

### Component Declaration

```
module DCMA (CLK0, CLK1, SEL, DCMOUT);  
input CLK0;  
input CLK1;  
input SEL;  
output DCMOUT;  
endmodule
```

### DCMA Instantiation

```
DCMA I1 (.CLK0 (CLK0);  
        .CLK1 (CLK1);  
        .SEL  (SEL);  
        .DCMOUT (DCMOUT));
```

## DCS

### Dynamic Clock Selection

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 111: Input Ports**

| Name     | Description                                  |
|----------|----------------------------------------------|
| CLK0     | Input clock to the edge bridge clock select. |
| CLK1     | Input clock to the edge bridge clock select. |
| SEL      | From CIB, edge bridge clock select.          |
| SELFORCE | Force enable                                 |

**Table 112: Output Ports**

| Name   | Description  |
|--------|--------------|
| DCSOUT | Output clock |

**Table 113: Parameters**

| Name    | Values         | Description                                     | Output<br>(SEL = 0) | Output<br>(SEL = 1) |
|---------|----------------|-------------------------------------------------|---------------------|---------------------|
| DCSMODE | "VCC"          | VCC                                             | 1                   | 1                   |

## DDRDLL

Delay-Locked Loop Master Block for DDR Functionality

Architectures supported:

- ▶ LFCPNX

- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 117: Input Ports**

| Name      | Description                             |
|-----------|-----------------------------------------|
| FREEZE    | Signal used to freeze or release        |
| CLKIN     | Input clock                             |
| RST       | Reset                                   |
| UDDCNTL_N | Update control to update the delay code |

**Table 118: Output Ports**

| Name       | Description                                                                                    |
|------------|------------------------------------------------------------------------------------------------|
| CODE[8:0]  | The delay codes from the DDRDLL to be used to delay input of DQS, DLLDEL and output of LPDDR4. |
| LOCK       | Lock output                                                                                    |
| DCNTL[8:0] | The delay codes from the DDRDLL available for the user IP.                                     |

**Table 119: Parameters**

| Name | Values                            | Description                       |
|------|-----------------------------------|-----------------------------------|
| GSR  | "ENABLED" (default)<br>"DISABLED" | GSRN signal enable/disable select |

**Table 119: Parameters (Continued)**

| Name            | Values                                                          | Description                                                                                                                                          |
|-----------------|-----------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| ENA_ROUNDOFF    | "ENABLED" (default)<br>"DISABLED"                               | DLL counter round-off select.<br>0: Disable round-off<br>1: Enable round-off, more stable code                                                       |
| FORCE_MAX_DELAY | "CODE_OR_LOCK_FROM_DLL_LOOP" (default)<br>"FORCE_LOCK_AND_CODE" | DLL control code forcing.<br>0: Code/lock generated from DLL loop<br>1: Force lock and code is set to maximum of 255 for lower input frequency mode. |

DDRDLL can generate a phase shift code (90 degree) according to its running frequency and provide this code to every individual DQS block and DLLDEL slave delay element located in two adjacent sides if available.

## DDRDLLA

DLL for creating the 90° clock delay

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 120: Input Ports**

| Name      | Range | Type    | Active State | Description                                                                                                                                     |
|-----------|-------|---------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| SCLK      | 1     | Data    | High         | Clock input                                                                                                                                     |
| RST       | 1     | Control | High         | Reset input                                                                                                                                     |
| UDDCNTL_N | 1     | Control | Low          | Update control to update the delay code.<br>0: the delay code out of the DDRDLL is updated. Should not be active during a read or a write cycle |
| FREEZE    | 1     | Control | High         | Releases the DDRDLL input clock                                                                                                                 |

**Table 121: Output Ports**

| Name  | Range | Type | Active State | Description                                                                                   |
|-------|-------|------|--------------|-----------------------------------------------------------------------------------------------|
| CODE  | 8:0   | Data | High         | The delay codes from the DDRDLL to be used to delay input of DQS, DLLDEL and output of LPDDR4 |
| LOCK  | 1     | Data | High         | Lock output to indicate the DDRDLL has valid delay output                                     |
| DCNTL | 8:0   | Data | High         | The delay codes from the DDRDLL available for the user IP                                     |

**Table 122: Parameters**

| PHY_OUT_DQS_OEN1    | 1            | Enable for DQS output from PHY                                                                        |
| DQ_READ0            | 7:0          | FPGA IO ODT Enable For Data                                                                           |
| DQ_READ1            | 7:0          | FPGA IO ODT Enable For Data                                                                           |
| DM_READ0            | 1            | FPGA IO ODT enable for data mask                                                                      |
| DM_READ1            | 1            | FPGA IO ODT enable for data mask                                                                      |
| DQS_READ0           | 1            | FPGA IO ODT enable for data strobe                                                                    |
| DQS_READ1           | 1            | FPGA IO ODT enable for data strobe                                                                    |
| DQ_IE0              | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DQ_IE1              | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DM_IE0              | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE1              | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DQS_IE0             | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE1             | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| VREF_OUTPUT_ENABLE0 | 1            | Global control input to enable/disable VREF generation if required                                    |
| VREF_OUTPUT_ENABLE1 | 1            | Global control input to enable/disable VREF generation if required                                    |
| VREF_VALUE0         | 6:0          | Vref value set for each byte lane - width can be customized                                           |

**Table 124: Output Ports (Continued)**

| Name          | Range | Description                                                 |
|---------------|-------|-------------------------------------------------------------|
| VREF_VALUE1   | 6:0   | Vref value set for each byte lane - width can be customized |
| CA_OUT_CLK0   | 1     | DRAM clock output from PHY                                  |
| CA_OUT_CLK1   | 1     | DRAM clock output from PHY                                  |
| CA_OUT_RST_N  | 1     | DRAM reset output from PHY                                  |
| CA_OUT_A0     | 1     | DRAM MA output from PHY                                     |
| CA_OUT_A1     | 1     | DRAM MA output from PHY                                     |
| CA_OUT_A2     | 1     | DRAM MA output from PHY                                     |
| CA_OUT_A3     | 1     | DRAM MA output from PHY                                     |
| CA_OUT_A4     | 1     | DRAM MA output from PHY                                     |
| CA_OUT_A5     | 1     | DRAM MA output from PHY                                     |
| CA_OUT_A6     | 1     | DRAM MA output from PHY                                     |
| CA_OUT_A7     | 1     | DRAM MA output from PHY                                     |
| CA_OUT_A8     | 1     | DRAM MA output from PHY                                     |
| CA_OUT_A9     | 1     | DRAM MA output from PHY                                     |
| CA_OUT_A10    | 1     | DRAM MA output from PHY                                     |
| CA_OUT_A11    | 1     | DRAM MA output from PHY                                     |
| CA_OUT_A12    | 1     | DRAM MA output from PHY                                     |
| CA_OUT_A13    | 1     | DRAM MA output from PHY                                     |
| CA_OUT_A14    | 1     | DRAM MA output from PHY                                     |
| CA_OUT_A15    | 1     | DRAM MA output from PHY                                     |
| CA_OUT_A16    | 1     | DRAM MA output from PHY                                     |
| CA_OUT_CS_N   | 1:0   | DRAM CS_N output from PHY                                   |
| CA_OUT_CKE    | 1:0   | DRAM CKE output from PHY                                    |
| CA_OUT_BA2    | 1     | DRAM BA output from PHY                                     |
| CA_OUT_BA1    | 1     | DRAM BA output from PHY                                     |
| CA_OUT_BA0    | 1     | DRAM BA output from PHY                                     |
| CA_OUT_RAS_N  | 1     | DRAM RAS_N output from PHY                                  |
| CA_OUT_CAS_N  | 1     | DRAM CAS_N output from PHY                                  |
| CA_OUT_WE_N   | 1     | DRAM WE_N output from PHY                                   |
| CA_OUT_ODT    | 1:0   | DRAM ODT output from PHY                                    |
| CA_OUT_CS_OEN | 1     | DDR5 mode register bit                                      |

**Table 124: Output Ports (Continued)**

| Name                                | Range | Description                                                                                   |
|-------------------------------------|-------|-----------------------------------------------------------------------------------------------|
| CA_OUT_CLK_OEN0                     | 1     | Disable MCLK output                                                                           |
| CA_OUT_CLK_OEN1                     | 1     | Disable MCLK output                                                                           |
| VREF_CA_VALUE                       | 6:0   | VREF value driven for CA IOs                                                                  |
| UPDATE                              | 1     | Pulsed to indicate that the last TX & RX calibrated trim value may be driven on the pad-ring  |
| ADDR_CTRL_LOPHY_OUTBACK_RCV<br>R_EN | 1     | Used to enable loopback test on Address/Control/Clock (CA) IOs                                |
| ADDR_CTRL_VREF_OUTPUT_ENABLE        | 1     | VREF output enable                                                                            |
| ADRCtrl_DRIVERS_OEN                 | 1     | DDRPHY IP tristate output to PIC DDRPHY command address tristate control DDRPHY_TO            |
| RECEIVER_EN0                        | 1     | IO will connect to stdby_inr_cib to support memory & non-memory; Bank based & User Controlled |
| RECEIVER_EN1                        | 1     | IO will connect to stdby_inr_cib to support memory & non-memory; Bank based & User Controlled |

**Table 125: Parameters**

| Name          | Values                                                   | Type                                                                                                        |
|---------------|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| RATE          | "HALF" (default)<br>"FULL"                               | DDR rate                                                                                                    |
| PROTOCOL      | "DDR3L" (default)<br>"DDR4"                              | DDR protocol                                                                                                |

## DDRPHY16E

Supports LPDDR4 protocol with X16 data width

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

Table 126: Input Ports

| Name             | Range | Description                   |
|------------------|-------|-------------------------------|
| PHYCLK           | 1     | DDR Clock                     |
| SCLK             | 1     | Primary Clock                 |
| PCLK             | 1     | AXB Bus Interface Clock       |
| RESET            | 1     | Reset                         |
| DFI_RDDATA_EN    | 1     | DDRPHY Read Data Enable       |
| DFI_RDDATA_EN_P2 | 1     | DDRPHY Read Data Enable P2P3  |
| DFI_WRDATA_EN    | 1     | DDRPHY Write Data Enable      |
| DFI_WRDATA_EN_P2 | 1     | DDRPHY Write Data Enable P2P3 |
| DFI_WRDATA0      | 63:0  | DDRPHY Write Data             |
| DFI_WRDATA1      | 63:0  | DDRPHY Write Data             |
| DFI_WRDATA_MASK0 | 7:0   | DDRPHY Write Data Mask        |
| DFI_WRDATA_MASK1 | 7:0   | DDRPHY Write Data Mask        |

**Table 126: Input Ports (Continued)**

| <b>Name</b>              | <b>Range</b> | <b>Description</b>                                       |
|--------------------------|--------------|----------------------------------------------------------|
| DFI_PHYUPD_ACK           | 1            | DDRPHY PHY update acknowledge                            |
| DFI_CTRLUPD_REQ          | 1            | DDRPHY PHY update request                                |
| DFI_DRAM_CLK_DISABLE     | 1            | DRAM clock disable                                       |
| DFI_ADDRESS              | 5:0          | DDRPHY address                                           |
| DFI_WRDATA_CS            | 1:0          | DDRPHY Write Data Chip Select                            |
| DFI_RDDATA_CS            | 1:0          | DDRPHY Read Data Chip Select                             |
| DFI_CS_N                 | 1:0          | DDRPHY Chip Select                                       |
| DFI_CKE                  | 1:0          | DDRPHY Clock Enable                                      |
| DFI_ODT                  | 1:0          | DDRPHY ODT                                               |
| DFI_ADDRESS_P1           | 5:0          | DDRPHY Phase1 Address                                    |
| DFI_WRDATA_CS_P1         | 1:0          | DDRPHY Write Data Chip Select Phase1                     |
| DFI_RDDATA_CS_P1         | 1:0          | DDRPHY Read Data Chip Select Phase1                      |
| DFI_CS_N_P1              | 1:0          | DDRPHY Chip Select Phase1                                |
| DFI_CKE_P1               | 1:0          | DDRPHY Clock Enable Phase1                               |
| DFI_ODT_P1               | 1:0          | DDRPHY ODT Phase1                                        |
| DFI_RESET_N              | 1            | DDRPHY DFI Reset                                         |
| TURN_ON_IE               | 1            | DDRPHY Enable                                            |
| TURN_OFF_ADRCTRL_DRIVERS | 1            | CIB Input control to tristate DDRPHY command address pad |
| AXB_SEL                  | 1            | AXB Bus Interface: Select                                |
| AXB_RESET_N              | 1            | AXB Bus Interface: Reset                                 |
| AXB_ADDR                 | 8:0          | AXB Bus Interface: Address                               |
| AXB_WRITE                | 1            | AXB Bus Interface: Write Enable                          |
| AXB_WDATA                | 31:0         | AXB Bus Interface: Write Data                            |
| PHY_IN_DQ0               | 7:0          | DQ Data Bus to PHY                                       |
| PHY_IN_DQ1               | 7:0          | DQ Data Bus to PHY                                       |
| PHY_IN_DM0               | 1            | DBI (Data Bus Inversion enable) to PHY                   |
| PHY_IN_DM1               | 1            | DBI (Data Bus Inversion enable) to PHY                   |
| PHY_IN_DQS0              | 1            | DQS data strobe to PHY                                   |
| PHY_IN_DQS1              | 1            | DQS data strobe to PHY                                   |
| DFI_ADDRESS_P2           | 5:0          | DDRPHY Phase2 Address                                    |
| DFI_WRDATA_CS_P2         | 1:0          | DDRPHY Write Data Chip Select Phase2                     |

**Table 126: Input Ports (Continued)**

| Name             | Range | Description                          |
|------------------|-------|--------------------------------------|
| DFI_RDDATA_CS_P2 | 1:0   | DDRPHY Read Data Chip Select Phase2  |
| DFI_CS_N_P2      | 1:0   | DDRPHY Chip Select Phase2            |
| DFI_CKE_P2       | 1:0   | DDRPHY Clock Enable Phase2           |
| DFI_ODT_P2       | 1:0   | DDRPHY ODT Phase2                    |
| DFI_ADDRESS_P3   | 19:0  | DDRPHY Phase3 Address                |
| DFI_WRDATA_CS_P3 | 1:0   | DDRPHY Write Data Chip Select Phase3 |
| DFI_RDDATA_CS_P3 | 1:0   | DDRPHY Read Data Chip Select Phase3  |
| DFI_CS_N_P3      | 1:0   | DDRPHY Chip Select Phase3            |
| DFI_CKE_P3       | 1:0   | DDRPHY Clock Enable Phase3           |
| DFI_ODT_P3       | 1:0   | DDRPHY ODT Phase3                    |

**Table 127: Output Ports**

| Name                 | Range | Description                       |
|----------------------|-------|-----------------------------------|
| DFI_RDDATA0          | 63:0  | DDRPHY Read Data                  |
| DFI_RDDATA1          | 63:0  | DDRPHY Read Data                  |
| DFI_RDDATA_DBI0      | 7:0   | DDRPHY Read Data DBI              |
| DFI_RDDATA_DBI1      | 7:0   | DDRPHY Read Data DBI              |
| DFI_RDDATA_VALID0    | 1     | DDRPHY Read Data Valid            |
| DFI_RDDATA_VALID1    | 1     | DDRPHY Read Data Valid            |
| DFI_RDDATA_VALID0_P2 | 1     | DDRPHY Read Data Valid P2P3       |
| DFI_RDDATA_VALID1_P2 | 1     | DDRPHY Read Data Valid P2P3       |
| DFI_PHYUPD_REQ       | 1     | DDRPHY PHY Update Request         |
| DFI_PHYUPD_TYPE      | 1:0   | DDRPHY PHY Update Type            |
| DFI_CTRLUPD_ACK      | 1     | DDRPHY Control Update Acknowledge |
| DFIIT_COMPLETE       | 1     | DDRPHY Initialization Complete    |
| AXB_READY            | 1     | AXB bus interface: Read Enable    |
| AXB_RDATA            | 31:0  | AXB bus interface: Read Data      |
| PHY_OUT_DQ0          | 7:0   | DQ data bus from PHY              |
| PHY_OUT_DQ1          | 7:0   | DQ data bus from PHY              |
| PHY_OUT_DQ_OEN0      | 7:0   | Enable for DQ output from PHY     |
| PHY_OUT_DQ_OEN1      | 7:0   | Enable for DQ output from PHY     |

**Table 127: Output Ports (Continued)**

| <b>Name</b>         | <b>Range</b> | <b>Description</b>                                                                                    |
|---------------------|--------------|-------------------------------------------------------------------------------------------------------|
| PHY_OUT_DM0         | 1            | DM (Data Mask) from PHY                                                                               |
| PHY_OUT_DM1         | 1            | DM (Data Mask) from PHY                                                                               |
| PHY_OUT_DM_OEN0     | 1            | Enable for DM output from PHY                                                                         |
| PHY_OUT_DM_OEN1     | 1            | Enable for DM output from PHY                                                                         |
| PHY_OUT_DQS0        | 1            | DQS data strobe from PHY                                                                              |
| PHY_OUT_DQS1        | 1            | DQS data strobe from PHY                                                                              |
| PHY_OUT_DQS_OEN0    | 1            | Enable for DQS output from PHY                                                                        |
| PHY_OUT_DQS_OEN1    | 1            | Enable for DQS output from PHY                                                                        |
| DQ_READ0            | 7:0          | FPGA IO ODT Enable For Data                                                                           |
| DQ_READ1            | 7:0          | FPGA IO ODT Enable For Data                                                                           |
| DM_READ0            | 1            | FPGA IO ODT enable for data mask                                                                      |
| DM_READ1            | 1            | FPGA IO ODT enable for data mask                                                                      |
| DQS_READ0           | 1            | FPGA IO ODT enable for data strobe                                                                    |
| DQS_READ1           | 1            | FPGA IO ODT enable for data strobe                                                                    |
| DQ_IE0              | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DQ_IE1              | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DM_IE0              | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE1              | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DQS_IE0             | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE1             | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| VREF_OUTPUT_ENABLE0 | 1            | Global control input to enable/disable VREF generation if required                                    |
| VREF_OUTPUT_ENABLE1 | 1            | Global control input to enable/disable VREF generation if required                                    |
| VREF_VALUE0         | 6:0          | Vref value set for each byte lane - width can be customized                                           |
| VREF_VALUE1         | 6:0          | Vref value set for each byte lane - width can be customized                                           |
| CA_OUT_CLK0         | 1            | DRAM clock output from PHY                                                                            |
| CA_OUT_CLK1         | 1            | DRAM clock output from PHY                                                                            |

**Table 127: Output Ports (Continued)**

| Name                             | Range | Description                                                                                   |
|----------------------------------|-------|-----------------------------------------------------------------------------------------------|
| CA_OUT_RST_N                     | 1     | DRAM reset output from PHY                                                                    |
| CA_OUT_A0                        | 1     | DRAM MA output from PHY                                                                       |
| CA_OUT_A1                        | 1     | DRAM MA output from PHY                                                                       |
| CA_OUT_A2                        | 1     | DRAM MA output from PHY                                                                       |
| CA_OUT_A3                        | 1     | DRAM MA output from PHY                                                                       |
| CA_OUT_A4                        | 1     | DRAM MA output from PHY                                                                       |
| CA_OUT_A5                        | 1     | DRAM MA output from PHY                                                                       |
| CA_OUT_CS_N                      | 1:0   | DRAM CS_N output from PHY                                                                     |
| CA_OUT_CKE                       | 1:0   | DRAM CKE output from PHY                                                                      |
| CA_OUT_CS_OEN                    | 1     | DDR5 mode register bit                                                                        |
| CA_OUT_CLK_OEN0                  | 1     | Disable MCLK output                                                                           |
| CA_OUT_CLK_OEN1                  | 1     | Disable MCLK output                                                                           |
| VREF_CA_VALUE                    | 6:0   | VREF value driven for CA IOs                                                                  |
| UPDATE                           | 1     | Pulsed to indicate that the last TX & RX calibrated trim value may be driven on the pad-ring  |
| ADDR_CTRL_LOPHY_OUTBACK_RCV_R_EN | 1     | Used to enable loopback test on Address/Control/Clock (CA) IOs                                |
| ADDR_CTRL_VREF_OUTPUT_ENABLE     | 1     | VREF output enable                                                                            |
| ADRCtrl_DRIVERS_OEN              | 1     | DDRPHY IP tristate output to PIC DDRPHY command address tristate control DDRPHY_TO            |
| RECEIVER_EN0                     | 1     | IO will connect to stdby_inr_cib to support memory & non-memory; Bank based & User Controlled |
| RECEIVER_EN1                     | 1     | IO will connect to stdby_inr_cib to support memory & non-memory; Bank based & User Controlled |

**Table 128: Parameters**

| Name     | Values                     | Description  |
|----------|----------------------------|--------------|
| RATE     | "HALF" (default)<br>"FULL" | DDR rate     |
| PROTOCOL | "LPDDR4" (default)         | DDR protocol |

| Name          | Values                                                   | Description                                                                                                 |
|---------------|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| EXT_RES       | "PER_BANK" (default)<br>"PER_DDRPHY"                     | External Resistor for PVT Cal                                                                               |
| IO_CAL_UPDATE | "CONTINUOUS" (default)<br>"ONE TIME"<br>"CONTROL_UPDATE" | Continuous IO calibration update<br>One-time IO calibration update<br>User-controlled IO calibration update |

## DDRPHY32D

Supports DDR4 and DDR3L protocols with X32 data width

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

|                             |                                 |
|-----------------------------|---------------------------------|
| PHYCLK                      | DFI_RDDATA [0-3] [63:0]         |
| SCLK                        | DFI_RDDATA_DBI [0-3] [7:0]      |
| PCLK                        | DFI_RDDATA_VALID [0-3]          |
| RESET                       | DFI_RDDATA_VALID_P2 [0-3]       |

| DFI_WE_N_P3      | 1     | DDRPHY Write Enable Phase3           |
| DFI_BANK_P3      | 2:0   | DDRPHY Bank Address Phase3           |
| DFI_BG_P3        | 2:0   | DDRPHY Bank Group Phase3             |
| DFI_CID_P3       | 1     | DDRPHY Chip ID Phase3                |
| DFI_CS_N_P3      | 1:0   | DDRPHY Chip Select Phase3            |
| DFI_CKE_P3       | 1:0   | DDRPHY Clock Enable Phase3           |
| DFI_ODT_P3       | 1:0   | DDRPHY ODT Phase3                    |

**Table 130: Output Ports**

| Name              | Range | Description            |
|-------------------|-------|------------------------|
| DFI_RDDATA0       | 63:0  | DDRPHY Read Data       |
| DFI_RDDATA1       | 63:0  | DDRPHY Read Data       |
| DFI_RDDATA2       | 63:0  | DDRPHY Read Data       |
| DFI_RDDATA3       | 63:0  | DDRPHY Read Data       |
| DFI_RDDATA_DBI0   | 7:0   | DDRPHY Read Data DBI   |
| DFI_RDDATA_DBI1   | 7:0   | DDRPHY Read Data DBI   |
| DFI_RDDATA_DBI2   | 7:0   | DDRPHY Read Data DBI   |
| DFI_RDDATA_DBI3   | 7:0   | DDRPHY Read Data DBI   |
| DFI_RDDATA_VALID0 | 1     | DDRPHY Read Data Valid |
| DFI_RDDATA_VALID1 | 1     | DDRPHY Read Data Valid |
| DFI_RDDATA_VALID2 | 1     | DDRPHY Read Data Valid |

**Table 130: Output Ports (Continued)**

| <b>Name</b>          | <b>Range</b> | <b>Description</b>                |
|----------------------|--------------|-----------------------------------|
| DFI_RDDATA_VALID3    | 1            | DDRPHY Read Data Valid            |
| DFI_RDDATA_VALID0_P2 | 1            | DDRPHY Read Data Valid P2P3       |
| DFI_RDDATA_VALID1_P2 | 1            | DDRPHY Read Data Valid P2P3       |
| DFI_RDDATA_VALID2_P2 | 1            | DDRPHY Read Data Valid P2P3       |
| DFI_RDDATA_VALID3_P2 | 1            | DDRPHY Read Data Valid P2P3       |
| DFI_PHYUPD_REQ       | 1            | DDRPHY PHY Update Request         |
| DFI_PHYUPD_TYPE      | 1:0          | DDRPHY PHY Update Type            |
| DFI_CTRLUPD_ACK      | 1            | DDRPHY Control Update Acknowledge |
| DFIIT_COMPLETE       | 1            | DDRPHY Initialization Complete    |
| AXB_READY            | 1            | AXB bus interface: Read Enable    |
| AXB_RDATA            | 31:0         | AXB bus interface: Read Data      |
| PHY_OUT_DQ0          | 7:0          | DQ data bus from PHY              |
| PHY_OUT_DQ1          | 7:0          | DQ data bus from PHY              |
| PHY_OUT_DQ2          | 7:0          | DQ data bus from PHY              |
| PHY_OUT_DQ3          | 7:0          | DQ data bus from PHY              |
| PHY_OUT_DQ_OEN0      | 7:0          | Enable for DQ output from PHY     |
| PHY_OUT_DQ_OEN1      | 7:0          | Enable for DQ output from PHY     |
| PHY_OUT_DQ_OEN2      | 7:0          | Enable for DQ output from PHY     |
| PHY_OUT_DQ_OEN3      | 7:0          | Enable for DQ output from PHY     |
| PHY_OUT_DM0          | 1            | DM (Data Mask) from PHY           |
| PHY_OUT_DM1          | 1            | DM (Data Mask) from PHY           |
| PHY_OUT_DM2          | 1            | DM (Data Mask) from PHY           |
| PHY_OUT_DM3          | 1            | DM (Data Mask) from PHY           |
| PHY_OUT_DM_OEN0      | 1            | Enable for DM output from PHY     |
| PHY_OUT_DM_OEN1      | 1            | Enable for DM output from PHY     |
| PHY_OUT_DM_OEN2      | 1            | Enable for DM output from PHY     |
| PHY_OUT_DM_OEN3      | 1            | Enable for DM output from PHY     |
| PHY_OUT_DQS0         | 1            | DQS data strobe from PHY          |
| PHY_OUT_DQS1         | 1            | DQS data strobe from PHY          |
| PHY_OUT_DQS2         | 1            | DQS data strobe from PHY          |
| PHY_OUT_DQS3         | 1            | DQS data strobe from PHY          |
| PHY_OUT_DQS_OEN0     | 1            | Enable for DQS output from PHY    |

**Table 130: Output Ports (Continued)**

| <b>Name</b>      | <b>Range</b> | <b>Description</b>                                                                                    |
|------------------|--------------|-------------------------------------------------------------------------------------------------------|
| PHY_OUT_DQS_OEN1 | 1            | Enable for DQS output from PHY                                                                        |
| PHY_OUT_DQS_OEN2 | 1            | Enable for DQS output from PHY                                                                        |
| PHY_OUT_DQS_OEN3 | 1            | Enable for DQS output from PHY                                                                        |
| DQ_READ0         | 7:0          | FPGA IO ODT Enable For Data                                                                           |
| DQ_READ1         | 7:0          | FPGA IO ODT Enable For Data                                                                           |
| DQ_READ2         | 7:0          | FPGA IO ODT Enable For Data                                                                           |

| DM_READ0         | 1            | FPGA IO ODT enable for data mask                                                                      |
| DM_READ1         | 1            | FPGA IO ODT enable for data mask                                                                      |
| DM_READ2         | 1            | FPGA IO ODT enable for data mask                                                                      |
| DM_READ3         | 1            | FPGA IO ODT enable for data mask                                                                      |
| DQS_READ0        | 1            | FPGA IO ODT enable for data strobe                                                                    |
| DQS_READ1        | 1            | FPGA IO ODT enable for data strobe                                                                    |
| DQS_READ2        | 1            | FPGA IO ODT enable for data strobe                                                                    |
| DQS_READ3        | 1            | FPGA IO ODT enable for data strobe                                                                    |
| DQ_IE0           | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DQ_IE1           | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DQ_IE2           | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DQ_IE3           | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DM_IE0           | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE1           | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE2           | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE3           | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DQS_IE0          | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE1          | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE2          | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |

**Table 130: Output Ports (Continued)**

| <b>Name</b>         | <b>Range</b> | <b>Description</b>                                                 |
|---------------------|--------------|--------------------------------------------------------------------|
| DQS_IE3             | 1            | Optional dynamic input enable for DQS IO receivers during reads    |
| VREF_OUTPUT_ENABLE0 | 1            | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE1 | 1            | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE2 | 1            | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE3 | 1            | Global control input to enable/disable VREF generation if required |
| VREF_VALUE0         | 6:0          | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE1         | 6:0          | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE2         | 6:0          | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE3         | 6:0          | Vref value set for each byte lane - width can be customized        |
| CA_OUT_CLK0         | 1            | DRAM clock output from PHY                                         |
| CA_OUT_CLK1         | 1            | DRAM clock output from PHY                                         |
| CA_OUT_RST_N        | 1            | DRAM reset output from PHY                                         |
| CA_OUT_A0           | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A1           | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A2           | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A3           | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A4           | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A5           | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A6           | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A7           | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A8           | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A9           | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A10          | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A11          | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A12          | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A13          | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A14          | 1            | DRAM MA output from PHY                                            |

**Table 130: Output Ports (Continued)**

| Name                                | Range | Description                                                                                   |
|-------------------------------------|-------|-----------------------------------------------------------------------------------------------|
| CA_OUT_A15                          | 1     | DRAM MA output from PHY                                                                       |
| CA_OUT_A16                          | 1     | DRAM MA output from PHY                                                                       |
| CA_OUT_CS_N                         | 1:0   | DRAM CS_N output from PHY                                                                     |

## DDRPHY32E

Supports LPDDR4 protocol with X32 data width

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

|                             |                                 |

| DFI_RDDATA_CS_P2 | 1:0   | DDRPHY Read Data Chip Select Phase2    |
| DFI_CS_N_P2      | 1:0   | DDRPHY Chip Select Phase2              |
| DFI_CKE_P2       | 1:0   | DDRPHY Clock Enable Phase2             |
| DFI_ODT_P2       | 1:0   | DDRPHY ODT Phase2                      |
| DFI_ADDRESS_P3   | 5:0   | DDRPHY Phase3 Address                  |
| DFI_WRDATA_CS_P3 | 1:0   | DDRPHY Write Data Chip Select Phase3   |
| DFI_CS_N_P3      | 1:0   | DDRPHY Chip Select Phase3              |
| DFI_CKE_P3       | 1:0   | DDRPHY Clock Enable Phase3             |
| DFI_ODT_P3       | 1:0   | DDRPHY ODT Phase3                      |
| DFI_RDDATA_CS_P3 | 1:0   | DDRPHY Read Data Chip Select Phase3    |

**Table 133: Output Ports**

| Name              | Range | Description            |
|-------------------|-------|------------------------|
| DFI_RDDATA0       | 63:0  | DDRPHY Read Data       |
| DFI_RDDATA1       | 63:0  | DDRPHY Read Data       |
| DFI_RDDATA2       | 63:0  | DDRPHY Read Data       |
| DFI_RDDATA3       | 63:0  | DDRPHY Read Data       |
| DFI_RDDATA_DBI0   | 7:0   | DDRPHY Read Data DBI   |
| DFI_RDDATA_DBI1   | 7:0   | DDRPHY Read Data DBI   |
| DFI_RDDATA_DBI2   | 7:0   | DDRPHY Read Data DBI   |
| DFI_RDDATA_DBI3   | 7:0   | DDRPHY Read Data DBI   |
| DFI_RDDATA_VALID0 | 1     | DDRPHY Read Data Valid |

**Table 133: Output Ports (Continued)**

| <b>Name</b>          | <b>Range</b> | <b>Description</b>                |
|----------------------|--------------|-----------------------------------|
| DFI_RDDATA_VALID1    | 1            | DDRPHY Read Data Valid            |
| DFI_RDDATA_VALID2    | 1            | DDRPHY Read Data Valid            |
| DFI_RDDATA_VALID3    | 1            | DDRPHY Read Data Valid            |
| DFI_RDDATA_VALID0_P2 | 1            | DDRPHY Read Data Valid P2P3       |
| DFI_RDDATA_VALID1_P2 | 1            | DDRPHY Read Data Valid P2P3       |
| DFI_RDDATA_VALID2_P2 | 1            | DDRPHY Read Data Valid P2P3       |
| DFI_RDDATA_VALID3_P2 | 1            | DDRPHY Read Data Valid P2P3       |
| DFI_PHYUPD_REQ       | 1            | DDRPHY PHY Update Request         |
| DFI_PHYUPD_TYPE      | 1:0          | DDRPHY PHY Update Type            |
| DFI_CTRLUPD_ACK      | 1            | DDRPHY Control Update Acknowledge |
| DFIIT_COMPLETE       | 1            | DDRPHY Initialization Complete    |
| AXB_READY            | 1            | AXB bus interface: Read Enable    |
| AXB_RDATA            | 31:0         | AXB bus interface: Read Data      |
| PHY_OUT_DQ0          | 7:0          | DQ data bus from PHY              |
| PHY_OUT_DQ1          | 7:0          | DQ data bus from PHY              |
| PHY_OUT_DQ2          | 7:0          | DQ data bus from PHY              |
| PHY_OUT_DQ3          | 7:0          | DQ data bus from PHY              |
| PHY_OUT_DQ_OEN0      | 7:0          | Enable for DQ output from PHY     |
| PHY_OUT_DQ_OEN1      | 7:0          | Enable for DQ output from PHY     |
| PHY_OUT_DQ_OEN2      | 7:0          | Enable for DQ output from PHY     |
| PHY_OUT_DQ_OEN3      | 7:0          | Enable for DQ output from PHY     |
| PHY_OUT_DM0          | 1            | DM (Data Mask) from PHY           |
| PHY_OUT_DM1          | 1            | DM (Data Mask) from PHY           |
| PHY_OUT_DM2          | 1            | DM (Data Mask) from PHY           |
| PHY_OUT_DM3          | 1            | DM (Data Mask) from PHY           |
| PHY_OUT_DM_OEN0      | 1            | Enable for DM output from PHY     |
| PHY_OUT_DM_OEN1      | 1            | Enable for DM output from PHY     |
| PHY_OUT_DM_OEN2      | 1            | Enable for DM output from PHY     |
| PHY_OUT_DM_OEN3      | 1            | Enable for DM output from PHY     |
| PHY_OUT_DQS0         | 1            | DQS data strobe from PHY          |
| PHY_OUT_DQS1         | 1            | DQS data strobe from PHY          |
| PHY_OUT_DQS2         | 1            | DQS data strobe from PHY          |

**Table 133: Output Ports (Continued)**

| <b>Name</b>      | <b>Range</b> | <b>Description</b>                                                                                    |
|------------------|--------------|-------------------------------------------------------------------------------------------------------|
| PHY_OUT_DQS3     | 1            | DQS data strobe from PHY                                                                              |
| PHY_OUT_DQS_OEN0 | 1            | Enable for DQS output from PHY                                                                        |
| PHY_OUT_DQS_OEN1 | 1            | Enable for DQS output from PHY                                                                        |
| PHY_OUT_DQS_OEN2 | 1            | Enable for DQS output from PHY                                                                        |
| PHY_OUT_DQS_OEN3 | 1            | Enable for DQS output from PHY                                                                        |
| DQ_READ0         | 7:0          | FPGA IO ODT Enable For Data                                                                           |
| DQ_READ1         | 7:0          | FPGA IO ODT Enable For Data                                                                           |
| DQ_READ2         | 7:0          | FPGA IO ODT Enable For Data                                                                           |
| DQ_READ3         | 7:0          | FPGA IO ODT Enable For Data                                                                           |
| DM_READ0         | 1            | FPGA IO ODT enable for data mask                                                                      |
| DM_READ1         | 1            | FPGA IO ODT enable for data mask                                                                      |
| DM_READ2         | 1            | FPGA IO ODT enable for data mask                                                                      |
| DM_READ3         | 1            | FPGA IO ODT enable for data mask                                                                      |
| DQS_READ0        | 1            | FPGA IO ODT enable for data strobe                                                                    |
| DQS_READ1        | 1            | FPGA IO ODT enable for data strobe                                                                    |
| DQS_READ2        | 1            | FPGA IO ODT enable for data strobe                                                                    |
| DQS_READ3        | 1            | FPGA IO ODT enable for data strobe                                                                    |
| DQ_IE0           | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DQ_IE1           | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DQ_IE2           | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DQ_IE3           | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DM_IE0           | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE1           | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE2           | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE3           | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DQS_IE0          | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |

**Table 133: Output Ports (Continued)**

| Name                | Range | Description                                                        |
|---------------------|-------|--------------------------------------------------------------------|
| DQS_IE1             | 1     | Optional dynamic input enable for DQS IO receivers during reads    |
| DQS_IE2             | 1     | Optional dynamic input enable for DQS IO receivers during reads    |
| DQS_IE3             | 1     | Optional dynamic input enable for DQS IO receivers during reads    |
| VREF_OUTPUT_ENABLE0 | 1     | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE1 | 1     | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE2 | 1     | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE3 | 1     | Global control input to enable/disable VREF generation if required |
| VREF_VALUE0         | 6:0   | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE1         | 6:0   | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE2         | 6:0   | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE3         | 6:0   | Vref value set for each byte lane - width can be customized        |
| CA_OUT_CLK0         | 1     | DRAM clock output from PHY                                         |
| CA_OUT_CLK1         | 1     | DRAM clock output from PHY                                         |
| CA_OUT_RST_N        | 1     | DRAM reset output from PHY                                         |
| CA_OUT_A0           | 1     | DRAM MA output from PHY                                            |
| CA_OUT_A1           | 1     | DRAM MA output from PHY                                            |
| CA_OUT_A2           | 1     | DRAM MA output from PHY                                            |
| CA_OUT_A3           | 1     | DRAM MA output from PHY                                            |
| CA_OUT_A4           | 1     | DRAM MA output from PHY                                            |
| CA_OUT_A5           | 1     | DRAM MA output from PHY                                            |
| CA_OUT_CS_N         | 1:0   | DRAM CS_N output from PHY                                          |
| CA_OUT_CKE          | 1:0   | DRAM CKE output from PHY                                           |
| CA_OUT_CS_OEN       | 1     | DDR5 mode register bit                                             |
| CA_OUT_CLK_OEN0     | 1     | Disable mclk output                                                |
| CA_OUT_CLK_OEN1     | 1     | Disable mclk output                                                |
| VREF_CA_VALUE       | 6:0   | VREF value driven for CA IOs                                       |

**Table 133: Output Ports (Continued)**

| Name                                | Range | Description                                                                                   |
|-------------------------------------|-------|-----------------------------------------------------------------------------------------------|
| UPDATE                              | 1     | Pulsed to indicate that the last TX & RX calibrated trim value may be driven on the pad-ring  |
| ADDR_CTRL_LOPHY_OUTBACK_RCV<br>R_EN | 1     | Used to enable loopback test on Address/Control/Clock (CA) IOs                                |
| ADDR_CTRL_VREF_OUTPUT_ENABLE        | 1     | VREF output enable                                                                            |
| ADRCTRL_DRIVERS_OEN                 | 1     | DDRPHY IP tristate output to PIC DDRPHY command address tristate control DDRPHY_TO            |
| RECEIVER_EN0                        | 1     | IO will connect to stdby_inr_cib to support memory & non-memory; Bank based & User Controlled |
| RECEIVER_EN1                        | 1     | IO will connect to stdby_inr_cib to support memory & non-memory; Bank based & User Controlled |
| RECEIVER_EN2                        | 1     | IO will connect to stdby_inr_cib to support memory & non-memory; Bank based & User Controlled |
| RECEIVER_EN3                        | 1     | IO will connect to stdby_inr_cib to support memory & non-memory; Bank based & User Controlled |

**Table 134: Parameters**

| Name          | Values                                                   | Description                                                                                                 |
|---------------|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| RATE          | "HALF" (default)<br>"FULL"                               | DDR rate                                                                                                    |
| PROTOCOL      | "LPDDR4" (default)                                       | DDR protocol                                                                                                |
| EXT_RES       | "PER_BANK" (default)<br>"PER_DDRPHY"                     | External Resistor for PVT Cal                                                                               |
| IO_CAL_UPDATE | "CONTINUOUS" (default)<br>"ONE TIME"<br>"CONTROL_UPDATE" | Continuous IO calibration update<br>One-time IO calibration update<br>User-controlled IO calibration update |

## DDRPHY40D

Supports DDR4 and DDR3L protocols with X40 data width

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

| DFI_RDDATA_VALID1    | 1     | DDRPHY Read Data Valid            |
| DFI_RDDATA_VALID2    | 1     | DDRPHY Read Data Valid            |
| DFI_RDDATA_VALID3    | 1     | DDRPHY Read Data Valid            |
| DFI_RDDATA_VALID4    | 1     | DDRPHY Read Data Valid            |
| DFI_RDDATA_VALID0_P2 | 1     | DDRPHY Read Data Valid P2P3       |
| DFI_RDDATA_VALID1_P2 | 1     | DDRPHY Read Data Valid P2P3       |
| DFI_RDDATA_VALID2_P2 | 1     | DDRPHY Read Data Valid P2P3       |
| DFI_RDDATA_VALID3_P2 | 1     | DDRPHY Read Data Valid P2P3       |
| DFI_RDDATA_VALID4_P2 | 1     | DDRPHY Read Data Valid P2P3       |
| DFI_PHYUPD_REQ       | 1     | DDRPHY PHY Update Request         |
| DFI_PHYUPD_TYPE      | 1:0   | DDRPHY PHY Update Type            |
| DFI_CTRLUPD_ACK      | 1     | DDRPHY Control Update Acknowledge |
| DFIIT_COMPLETE       | 1     | DDRPHY Initialization Complete    |
| AXB_READY            | 1     | AXB bus interface: Read Enable    |
| AXB_RDATA            | 31:0  | AXB bus interface: Read Data      |
| PHY_OUT_DQ0          | 7:0   | DQ data bus from PHY              |
| PHY_OUT_DQ1          | 7:0   | DQ data bus from PHY              |
| PHY_OUT_DQ2          | 7:0   | DQ data bus from PHY              |
| PHY_OUT_DQ3          | 7:0   | DQ data bus from PHY              |
| PHY_OUT_DQ4          | 7:0   | DQ data bus from PHY              |
| PHY_OUT_DQ_OEN0      | 7:0   | Enable for DQ output from PHY     |
| PHY_OUT_DQ_OEN1      | 7:0   | Enable for DQ output from PHY     |
| PHY_OUT_DQ_OEN2      | 7:0   | Enable for DQ output from PHY     |
| PHY_OUT_DQ_OEN3      | 7:0   | Enable for DQ output from PHY     |
| PHY_OUT_DQ_OEN4      | 7:0   | Enable for DQ output from PHY     |
| PHY_OUT_DM0          | 1     | DM (Data Mask) from PHY           |

**Table 136: Output Ports (Continued)**

| Name             | Range | Description                        |
|------------------|-------|------------------------------------|
| PHY_OUT_DM1      | 1     | DM (Data Mask) from PHY            |
| PHY_OUT_DM2      | 1     | DM (Data Mask) from PHY            |
| PHY_OUT_DM3      | 1     | DM (Data Mask) from PHY            |
| PHY_OUT_DM4      | 1     | DM (Data Mask) from PHY            |
| PHY_OUT_DM_OEN0  | 1     | Enable for DM output from PHY      |
| PHY_OUT_DM_OEN1  | 1     | Enable for DM output from PHY      |
| PHY_OUT_DM_OEN2  | 1     | Enable for DM output from PHY      |
| PHY_OUT_DM_OEN3  | 1     | Enable for DM output from PHY      |
| PHY_OUT_DM_OEN4  | 1     | Enable for DM output from PHY      |
| PHY_OUT_DQS0     | 1     | DQS data strobe from PHY           |
| PHY_OUT_DQS1     | 1     | DQS data strobe from PHY           |
| PHY_OUT_DQS2     | 1     | DQS data strobe from PHY           |
| PHY_OUT_DQS3     | 1     | DQS data strobe from PHY           |
| PHY_OUT_DQS4     | 1     | DQS data strobe from PHY           |
| PHY_OUT_DQS_OEN0 | 1     | Enable for DQS output from PHY     |
| PHY_OUT_DQS_OEN1 | 1     | Enable for DQS output from PHY     |
| PHY_OUT_DQS_OEN2 | 1     | Enable for DQS output from PHY     |
| PHY_OUT_DQS_OEN3 | 1     | Enable for DQS output from PHY     |
| PHY_OUT_DQS_OEN4 | 1     | Enable for DQS output from PHY     |
| DQ_READ0         | 7:0   | FPGA IO ODT Enable For Data        |
| DQ_READ1         | 7:0   | FPGA IO ODT Enable For Data        |
| DQ_READ2         | 7:0   | FPGA IO ODT Enable For Data        |
| DQ_READ3         | 7:0   | FPGA IO ODT Enable For Data        |
| DQ_READ4         | 7:0   | FPGA IO ODT Enable For Data        |
| DM_READ0         | 1     | FPGA IO ODT enable for data mask   |
| DM_READ1         | 1     | FPGA IO ODT enable for data mask   |
| DM_READ2         | 1     | FPGA IO ODT enable for data mask   |
| DM_READ3         | 1     | FPGA IO ODT enable for data mask   |
| DM_READ4         | 1     | FPGA IO ODT enable for data mask   |
| DQS_READ0        | 1     | FPGA IO ODT enable for data strobe |
| DQS_READ1        | 1     | FPGA IO ODT enable for data strobe |
| DQS_READ2        | 1     | FPGA IO ODT enable for data strobe |

**Table 136: Output Ports (Continued)**

| <b>Name</b>         | <b>Range</b> | <b>Description</b>                                                                                    |
|---------------------|--------------|-------------------------------------------------------------------------------------------------------|
| DQS_READ3           | 1            | FPGA IO ODT enable for data strobe                                                                    |
| DQS_READ4           | 1            | FPGA IO ODT enable for data strobe                                                                    |
| DQ_IE0              | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DQ_IE1              | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DQ_IE2              | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DQ_IE3              | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DQ_IE4              | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DM_IE0              | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE1              | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE2              | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE3              | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE4              | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DQS_IE0             | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE1             | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE2             | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE3             | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE4             | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| VREF_OUTPUT_ENABLE0 | 1            | Global control input to enable/disable VREF generation if required                                    |
| VREF_OUTPUT_ENABLE1 | 1            | Global control input to enable/disable VREF generation if required                                    |
| VREF_OUTPUT_ENABLE2 | 1            | Global control input to enable/disable VREF generation if required                                    |
| VREF_OUTPUT_ENABLE3 | 1            | Global control input to enable/disable VREF generation if required                                    |

**Table 136: Output Ports (Continued)**

| <b>Name</b>         | <b>Range</b> | <b>Description</b>                                                 |
|---------------------|--------------|--------------------------------------------------------------------|
| VREF_OUTPUT_ENABLE4 | 1            | Global control input to enable/disable VREF generation if required |
| VREF_VALUE0         | 6:0          | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE1         | 6:0          | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE2         | 6:0          | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE3         | 6:0          | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE4         | 6:0          | Vref value set for each byte lane - width can be customized        |
| CA_OUT_CLK0         | 1            | DRAM clock output from PHY                                         |
| CA_OUT_CLK1         | 1            | DRAM clock output from PHY                                         |
| CA_OUT_RST_N        | 1            | DRAM reset output from PHY                                         |
| CA_OUT_A0           | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A1           | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A2           | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A3           | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A4           | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A5           | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A6           | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A7           | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A8           | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A9           | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A10          | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A11          | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A12          | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A13          | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A14          | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A15          | 1            | DRAM MA output from PHY                                            |
| CA_OUT_A16          | 1            | DRAM MA output from PHY                                            |
| CA_OUT_CS_N         | 1:0          | DRAM CS_N output from PHY                                          |
| CA_OUT_CKE          | 1:0          | DRAM CKE output from PHY                                           |
| CA_OUT_BA2          | 1            | DRAM BA output from PHY                                            |

**Table 136: Output Ports (Continued)**

| Name                             | Range | Description                                                                                   |
|----------------------------------|-------|-----------------------------------------------------------------------------------------------|
| CA_OUT_BA1                       | 1     | DRAM BA output from PHY                                                                       |
| CA_OUT_BA0                       | 1     | DRAM BA output from PHY                                                                       |
| CA_OUT_RAS_N                     | 1     | DRAM RAS_N output from PHY                                                                    |
| CA_OUT_CAS_N                     | 1     | DRAM CAS_N output from PHY                                                                    |

| CA_OUT_ODT                       | 1:0   | DRAM ODT output from PHY                                                                      |
| CA_OUT_CS_OEN                    | 1     | DDR5 mode register bit                                                                        |
| CA_OUT_CLK_OEN0                  | 1     | Disable MCLK output                                                                           |
| CA_OUT_CLK_OEN1                  | 1     | Disable MCLK output                                                                           |
| VREF_CA_VALUE                    | 6:0   | VREF value driven for CA IOs                                                                  |
| UPDATE                           | 1     | Pulsed to indicate that the last TX & RX calibrated trim value may be driven on the pad-ring  |
| ADDR_CTRL_LOPHY_OUTBACK_RCV_R_EN | 1     | Used to enable loopback test on Address/Control/Clock (CA) IOs                                |
| ADDR_CTRL_VREF_OUTPUT_ENABLE     | 1     | VREF output enable                                                                            |
| ADRCTRL_DRIVERS_OEN              | 1     | DDRPHY IP tristate output to PIC DDRPHY command address tristate control DDRPHY_TO            |
| RECEIVER_EN0                     | 1     | IO will connect to stdby_inr_cib to support memory & non-memory; Bank based & User Controlled |
| RECEIVER_EN1                     | 1     | IO will connect to stdby_inr_cib to support memory & non-memory; Bank based & User Controlled |
| RECEIVER_EN2                     | 1     | IO will connect to stdby_inr_cib to support memory & non-memory; Bank based & User Controlled |
| RECEIVER_EN3                     | 1     | IO will connect to stdby_inr_cib to support memory & non-memory; Bank based & User Controlled |
| RECEIVER_EN4                     | 1     | IO will connect to stdby_inr_cib to support memory & non-memory; Bank based & User Controlled |

**Table 137: Parameters**

| Name     | Values                      | Description  |
|----------|-----------------------------|--------------|
| RATE     | "HALF" (default)<br>"FULL"  | DDR rate     |
| PROTOCOL | "DDR3L" (default)<br>"DDR4" | DDR protocol |

**Table 137: Parameters (Continued)**

| Name          | Values                                                   | Description                                                                                                 |
|---------------|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| EXT_RES       | "PER_BANK" (default)<br>"PER_DDRPHY"                     | External Resistor for PVT Cal                                                                               |
| IO_CAL_UPDATE | "CONTINUOUS" (default)<br>"ONE TIME"<br>"CONTROL_UPDATE" | Continuous IO calibration update<br>One-time IO calibration update<br>User-controlled IO calibration update |

## DDRPHY64D

Supports DDR4 and DDR3L protocols with X64 data width

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

|                           |                                 |

| <b>Name</b> | <b>Range</b> | <b>Description</b>                                                                                    |
|-------------|--------------|-------------------------------------------------------------------------------------------------------|
| DQS_READ6   | 1            | FPGA IO ODT enable for data strobe                                                                    |
| DQS_READ7   | 1            | FPGA IO ODT enable for data strobe                                                                    |
| DQ_IE0      | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DQ_IE1      | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DQ_IE2      | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DQ_IE3      | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DQ_IE4      | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DQ_IE5      | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DQ_IE6      | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DQ_IE7      | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DM_IE0      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE1      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE2      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE3      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE4      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE5      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE6      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE7      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DQS_IE0     | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE1     | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE2     | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |

**Table 139: Output Ports (Continued)**

| <b>Name</b>         | <b>Range</b> | <b>Description</b>                                                 |
|---------------------|--------------|--------------------------------------------------------------------|
| DQS_IE3             | 1            | Optional dynamic input enable for DQS IO receivers during reads    |
| DQS_IE4             | 1            | Optional dynamic input enable for DQS IO receivers during reads    |
| DQS_IE5             | 1            | Optional dynamic input enable for DQS IO receivers during reads    |
| DQS_IE6             | 1            | Optional dynamic input enable for DQS IO receivers during reads    |
| DQS_IE7             | 1            | Optional dynamic input enable for DQS IO receivers during reads    |
| VREF_OUTPUT_ENABLE0 | 1            | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE1 | 1            | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE2 | 1            | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE3 | 1            | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE4 | 1            | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE5 | 1            | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE6 | 1            | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE7 | 1            | Global control input to enable/disable VREF generation if required |
| VREF_VALUE0         | 6:0          | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE1         | 6:0          | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE2         | 6:0          | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE3         | 6:0          | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE4         | 6:0          | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE5         | 6:0          | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE6         | 6:0          | Vref value set for each byte lane - width can be customized        |

**Table 139: Output Ports (Continued)**

| <b>Name</b>   | <b>Range</b> | <b>Description</b>                                          |
|---------------|--------------|-------------------------------------------------------------|
| VREF_VALUE7   | 6:0          | Vref value set for each byte lane - width can be customized |
| CA_OUT_CLK0   | 1            | DRAM clock output from PHY                                  |
| CA_OUT_CLK1   | 1            | DRAM clock output from PHY                                  |
| CA_OUT_RST_N  | 1            | DRAM reset output from PHY                                  |
| CA_OUT_A0     | 1            | DRAM MA output from PHY                                     |
| CA_OUT_A1     | 1            | DRAM MA output from PHY                                     |
| CA_OUT_A2     | 1            | DRAM MA output from PHY                                     |
| CA_OUT_A3     | 1            | DRAM MA output from PHY                                     |
| CA_OUT_A4     | 1            | DRAM MA output from PHY                                     |
| CA_OUT_A5     | 1            | DRAM MA output from PHY                                     |
| CA_OUT_A6     | 1            | DRAM MA output from PHY                                     |
| CA_OUT_A7     | 1            | DRAM MA output from PHY                                     |
| CA_OUT_A8     | 1            | DRAM MA output from PHY                                     |
| CA_OUT_A9     | 1            | DRAM MA output from PHY                                     |
| CA_OUT_A10    | 1            | DRAM MA output from PHY                                     |
| CA_OUT_A11    | 1            | DRAM MA output from PHY                                     |
| CA_OUT_A12    | 1            | DRAM MA output from PHY                                     |
| CA_OUT_A13    | 1            | DRAM MA output from PHY                                     |
| CA_OUT_A14    | 1            | DRAM MA output from PHY                                     |
| CA_OUT_A15    | 1            | DRAM MA output from PHY                                     |
| CA_OUT_A16    | 1            | DRAM MA output from PHY                                     |
| CA_OUT_CS_N   | 1:0          | DRAM CS_N output from PHY                                   |
| CA_OUT_CKE    | 1:0          | DRAM CKE output from PHY                                    |
| CA_OUT_BA2    | 1            | DRAM BA output from PHY                                     |
| CA_OUT_BA1    | 1            | DRAM BA output from PHY                                     |
| CA_OUT_BA0    | 1            | DRAM BA output from PHY                                     |
| CA_OUT_RAS_N  | 1            | DRAM RAS_N output from PHY                                  |
| CA_OUT_CAS_N  | 1            | DRAM CAS_N output from PHY                                  |
| CA_OUT_WE_N   | 1            | DRAM WE_N output from PHY                                   |
| CA_OUT_ODT    | 1:0          | DRAM ODT output from PHY                                    |
| CA_OUT_CS_OEN | 1            | DDR5 mode register bit                                      |

**Table 139: Output Ports (Continued)**

| Name                                | Range | Description                                                                                   |
|-------------------------------------|-------|-----------------------------------------------------------------------------------------------|
| CA_OUT_CLK_OEN0                     | 1     | Disable MCLK output                                                                           |
| CA_OUT_CLK_OEN1                     | 1     | Disable MCLK output                                                                           |
| VREF_CA_VALUE                       | 6:0   | VREF value driven for CA IOs                                                                  |
| UPDATE                              | 1     | Pulsed to indicate that the last TX & RX calibrated trim value may be driven on the pad-ring  |
| ADDR_CTRL_LOPHY_OUTBACK_RCV<br>R_EN | 1     | Used to enable loopback test on Address/Control/Clock (CA) IOs                                |
| ADDR_CTRL_VREF_OUTPUT_ENABLE        | 1     | VREF output enable                                                                            |
| ADRCtrl_DRIVERS_OEN                 | 1     | DDRPHY IP tristate output to PIC DDRPHY command address tristate control DDRPHY_TO            |
| RECEIVER_EN0                        | 1     | IO will connect to stdby_inr_cib to support memory & non-memory; Bank based & User Controlled |
| RECEIVER_EN1                        | 1     | IO will connect to stdby_inr_cib to support memory & non-memory; Bank based & User Controlled |
| RECEIVER_EN2                        | 1     | IO will connect to stdby_inr_cib to support memory & non-memory; Bank based & User Controlled |
| RECEIVER_EN3                        | 1     | IO will connect to stdby_inr_cib to support memory & non-memory; Bank based & User Controlled |
| RECEIVER_EN4                        | 1     | IO will connect to stdby_inr_cib to support memory & non-memory; Bank based & User Controlled |
| RECEIVER_EN5                        | 1     | IO will connect to stdby_inr_cib to support memory & non-memory; Bank based & User Controlled |
| RECEIVER_EN6                        | 1     | IO will connect to stdby_inr_cib to support memory & non-memory; Bank based & User Controlled |
| RECEIVER_EN7                        | 1     | IO will connect to stdby_inr_cib to support memory & non-memory; Bank based & User Controlled |

**Table 140: Parameters**

| Name     | Values                      | Description  |
|----------|-----------------------------|--------------|
| RATE     | "HALF" (default)<br>"FULL"  | DDR rate     |
| PROTOCOL | "DDR3L" (default)<br>"DDR4" | DDR protocol |

**Table 140: Parameters (Continued)**

| Name          | Values                                                   | Description                                                                                                 |
|---------------|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| EXT_RES       | "PER_BANK" (default)<br>"PER_DDRPHY"                     | External Resistor for PVT Cal                                                                               |
| IO_CAL_UPDATE | "CONTINUOUS" (default)<br>"ONE TIME"<br>"CONTROL_UPDATE" | Continuous IO calibration update<br>One-time IO calibration update<br>User-controlled IO calibration update |

## DDRPHY64E

Supports LPDDR4 protocol with X64 data width

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

|                             |                                 |

| PHY_OUT_DQ4          | 7:0   | DQ data bus from PHY              |
| PHY_OUT_DQ5          | 7:0   | DQ data bus from PHY              |
| PHY_OUT_DQ6          | 7:0   | DQ data bus from PHY              |
| PHY_OUT_DQ7          | 7:0   | DQ data bus from PHY              |
| PHY_OUT_DQ_OEN0      | 7:0   | Enable for DQ output from PHY     |
| PHY_OUT_DQ_OEN1      | 7:0   | Enable for DQ output from PHY     |
| PHY_OUT_DQ_OEN2      | 7:0   | Enable for DQ output from PHY     |
| PHY_OUT_DQ_OEN3      | 7:0   | Enable for DQ output from PHY     |
| PHY_OUT_DQ_OEN4      | 7:0   | Enable for DQ output from PHY     |
| PHY_OUT_DQ_OEN5      | 7:0   | Enable for DQ output from PHY     |

**Table 142: Output Ports (Continued)**

| <b>Name</b>      | <b>Range</b> | <b>Description</b>             |
|------------------|--------------|--------------------------------|
| PHY_OUT_DQ_OEN6  | 7:0          | Enable for DQ output from PHY  |
| PHY_OUT_DQ_OEN7  | 7:0          | Enable for DQ output from PHY  |
| PHY_OUT_DM0      | 1            | DM (Data Mask) from PHY        |
| PHY_OUT_DM1      | 1            | DM (Data Mask) from PHY        |
| PHY_OUT_DM2      | 1            | DM (Data Mask) from PHY        |
| PHY_OUT_DM3      | 1            | DM (Data Mask) from PHY        |
| PHY_OUT_DM4      | 1            | DM (Data Mask) from PHY        |
| PHY_OUT_DM5      | 1            | DM (Data Mask) from PHY        |
| PHY_OUT_DM6      | 1            | DM (Data Mask) from PHY        |
| PHY_OUT_DM7      | 1            | DM (Data Mask) from PHY        |
| PHY_OUT_DM_OEN0  | 1            | Enable for DM output from PHY  |
| PHY_OUT_DM_OEN1  | 1            | Enable for DM output from PHY  |
| PHY_OUT_DM_OEN2  | 1            | Enable for DM output from PHY  |
| PHY_OUT_DM_OEN3  | 1            | Enable for DM output from PHY  |
| PHY_OUT_DM_OEN4  | 1            | Enable for DM output from PHY  |
| PHY_OUT_DM_OEN5  | 1            | Enable for DM output from PHY  |
| PHY_OUT_DM_OEN6  | 1            | Enable for DM output from PHY  |
| PHY_OUT_DM_OEN7  | 1            | Enable for DM output from PHY  |
| PHY_OUT_DQS0     | 1            | DQS data strobe from PHY       |
| PHY_OUT_DQS1     | 1            | DQS data strobe from PHY       |
| PHY_OUT_DQS2     | 1            | DQS data strobe from PHY       |
| PHY_OUT_DQS3     | 1            | DQS data strobe from PHY       |
| PHY_OUT_DQS4     | 1            | DQS data strobe from PHY       |
| PHY_OUT_DQS5     | 1            | DQS data strobe from PHY       |
| PHY_OUT_DQS6     | 1            | DQS data strobe from PHY       |
| PHY_OUT_DQS7     | 1            | DQS data strobe from PHY       |
| PHY_OUT_DQS_OEN0 | 1            | Enable for DQS output from PHY |
| PHY_OUT_DQS_OEN1 | 1            | Enable for DQS output from PHY |
| PHY_OUT_DQS_OEN2 | 1            | Enable for DQS output from PHY |
| PHY_OUT_DQS_OEN3 | 1            | Enable for DQS output from PHY |
| PHY_OUT_DQS_OEN4 | 1            | Enable for DQS output from PHY |
| PHY_OUT_DQS_OEN5 | 1            | Enable for DQS output from PHY |

**Table 142: Output Ports (Continued)**

| <b>Name</b>      | <b>Range</b> | <b>Description</b>                                             |
|------------------|--------------|----------------------------------------------------------------|
| PHY_OUT_DQS_OEN6 | 1            | Enable for DQS output from PHY                                 |
| PHY_OUT_DQS_OEN7 | 1            | Enable for DQS output from PHY                                 |
| DQ_READ0         | 7:0          | FPGA IO ODT Enable For Data                                    |
| DQ_READ1         | 7:0          | FPGA IO ODT Enable For Data                                    |
| DQ_READ2         | 7:0          | FPGA IO ODT Enable For Data                                    |
| DQ_READ3         | 7:0          | FPGA IO ODT Enable For Data                                    |
| DQ_READ4         | 7:0          | FPGA IO ODT Enable For Data                                    |
| DQ_READ5         | 7:0          | FPGA IO ODT Enable For Data                                    |
| DQ_READ6         | 7:0          | FPGA IO ODT Enable For Data                                    |
| DQ_READ7         | 7:0          | FPGA IO ODT Enable For Data                                    |
| DM_READ0         | 1            | FPGA IO ODT enable for data mask                               |
| DM_READ1         | 1            | FPGA IO ODT enable for data mask                               |
| DM_READ2         | 1            | FPGA IO ODT enable for data mask                               |
| DM_READ3         | 1            | FPGA IO ODT enable for data mask                               |
| DM_READ4         | 1            | FPGA IO ODT enable for data mask                               |
| DM_READ5         | 1            | FPGA IO ODT enable for data mask                               |
| DM_READ6         | 1            | FPGA IO ODT enable for data mask                               |
| DM_READ7         | 1            | FPGA IO ODT enable for data mask                               |
| DQS_READ0        | 1            | FPGA IO ODT enable for data strobe                             |
| DQS_READ1        | 1            | FPGA IO ODT enable for data strobe                             |
| DQS_READ2        | 1            | FPGA IO ODT enable for data strobe                             |
| DQS_READ3        | 1            | FPGA IO ODT enable for data strobe                             |
| DQS_READ4        | 1            | FPGA IO ODT enable for data strobe                             |
| DQS_READ5        | 1            | FPGA IO ODT enable for data strobe                             |
| DQS_READ6        | 1            | FPGA IO ODT enable for data strobe                             |
| DQS_READ7        | 1            | FPGA IO ODT enable for data strobe                             |
| DQ_IE0           | 7:0          | Optional dynamic input enable for DQ IO receivers during reads |
| DQ_IE1           | 7:0          | Optional dynamic input enable for DQ IO receivers during reads |
| DQ_IE2           | 7:0          | Optional dynamic input enable for DQ IO receivers during reads |
| DQ_IE3           | 7:0          | Optional dynamic input enable for DQ IO receivers during reads |

**Table 142: Output Ports (Continued)**

| <b>Name</b> | <b>Range</b> | <b>Description</b>                                                                                    |
|-------------|--------------|-------------------------------------------------------------------------------------------------------|
| DQ_IE4      | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DQ_IE5      | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DQ_IE6      | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DQ_IE7      | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DM_IE0      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE1      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE2      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE3      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE4      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE5      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE6      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE7      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DQS_IE0     | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE1     | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE2     | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE3     | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE4     | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE5     | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE6     | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE7     | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |

**Table 142: Output Ports (Continued)**

| Name                | Range | Description                                                        |
|---------------------|-------|--------------------------------------------------------------------|
| VREF_OUTPUT_ENABLE0 | 1     | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE1 | 1     | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE2 | 1     | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE3 | 1     | Global control input to enable/disable VREF generation if required |

## DDRPHY72D

Supports DDR4 and DDR3L protocols with X72 data width

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

|                             |                                 |

| PHY_OUT_DM5     | 1            | DM (Data Mask) from PHY         |
| PHY_OUT_DM6     | 1            | DM (Data Mask) from PHY         |
| PHY_OUT_DM7     | 1            | DM (Data Mask) from PHY         |
| PHY_OUT_DM8     | 1            | DM (Data Mask) from PHY         |
| PHY_OUT_DM_OEN0 | 1            | Enable for DM output from PHY   |
| PHY_OUT_DM_OEN1 | 1            | Enable for DM output from PHY   |

**Table 145: Output Ports (Continued)**

| <b>Name</b>      | <b>Range</b> | <b>Description</b>             |
|------------------|--------------|--------------------------------|
| PHY_OUT_DM_OEN2  | 1            | Enable for DM output from PHY  |
| PHY_OUT_DM_OEN3  | 1            | Enable for DM output from PHY  |
| PHY_OUT_DM_OEN4  | 1            | Enable for DM output from PHY  |
| PHY_OUT_DM_OEN5  | 1            | Enable for DM output from PHY  |
| PHY_OUT_DM_OEN6  | 1            | Enable for DM output from PHY  |
| PHY_OUT_DM_OEN7  | 1            | Enable for DM output from PHY  |
| PHY_OUT_DM_OEN8  | 1            | Enable for DM output from PHY  |
| PHY_OUT_DQS0     | 1            | DQS data strobe from PHY       |
| PHY_OUT_DQS1     | 1            | DQS data strobe from PHY       |
| PHY_OUT_DQS2     | 1            | DQS data strobe from PHY       |
| PHY_OUT_DQS3     | 1            | DQS data strobe from PHY       |
| PHY_OUT_DQS4     | 1            | DQS data strobe from PHY       |
| PHY_OUT_DQS5     | 1            | DQS data strobe from PHY       |
| PHY_OUT_DQS6     | 1            | DQS data strobe from PHY       |
| PHY_OUT_DQS7     | 1            | DQS data strobe from PHY       |
| PHY_OUT_DQS8     | 1            | DQS data strobe from PHY       |
| PHY_OUT_DQS_OEN0 | 1            | Enable for DQS output from PHY |
| PHY_OUT_DQS_OEN1 | 1            | Enable for DQS output from PHY |
| PHY_OUT_DQS_OEN2 | 1            | Enable for DQS output from PHY |
| PHY_OUT_DQS_OEN3 | 1            | Enable for DQS output from PHY |
| PHY_OUT_DQS_OEN4 | 1            | Enable for DQS output from PHY |
| PHY_OUT_DQS_OEN5 | 1            | Enable for DQS output from PHY |
| PHY_OUT_DQS_OEN6 | 1            | Enable for DQS output from PHY |
| PHY_OUT_DQS_OEN7 | 1            | Enable for DQS output from PHY |
| PHY_OUT_DQS_OEN8 | 1            | Enable for DQS output from PHY |
| DQ_READ0         | 7:0          | FPGA IO ODT Enable For Data    |
| DQ_READ1         | 7:0          | FPGA IO ODT Enable For Data    |
| DQ_READ2         | 7:0          | FPGA IO ODT Enable For Data    |
| DQ_READ3         | 7:0          | FPGA IO ODT Enable For Data    |
| DQ_READ4         | 7:0          | FPGA IO ODT Enable For Data    |
| DQ_READ5         | 7:0          | FPGA IO ODT Enable For Data    |
| DQ_READ6         | 7:0          | FPGA IO ODT Enable For Data    |

**Table 145: Output Ports (Continued)**

| <b>Name</b> | <b>Range</b> | <b>Description</b>                                             |
|-------------|--------------|----------------------------------------------------------------|
| DQ_READ7    | 7:0          | FPGA IO ODT Enable For Data                                    |
| DQ_READ8    | 7:0          | FPGA IO ODT Enable For Data                                    |
| DM_READ0    | 1            | FPGA IO ODT enable for data mask                               |
| DM_READ1    | 1            | FPGA IO ODT enable for data mask                               |
| DM_READ2    | 1            | FPGA IO ODT enable for data mask                               |
| DM_READ3    | 1            | FPGA IO ODT enable for data mask                               |
| DM_READ4    | 1            | FPGA IO ODT enable for data mask                               |
| DM_READ5    | 1            | FPGA IO ODT enable for data mask                               |
| DM_READ6    | 1            | FPGA IO ODT enable for data mask                               |
| DM_READ7    | 1            | FPGA IO ODT enable for data mask                               |
| DM_READ8    | 1            | FPGA IO ODT enable for data mask                               |
| DQS_READ0   | 1            | FPGA IO ODT enable for data strobe                             |
| DQS_READ1   | 1            | FPGA IO ODT enable for data strobe                             |
| DQS_READ2   | 1            | FPGA IO ODT enable for data strobe                             |
| DQS_READ3   | 1            | FPGA IO ODT enable for data strobe                             |
| DQS_READ4   | 1            | FPGA IO ODT enable for data strobe                             |
| DQS_READ5   | 1            | FPGA IO ODT enable for data strobe                             |
| DQS_READ6   | 1            | FPGA IO ODT enable for data strobe                             |
| DQS_READ7   | 1            | FPGA IO ODT enable for data strobe                             |
| DQS_READ8   | 1            | FPGA IO ODT enable for data strobe                             |
| DQ_IE0      | 7:0          | Optional dynamic input enable for DQ IO receivers during reads |
| DQ_IE1      | 7:0          | Optional dynamic input enable for DQ IO receivers during reads |
| DQ_IE2      | 7:0          | Optional dynamic input enable for DQ IO receivers during reads |
| DQ_IE3      | 7:0          | Optional dynamic input enable for DQ IO receivers during reads |
| DQ_IE4      | 7:0          | Optional dynamic input enable for DQ IO receivers during reads |
| DQ_IE5      | 7:0          | Optional dynamic input enable for DQ IO receivers during reads |
| DQ_IE6      | 7:0          | Optional dynamic input enable for DQ IO receivers during reads |

**Table 145: Output Ports (Continued)**

| <b>Name</b> | <b>Range</b> | <b>Description</b>                                                                                    |
|-------------|--------------|-------------------------------------------------------------------------------------------------------|
| DQ_IE7      | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DQ_IE8      | 7:0          | Optional dynamic input enable for DQ IO receivers during reads                                        |
| DM_IE0      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE1      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE2      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE3      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE4      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE5      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE6      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE7      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DM_IE8      | 1            | Optional dynamic input enable for DM/DBI IO receivers during reads (00,01,10 controlled by PHY/CTRLR) |
| DQS_IE0     | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE1     | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE2     | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE3     | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE4     | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE5     | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE6     | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE7     | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |
| DQS_IE8     | 1            | Optional dynamic input enable for DQS IO receivers during reads                                       |

**Table 145: Output Ports (Continued)**

| Name                | Range | Description                                                        |
|---------------------|-------|--------------------------------------------------------------------|
| VREF_OUTPUT_ENABLE0 | 1     | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE1 | 1     | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE2 | 1     | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE3 | 1     | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE4 | 1     | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE5 | 1     | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE6 | 1     | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE7 | 1     | Global control input to enable/disable VREF generation if required |
| VREF_OUTPUT_ENABLE8 | 1     | Global control input to enable/disable VREF generation if required |
| VREF_VALUE0         | 6:0   | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE1         | 6:0   | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE2         | 6:0   | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE3         | 6:0   | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE4         | 6:0   | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE5         | 6:0   | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE6         | 6:0   | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE7         | 6:0   | Vref value set for each byte lane - width can be customized        |
| VREF_VALUE8         | 6:0   | Vref value set for each byte lane - width can be customized        |
| CA_OUT_CLK0         | 1     | DRAM clock output from PHY                                         |
| CA_OUT_CLK1         | 1     | DRAM clock output from PHY                                         |
| CA_OUT_RST_N        | 1     | DRAM reset output from PHY                                         |
| CA_OUT_A0           | 1     | DRAM MA output from PHY                                            |

**Table 145: Output Ports (Continued)**

| <b>Name</b>                         | <b>Range</b> | <b>Description</b>                                                                           |
|-------------------------------------|--------------|----------------------------------------------------------------------------------------------|
| CA_OUT_A1                           | 1            | DRAM MA output from PHY                                                                      |

**Table 149: Parameters (Continued)**

| Attribute     | Values                                     | Description                                                  |
|---------------|--------------------------------------------|--------------------------------------------------------------|
| EDGE_MONITOR  | "DISABLED" ( <i>default</i> )<br>"ENABLED" | Enables edge monitor when in IDDR X2, X7to1, X4, or X5 mode. |
| WAIT_FOR_EDGE | "DISABLED" ( <i>default</i> )<br>"ENABLED" | Used for SPI4.2 implementation.                              |

This primitive can be used to delay the input data from the input pin to the IDDR, IREG, or FPGA OR to delay the output data from the ODDR, OREG, or FPGA fabric to the output pin. DELAYA is useful to adjust for any skews amongst the input or output data buses. DELAYA can also be used to generate skew between the bits of an output bus to reduce SSO noise.

DELAYA can be used with IDDR, ODDR, or SDR modules, as well as on the direct input to the FPGA. DELAYA is shared by the input and output paths, and so it can only be used to delay the input data or the output data on a given pin.

The data input to this primitive can be delayed using:

- ▶ Pre-determined delay value (for Zero Hold time, delay based on Interface Type)
- ▶ Fixed Delay values entered by user

The delay can also be dynamically updated using counter up and down controls.

You can optionally bypass DELAYA completely as well.

By default, DELAYA is configured to factory delay settings based on the clocking structure. You can overwrite the DELAYA setting using the MOVE and DIRECTION control inputs. The LOADN pin will reset the delay back to the default value.

## DELAYB

Static Input/Output Delay Element.

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL

- ▶ UT24C
- ▶ UT24CP

This primitive can be used to delay the input data from the input pin to the IDDR, IREG, or FPGA OR to delay the output data from the ODDR, OREG, or FPGA fabric to the output pin. DELAYB is useful to adjust for any skews

amongst the input or output data buses. DELAYB can also be used to generate skew between the bits of an output bus to reduce SSO noise.

DELAYB can be used with IDDR, ODDR, or SDR modules, as well as on the direct input to the FPGA. DELAYB is shared by the input and output paths, and so it can only be used to delay the input data or the output data on a given pin.

The data input to this primitive can be delayed using:

- ▶ Predetermined delay value (for Zero Hold time, delay based on Interface Type)
- ▶ Fixed Delay values entered by user

The delay can also be dynamically updated using counter up and down controls.

You can optionally bypass DELAYB completely as well.

By default, DELAYB is configured to factory delay settings based on the clocking structure. You cannot change the delay when using this module.

## DELAYC

Supports edge monitor feature

Architectures supported:

- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C

**Table 153: Input Ports**

| Name        | Description                                                                                                          |
|-------------|----------------------------------------------------------------------------------------------------------------------|
| A           | Data input from pin or output register block '0' on LOADN will reset to default delay setting                        |
| LOAD_N      | '0' on LOADN will reset to default delay setting                                                                     |
| MOVE        | "Pulse" on MOVE will change delay setting. DIRECTION will be sampled at falling edge of MOVE.                        |
| DIRECTION   | '1' to decrease delay and '0' to increase delay                                                                      |
| COARSE[1:0] | Dynamic coarse delay control (2 bits)<br>00: no coarse delay<br>01: 800 ps delay<br>10: 1600 ps delay<br>11: invalid |
| RANKSELECT  | Select which rank<br>0 - Select delay rank 0<br>1 - Select delay rank 1                                              |
| RANKENABLE  | Enable rank register<br>0 - Select bypassed actual path delay code<br>1 - Select registered actual path delay code   |
| RANK0UPADTE | Enable RANK0 register<br>0 - Rank-0 registers not enabled<br>1 - Enable Rank-0 registers                             |

**Table 153: Input Ports (Continued)**

| Name        | Description                                                                              |
|-------------|------------------------------------------------------------------------------------------|
| RANK1UPADTE | Enable RANK1 register<br>0 - Rank-1 registers not enabled<br>1 - Enable Rank-1 registers |
| ECLK        | Fast edge clock                                                                          |
| SCLK        | Primary clock input (divide-by-2 of ECLK)                                                |

**Table 154: Output Ports**

| Name    | Description                                                                                            |
|---------|--------------------------------------------------------------------------------------------------------|
| Z       | Delayed data to input register block or to pin                                                         |
| EDETERR | Error detected when using the edge monitor logic                                                       |
| CFLAG   | Flag indicating the delay counter has reached the max (when moving up) or min (when moving down) value |

**Table 155: Parameters**

| Attribute         | Values                                                                                                                                                                                                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                       |

| GSR           | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable global set/reset.                                     |

## DELAYD

Input or output delay for SCLK interface with dynamically control delay.

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 156: Input Ports**

| Name      | Range | Type    | Active State | Description                                                                   |
|-----------|-------|---------|--------------|-------------------------------------------------------------------------------|
| A         | 1     | Data    | High         | Data input from pin                                                           |
| LOAD      | 1     | Control | High         | LOAD is set to 1 to reset to delay setting (DEL_VALUE)                        |
| MOVE      | 1     | Control | High         | MOVE will change delay setting. DIR will be sampled at "falling edge" of MOVE |
| DIRECTION | 1     | Control | High         | DIRECTION<br>1 to decrease delay<br>0 to increase delay                       |

**Table 156: (Continued)Input Ports**

| Name  | Range | Type | Active State | Description            |
|-------|-------|------|--------------|------------------------|
| CODE8 | 1     | Data | High         | Delay Code from DDRDLL |
| CODE7 | 1     | Data | High         | Delay Code from DDRDLL |
| CODE6 | 1     | Data | High         | Delay Code from DDRDLL |
| CODE5 | 1     | Data | High         | Delay Code from DDRDLL |
| CODE4 | 1     | Data | High         | Delay Code from DDRDLL |
| CODE3 | 1     | Data | High         | Delay Code from DDRDLL |
| CODE2 | 1     | Data | High         | Delay Code from DDRDLL |
| CODE1 | 1     | Data | High         | Delay Code from DDRDLL |
| CODE0 | 1     | Data | High         | Delay Code from DDRDLL |

**Table 157: Output Ports**

| Name  | Range | Type | Active State | Description                                                                                        |
|-------|-------|------|--------------|----------------------------------------------------------------------------------------------------|
| Z     | 1     | Flag | High         | Delay Output                                                                                       |
| CFLAG | 1     | Flag | High         | Flag indicating the delay counter has reached max (when moving up) or min (when moving down) value |

**Table 158: Parameters**

| Name       | Values                                                         | Description               |
|------------|----------------------------------------------------------------|---------------------------|

| DEL_VALUE  | "0" to "511"                                                   | Static Delay Value        |
| DEL_SOURCE | "DEL_VALUE"<br>"DDRDLL"                                        | Static Delay Value Source |

## DELAYE

Input delay or output delay for SCLK interface with static delay.

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 159: Input Ports**

| Name | Range | Type | Active State | Description         |
|------|-------|------|--------------|---------------------|
| A    | 1     | Data | High         | Data input from pin |

**Table 160: Output Ports**

| Name | Range | Type | Active State | Description  |
|------|-------|------|--------------|--------------|
| Z    | 1     | Flag | High         | Delay Output |

**Table 161: Parameters**

| Name      | Values                                                         | Description        |
|-----------|----------------------------------------------------------------|--------------------|
| DEL_MODE  | USER_DEFINED<br>SCLK_ZEROHOLD<br>SCLK_ALIGNED<br>SCLK_CENTERED | Set delay mode     |
| DEL_VALUE | "0" to "511"                                                   | Static Delay Value |

## DELAYF

Input or output delay for ECLK interface with dynamically control delay

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 162: Input Ports**

| Name      | Range | Type    | Active State | Description                                                                   |
|-----------|-------|---------|--------------|-------------------------------------------------------------------------------|
| A         | 1     | Data    | High         | Data input from pin                                                           |
| LOAD      | 1     | Control | High         | LOAD is set to 0 to reset to delay setting (DEL_VALUE)                        |
| MOVE      | 1     | Control | High         | MOVE will change delay setting. DIR will be sampled at "falling edge" of MOVE |
| DIRECTION | 1     | Control | High         | DIRECTION<br>1 to decrease delay<br>0 to increase delay                       |
| CODE8     | 1     | Data    | High         | Delay Code from DDRDLL                                                        |
| CODE7     | 1     | Data    | High         | Delay Code from DDRDLL                                                        |
| CODE6     | 1     | Data    | High         | Delay Code from DDRDLL                                                        |
| CODE5     | 1     | Data    | High         | Delay Code from DDRDLL                                                        |
| CODE4     | 1     | Data    | High         | Delay Code from DDRDLL                                                        |
| CODE3     | 1     | Data    | High         | Delay Code from DDRDLL                                                        |
| CODE2     | 1     | Data    | High         | Delay Code from DDRDLL                                                        |
| CODE1     | 1     | Data    | High         | Delay Code from DDRDLL                                                        |
| CODE0     | 1     | Data    | High         | Delay Code from DDRDLL                                                        |

**Table 163: Output Ports**

| Name  | Range | Type | Action State | Description                                                                                        |
|-------|-------|------|--------------|----------------------------------------------------------------------------------------------------|

## DELAYG

Dynamic Delay for Bottom Bank

Architectures Supported:

▶ LFMXO4

**Table 165: Input Ports**

| Name | Range | Description                   |
|------|-------|-------------------------------|
| A    | 1     | Data Input A                  |
| DEL  | 4:0   | Dynamic delay inputs from CIB |

**Table 166: Output Ports**

| Name | Range | Description       |
|------|-------|-------------------|
| Z    | 1     | Output with delay |

**Description**

DELAYG is the dynamic delay for VPIC\_RX, IOLA and IOLC cells in bottom side only. It can be used for x2, x4 and 7:1 applications. Refer to the following technical note for more details:

**DELAYH****Fixed Delay in PIO**

Architectures Supported:

▶ LFMXO4

**Table 167: Input Ports**

| Name | Range | Description |
|------|-------|-------------|
| A    | 1     | Data input  |

**Table 168: Output Ports**

| Name | Range | Description |
|------|-------|-------------|
| Z    | 1     | Data output |

**Table 169: Parameters**

| Name      | Values                                                                                                                        | Description        |
|-----------|-------------------------------------------------------------------------------------------------------------------------------|--------------------|
| DEL_MODE  | "SCLK_ZEROHOLD",<br>"ECLK_ALIGNED",<br>"ECLK_CENTERED",<br>"SCLK_ALIGNED",<br>"SCLK_CENTERED",<br>"USER_DEFINED"<br>(default) | Set delay mode     |
| DEL_VALUE | "DELAY0" (default),<br>"DELAY1", "DELAY2", ...,<br>"DELAY31"                                                                  | Static Delay Value |

**Description**

DELAYH is the fix delay in PIO for all banks and all sides. It can be used for all IO registers and DDR types.

**DIFFCLKIO**

Differential to single-end clock buffer.

Architectures supported:

- ▶ LFCPNX
- ▶ LFMXO5T
- ▶ LFMXO5TD
- ▶ UT24CP

**Table 170: Input Ports**

| Name     | Description                    |
|----------|--------------------------------|
| CLKIN0_P | 1st diff reference clock input |
| CLKIN0_N | 1st diff reference clock input |
| CLKIN1_P | 2nd diff reference clock input |
| CLKIN1_N | 2nd diff reference clock input |

**Table 171: Output Ports**

| Name    | Description                 |
|---------|-----------------------------|
| CLKOUT0 | 1st single end clock output |
| CLKOUT1 | 2nd single end clock output |

**Table 172: Parameters**

| Name      | Values                            | Description                               |
|-----------|-----------------------------------|-------------------------------------------|
| TERM_RD   | "ENABLED" (default)<br>"DISABLED" | Differential termination resistor control |
| WEAK_BIAS | "DISABLED" (default)<br>"ENABLED" | Internal weak bias enable control         |

## DIFFIO18

Single Ended + Differential I/O block for 1.8V block

Architectures supported:

- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5D
- ▶ LFMXO5-25
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C

**Table 173: Input Ports**

| Name   | Description                              |
|--------|------------------------------------------|
| PADD0  | Data output from fabric to IO pad        |
| DOLP   | Data output for MIPI low-power mode      |
| PADDT  | Data tri-state control; high = tri-state |
| HSRXEN | RX enable for MIPI high-speed mode       |
| HSTXEN | TX enable for MIPI high-speed mode       |

**Table 174: Output Ports**

| Name  | Description                        |
|-------|------------------------------------|
| PADDI | Data input from IO pad to fabric   |
| INLP  | Data input for MIPI low-power mode |
| INADC | Output to ADC                      |

**Table 175: Bidirectional Ports**

| Name  | Description       |
|-------|-------------------|
| IOPAD | IO Pad connection |

**Table 176: Parameters**

| Name     | Values                                                       | Description                      |
|----------|--------------------------------------------------------------|----------------------------------|
| PULLMODE | "DOWN" (default)<br>"NONE"<br>"UP"<br>"KEEPER"<br>"FAILSAFE" | Enables pullup and pulldown mode |
| ENADC_IN | "DISABLED" (default)<br>"ENABLED"                            | Enables pad A path to adc block  |
| MIPI     | "DISABLED" (default)<br>"ENABLED"                            | Enable MIPI_DPHY IO TYPE         |

## DIFFIO18A

Single Ended + Differential I/O block for 1.8V block

Architectures supported:

- ▶ LFCPNX
- ▶ LFMXO5T
- ▶ LFMXO5TD
- ▶ UT24CP

**Table 177: Input Ports**

| Name     | Description                                                                                                                                                                                                                                                                                                                                          |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PADD0    | HS Data out to PAD                                                                                                                                                                                                                                                                                                                                   |
| DOLP     | LP Data out to PAD                                                                                                                                                                                                                                                                                                                                   |
| PADDT    | Tri-state input signals to IO A,<br>0: driver output enabled<br>1: diver enabled to tri-state(high-Z) output                                                                                                                                                                                                                                         |
| HSRXEN   | Enable signal for HSRX termination ibuf_rd:0 disable; 1 enable                                                                                                                                                                                                                                                                                       |
| HSTXEN   | Enable signal for HSTX termination                                                                                                                                                                                                                                                                                                                   |
| IVREF_IN | Internal Receiver Reference Voltage Input. Each bank will support 3 VREF analog input voltages for flexibility to receive three different referenced input levels on the same bank. VREFs are used to set the threshold for the referenced input receiver. Each referenced receiver has a programmable option to select VREF1/2 and a internal VREF. |

**Table 178: Output Ports**

| Name  | Description                           |
|-------|---------------------------------------|
| PADDI | Data in                               |
| INLP  | MIPI LP RX output                     |
| INADC | Output to ADC through switch from PAD |

**Table 179: Bidirectional Ports**

| Name  | Description                                             |
|-------|---------------------------------------------------------|
| IOPAD | A virtual port, which is connected to the external pad. |

**Table 180: Parameters**

| Name     | Values                             | Description                     |
|----------|------------------------------------|---------------------------------|
| PULLMODE | "DOWN" (default)<br>"NONE"<br>"UP" | Pull mode                       |
| ENADC_IN | "DISABLED" (default)<br>"ENABLED"  | Enables pad A path to adc block |
| MIPI     | "DISABLED" (default)<br>"ENABLED"  | MIPI usage                      |

## DLLDEL

Slave delay elements are used to support generic DDR RX modes to shift input clock phase by 90 degrees.

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T

- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 181: Input Ports**

| Name      | Description                                                                                  |
|-----------|----------------------------------------------------------------------------------------------|
| CLKIN     | Input clock                                                                                  |
| CODE[8:0] | Code control                                                                                 |
| DIR       | Direction                                                                                    |
| LOAD_N    | '0' on LOADN will reset to default delay setting                                             |
| MOVE      | "Pulse" on MOVE will change delay setting. DIRECTION will be sampled at falling edge of MOVE |

**Table 182: Output Ports**

| Name   | Description            |
|--------|------------------------|
| CLKOUT | Output clock to fabric |
| COUT   | Carry out              |

**Table 183: Parameters**

| Name   | Values      | Description                                                                                                                                                                                                                                                  |
|--------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADJUST | 0 (default) | Offset for slave delay adjustment. mc1_adjust[9] is the sign bit.<br><br>Examples:<br>mc1_adjust[9:0] = 0_000000000: adds 0 units of delay<br>mc1_adjust[9:0] = 0_000000010: adds 2 units of delay<br>mc1_adjust[9:0] = 0_111111111: adds 511 units of delay |

**Table 183: Parameters (Continued)**

| Name       | Values                            | Description                                                                                                                                                                   |
|------------|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DEL_ADJUST | "PLUS" (default)<br>"MINUS"       | Sign bit for mc1_adjust, bit [9].<br>The DEL_ADJUST and ADJUST are set to a value based on device performance. MAP will use fixed values for these components during the MAP. |
| ENABLE     | "ENABLED" (default)<br>"DISABLED" | Enables the block and ties off the clk output when not using this block.                                                                                                      |

## DLLDELA

DDR RX modes to shift input clock phase by 90 degrees

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 184: Input Ports**

| Name      | Range | Type    | Active State | Description                                                                  |
|-----------|-------|---------|--------------|------------------------------------------------------------------------------|
| A         | 1     | Data    | High         | Data input from pin                                                          |
| LOAD      | 1     | Control | High         | LOAD is set to 1 to reset to default delay setting                           |
| MOVE      | 1     | Control | High         | MOVE will change delay setting. DIR will be sampled at "rising edge" of MOVE |
| DIRECTION | 1     | Control | High         | DIRECTION<br>1 to decrease delay<br>0 to increase delay                      |
| CODE      | 9     | Control | High         | Delay code from DDRDLL                                                       |

**Table 185: Output Ports**

| Name  | Range | Type | Active State | Description                                                                                        |
|-------|-------|------|--------------|----------------------------------------------------------------------------------------------------|
| Z     | 1     | Data | High         | Delayed data to input register block                                                               |
| CFLAG | 1     | Flag | High         | Flag indicating the delay counter has reached max (when moving up) or min (when moving down) value |

**Table 186: Parameters**

| Name      | Values                  | Description                                                                                                                                                            |
|-----------|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DEL_ADJ   | "PLUS"<br>"MINUS"       | DLL control code forcing.<br>"DLL_LOOP": Code/lock generated from DLL loop<br>"FORCE_MAX": Force lock and code is set to maximum of 511 for lower input frequency mode |
| DEL_VALUE | "0" to "511"            | Offset for slave delay adjustment                                                                                                                                      |
| GSR       | "ENABLED"<br>"DISABLED" | Enable or disable GSR feature                                                                                                                                          |

## DLLDELC

Clock Shifting for ECLK or PCLK

Architectures Supported:

- ▶ LFMXO4

**Table 187: Input Ports**

| Name   | Range | Description                       |
|--------|-------|-----------------------------------|
| CLKI   | 1     | clk input from I/O buffer         |
| DQSDEL | 1     | Dynamic delay inputs from DQSDLLC |

**Table 188: Output Ports**

| Name | Range | Description             |
|------|-------|-------------------------|
| CLKO | 1     | Clock output with delay |

**Table 189: Parameters**

| Name    | Values           | Description                                                           |
|---------|------------------|-----------------------------------------------------------------------|
| DEL_ADJ | "PLUS" (default) | DEL_ADJUST and ADJUST are set to a value based on device performance. |
| DEL_VAL | "0"              | Static Delay Value                                                    |

**Description**

DLLDELC is the generic input clock shifting using DQSDEL from DQSDLL. For more details such as application examples, refer to the related technical notes on the Lattice web site.

**DOTPRODADDSUB9X9**

Four 9x9 Multiplier with Optional Input/output registers and adder/subtractor

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 190: Input Ports**

| Name      | Range | Type         | Active State | Description                               |
|-----------|-------|--------------|--------------|-------------------------------------------|
| A0        | 8:0   | Data         | Active high  | Operand A0                                |
| B0        | 8:0   | Data         | Active high  | Operand B0                                |
| A1        | 8:0   | Data         | Active high  | Operand A1                                |
| B1        | 8:0   | Data         | Active high  | Operand B1                                |
| A2        | 8:0   | Data         | Active high  | Operand A2                                |
| B2        | 8:0   | Data         | Active high  | Operand B2                                |
| A3        | 8:0   | Data         | Active high  | Operand A3                                |
| B3        | 8:0   | Data         | Active high  | Operand B3                                |
| CLK       | 1     | Clock        | Active high  | Clock                                     |
| RST       | 1     | Reset        | Active high  | Synchronous reset for all registers       |
| CEA1      | 1     | Clock Enable | Active high  | Input A register clock enable, stage one  |
| CEA2      | 1     | Clock Enable | Active high  | Input A register clock enable, stage two  |
| CEB1      | 1     | Clock Enable | Active high  | Input B register clock enable, stage one  |
| CEB2      | 1     | Clock Enable | Active high  | Input B register clock enable, stage two  |
| CEOUTPIPE | 1     | Clock Enable | Active high  | Pipeline and output register clock enable |
| ASHIFTIN  | 8:0   | Data         | Active high  | Operand A shift chain input               |
| BSHIFTIN  | 8:0   | Data         | Active high  | Operand B shift chain input               |
| CIN       | 1     | Control      | Active high  | Carry in                                  |

**Table 190: Input Ports (Continued)**

| Name         | Range | Type    | Active State | Description                                                                 |
|--------------|-------|---------|--------------|-----------------------------------------------------------------------------|
| CAS_ZIN      | 47:0  | Control | Active low   | Cascade input                                                               |
| CAS_CIN      | 1     | Control | Active low   | Cascade carry in                                                            |
| SELC_N       | 1     | Control | Active high  | Select between C or accumulator output for input to the accumulator         |
| SELCAS_ZIN_N | 1     | Control | Active low   | Select between CAS_ZIN or accumulator output for input to the accumulator   |
| SELCARRY     | 1     | Control | Active high  | Select between CIN or accumulator output Z[47] for input to the accumulator |
| ADDSUBACCUM  | 1     | Control | Active high  | Add/sub control for accumulator, 0=add, 1=subtract                          |

**Table 191: Output Ports**

| Name      | Range | Type    | Active State | Description                                      |
|-----------|-------|---------|--------------|--------------------------------------------------|
| ASHIFTOUT | 8:0   | Control | Active high  | Operand A shift chain output                     |
| BSHIFTOUT | 8:0   | Control | Active high  | Operand B shift chain output                     |
| ZOUT      | 47:0  | Control | Active high  | Multiplication/accumulator output result         |
| COUT      | 1     | Control | Active high  | Carry out                                        |
| OVERFLOW  | 1     | Flag    | Active high  | Overflow flag                                    |
| CAS_ZOUT  | 47:0  | Control | Active low   | Cascade multiplication/accumulator output result |
| CAS_COUT  | 1     | Control | Active low   | Cascade carry out                                |

**Table 192: Parameters**

| Name       | Values                                                          | Description         |

| SATURATION      | "DISABLED" (default)<br>"TO_NEG_MAX"<br>"TO_ZERO" | Saturation enable                                                         |
| SATURATION_BITS | "48" (default)<br>"3-48"                          | Saturation bits                                                           |
| GSR             | "DISABLED" (default)<br>"ENABLED"                 | Enable global set/reset                                                   |

When the accumulator is enabled, it implements the function:

$$M\_INT = (A\_0 * B\_0 + (A\_1 * B\_1) + (A\_2 * B\_2) + (A\_3 * B\_3)$$

$$Z\_out = CAS\_INT + C\_INT + CIN\_INT +/- M\_INT$$

When the accumulator is disabled, it implements the function:

$$Z\_OUT = (A\_0 * B\_0) + (A\_1 * B\_1) + (A\_2 * B\_2) + (A\_3 * B\_3)$$

See the first diagram for the internal node corresponding to the above terms.

Although not shown in the above diagram, the register for accumulator inputs CIN, CAS\_ZIN\_EN, SELCAS\_ZIN, and ADDSUBACCUM is bypassable with the parameter REGACCUMCONTROLS.

## **DOTPRODADDSUB9X9A**

Four 9x9 Multiplier with Optional Input/output registers and adder/subtractor

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 193: Input Ports**

| Name      | Range | Type         | Active State | Description                                                         |
|-----------|-------|--------------|--------------|---------------------------------------------------------------------|
| A0        | 8:0   | Data         | Active high  | Operand A0                                                          |
| B0        | 8:0   | Data         | Active high  | Operand B0                                                          |
| CLK       | 1     | Clock        | Active high  | Clock                                                               |
| RST       | 1     | Reset        | Active high  | Synchronous reset for all registers                                 |
| CEA1      | 1     | Clock Enable | Active high  | Input A register clock enable, stage one                            |

| REGACCUMCONTROLS | "REGISTERED" (default)<br>"BYPASSED"                            | Register accumulator controls (CIN, SELCARRY, SELCAS_ZIN, ADDSUBACCUM, SELC) |
| RESETMODE        | "SYNC" (default)<br>"ASYN"                                      | Synchronous/asynchronous reset control                                       |
| ACCUM_EN         | "DISABLED" (default)<br>"ENABLED"                               | Enable accumulator                                                           |
| ACCUM_C_EN       | "DISABLED" (default)<br>"ENABLED"                               | Enable dynamic C for accumulator input (1) or tie to constant 0 (0)          |
| CAS_ZIN_EN       | "DISABLED" (default)<br>"ENABLED"                               | Enable dynamic CAS_ZIN for accumulator input (1) or tie to constant 0 (0)    |
| CAS_CIN_EN       | "DISABLED" (default)<br>"ENABLED"                               | Use CAS_CIN for carry input                                                  |
| ROUNDMODE        | "ROUND_TO_ZERO" (default)<br>"ROUND_TO_INFINITY"                | Rounding mode                                                                |
| SATURATION       | "DISABLED" (default)<br>"TO_NEG_MAX"<br>"TO_ZERO"               | Saturation enable                                                            |

**Table 195: Parameters (Continued)**

| Name            | Values                            | Description             |
|-----------------|-----------------------------------|-------------------------|
| SATURATION_BITS | "48" (default)<br>"3-48"          | Saturation bits         |
| GSR             | "DISABLED" (default)<br>"ENABLED" | Enable global set/reset |

**Note:**

The function of "MULT9 group" in the above diagram is shown below.

When the accumulator is enabled, it implements the function:

$$M\_INT = (A\_0 * B\_0) + (A\_1 * B\_1) + (A\_2 * B\_2) + (A\_3 * B\_3)$$

$$Z\_out = CAS\_INT + C\_INT + CIN\_INT +/- M\_INT$$

When the accumulator is disabled, it implements the function:

$$Z\_out = (A\_0 * B\_0) + (A\_1 * B\_1) + (A\_2 * B\_2) + (A\_3 * B\_3)$$

See the first diagram for the internal node corresponding to the above terms.

Although not shown in the above diagram, the register for accumulator inputs CIN, CAS\_ZIN\_EN, SELCAS\_ZIN, and ADDSUBACCUM is bypassable with the parameter REGACCUMCONTROLS.

## DP32K

32 Kb Dual Port Block RAM

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 199: Input Ports**

| Name | Range | Type         | Active State | Description                                |
|------|-------|--------------|--------------|--------------------------------------------|
| DIA  | 35:0  | Data         | Active High  | A-port Data Inputs                         |
| DIB  | 35:0  | Data         | Active High  | B-port Data Inputs                         |
| ADA  | 14:0  | Addr         | Active High  | A-port Address                             |
| ADB  | 14:0  | Addr         | Active High  | B-port Address                             |
| CLKA | 1     | Clock        | Rising Edge  | A-port Clock Input                         |
| CLKB | 1     | Clock        | Rising Edge  | B-port Clock Input                         |
| CEA  | 1     | Clock Enable | Active High  | A-port Clock Enable                        |
| CEB  | 1     | Clock Enable | Active High  | B-port Clock Enable                        |
| OCEA | 1     | Control      | Active High  | A-port Output Clock Register Enable        |
| OCEB | 1     | Control      | Active High  | B-port Output Clock Register Enable        |
| WEA  | 1     | Control      | Active High  | A-port Write Enable<br>1: Write<br>0: Read |
| WEB  | 1     | Control      | Active High  | B-port Write Enable<br>1: Write<br>0: Read |
| CSA  | 2:0   | Control      | Active High  | A-port Cascade Select                      |
| CSB  | 2:0   | Control      | Active High  | B-port Cascade Select                      |
| RSTA | 1     | Reset        | Active High  | A-port output registers reset              |
| RSTB | 1     | Reset        | Active High  | B-port output registers reset              |

**Table 200: Output Ports**

| Name | Range | Type | Active State | Description        |
|------|-------|------|--------------|--------------------|
| DOA  | 35:0  | Data | Active High  | A-port Data Output |
| DOB  | 35:0  | Data | Active High  | B-port Data Output |

**Table 201: Parameters**

| Name         | Values                                                                         | Description                                      |
|--------------|--------------------------------------------------------------------------------|--------------------------------------------------|
| DATA_WIDTH_A | "X36"(default)<br>"X18"<br>"X9"<br>"X4"<br>"X2"<br>"X1"                        | Port A data width                                |
| DATA_WIDTH_B | "X36"(default)<br>"X18"<br>"X9"<br>"X4"<br>"X2"<br>"X1"                        | Port B data width                                |
| OUTREG_A     | "BYPASSED" (default)<br>"USED"                                                 | Register port A output                           |
| OUTREG_B     | "BYPASSED" (default)<br>"USED"                                                 | Register port B output                           |
| GSR          | "ENABLED" (default)<br>"DISABLED"                                              | Enable global set/reset for the output registers |
| RESETMODE_A  | "SYNC" (default)<br>"ASYNC"                                                    | Port A sync/async reset control                  |
| RESETMODE_B  | "SYNC" (default)<br>"ASYNC"                                                    | Port B sync/async reset control                  |
| CSDECODE_A   | "000" (default)<br>"001"<br>"010"<br>"011"<br>"100"<br>"101"<br>"110"<br>"111" | Port A chip select active setting                |

**Table 201: Parameters (Continued)**

|                         |                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 202: Input Ports**

| Name | Range | Description                    |
|------|-------|--------------------------------|
| CEA  | 1     | Clock enable for port CLKA     |
| OCEA | 1     | Output clock enable for port A |
| CLKA | 1     | Clock for port A               |
| WEA  | 1     | Write enable for port A        |
| RSTA | 1     | Reset for port A               |
| CEB  | 1     | Positive clock enable          |
| OCEB | 1     | Output clock enable for port B |
| CLKB | 1     | Clock for port B               |
| WEB  | 1     | Write enable for port B        |
| RSTB | 1     | Reset for port B               |
| CSA  | 2:0   | Chip select for port A         |
| DIA  | 8:0]  | Input data port A (up to 9)    |
| DIB  | 8:0]  | Input data port B (up to 9)    |
| CSB  | 2:0   | Chip select for port B         |
| ADB  | 12:0  | Address bus port B (up to 13)  |
| ADA  | 12:0  | Address bus port A (up to 13)  |

**Table 203: Output Ports**

| Name | Range | Description                  |
|------|-------|------------------------------|
| DOB  | 8:0   | Output data port B (up to 9) |
| DOA  | 8:0   | Output data port A (up to 9) |

**Table 205: Input Ports**

| <b>Name</b> | <b>Range</b> | <b>Description</b> |
|-------------|--------------|--------------------|
| DI3         | 1            | Write data         |
| DI2         | 1            | Write data         |
| DI1         | 1            | Write data         |
| DI0         | 1            | Write data         |
| WAD3        | 1            | Write address      |
| WAD2        | 1            | Write address      |
| WAD1        | 1            | Write address      |
| WAD0        | 1            | Write address      |
| WCK         | 1            | Write clock        |
| WRE         |              | Write enable       |
| RAD3        |              | Read address       |
| RAD2        |              | Read address       |
| RAD1        |              | Read address       |
| RAD0        |              | Read address       |

**Table 206: Output Ports**

| <b>Name</b> | <b>Range</b> | <b>Description</b> |
|-------------|--------------|--------------------|
| DO3         | 1            | Read data          |
| DO2         | 1            | Read data          |
| DO1         | 1            | Read data          |
| DO0         | 1            | Read data          |

**Table 207: Parameters**

| <b>Name</b> | <b>Values</b>        | <b>Description</b>       |
|-------------|----------------------|--------------------------|
| INITVAL     | "0x0000000000000000" | RAM initialization value |

## DPHY

The MIPI wrapper IP is used for MIPI DPHY v1.2: 4 channels DPHY with VCC= 0.9V/1.0V

### Warning

---

You should not try to use this primitive directly. Instead, use the related IP in IP Catalog. The following information is for reference only.

---

Architectures supported:

▶ LIFCL-40, LIFCL-17

| DP3  | 1     | Data Lane 3 Negative |

**Table 211: Parameters**

| Name          | Values                                                               | Description                                                                                                                                             |
|---------------|----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| GSR           | "ENABLED" (default)<br>"DISABLED"                                    | Enable or disable GSR feature                                                                                                                           |
| AUTO_PD_EN    | "POWERED_UP" (default)<br>"POWERED_DOWN"                             | Powers down inactive lanes reported by CFG_NUM_LANES input bus                                                                                          |
| CFG_NUM_LANES | "ONE_LANE" (default)<br>"TWO_LANES"<br>"THREE_LANES"<br>"FOUR_LANES" | Sets the number of active lanes                                                                                                                         |
| CM            | 0'b00000000 (default)                                                | PLL dividers should be set to produce the required high speed BITCLK to be used for testing                                                             |
| CN            | 0'b00000 (default)                                                   | PLL dividers should be set to produce the required high speed BITCLK to be used for testing                                                             |
| CO            | 0'b000 (default)                                                     | PLL dividers should be set to produce the required high speed BITCLK to be used for testing                                                             |
| CONT_CLK_MODE | "DISABLED" (default)<br>"ENABLED"                                    | This static input pin enables the slave clock lane feature to maintain HS reception state during continuous clock mode operation, despite line glitches |
| DESKEW_EN     | "DISABLED" (default)<br>"ENABLED"                                    | Enables Deskew feature that modifies ERRSYNC/NOSYNC behavior                                                                                            |
| DSI_CSI       | "CSI2_APP" (default)<br>"DSI_APP"                                    | Selects the PHY IP Application                                                                                                                          |
| EN_CIL        | "CIL_ENABLED" (default)<br>"CIL_BYPASSED"                            | This signal should start with 1b1 then move to 1b0 to reset internal registers when in CIL Bypass mode                                                  |
| HSEL          | "DISABLED" (default)<br>"ENABLED"                                    | High Speed Select                                                                                                                                       |
| LANE0_SEL     | "LANE_0" (default)<br>"LANE_1"<br>"LANE_2"<br>"LANE_3"               | This input determines which lane will act as data lane0 in HS Operation mode                                                                            |
| LOCK_BYP      | "GATE_TXBYTECLKHS" (default)<br>"NOT_GATE_TXBYTECLKHS"               | When clock lane exits from ULPS, this input determines if the PLL LOCK signal will be used to gate the TxByteClkHS                                      |
| MASTER_SLAVE  | "SLAVE" (default)<br>"MASTER"                                        | Should be set to 1 for HS-TX and LP-TX Tests and set to 0 for remaining tests                                                                           |
| PLLCLKBYPASS  | "REGISTERED" (default)<br>"BYPASSED"                                 | PLL Clock bypass                                                                                                                                        |
| RSEL          | 0'b00 (default)                                                      | Receiver Select                                                                                                                                         |

| Name               | Values                                     | Description                                                                                                   |
|--------------------|--------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| RXCDRP             | 0'b00 (default)                            | On-chip termination control bits for manual calibration of HS-RX                                              |
| RXDATAWIDTHHS      | 0'b00 (default)                            | One-time programming bits that adjust the threshold voltage of LP-CD default setting 2b01                     |
| RXLPRP             | 0'b000 (default)                           | High-Speed Receive Data Width Select                                                                          |
| TEST_ENBL          | 0'b0000000 (default)                       | Enable TEST_PATTERN                                                                                           |
| TEST_PATTERN       | 0'b000000000000000000000000 (default)      | 32-bit BIST pattern to check loopback.                                                                        |
| TST                | 0'b1001 (default)<br>0000                  | PLL charge pump current control                                                                               |
| TXDATAWIDTHHS      | 0'b00 (default)                            | High-Speed Transmit Data Width Select                                                                         |
| U_PRG_HS_PREPARE   | 0'b00 (default)                            | Bits used to program T_HS_PREPARE time in the beginning of high speed transmission mode                       |
| U_PRG_HS_TRAIL     | 0'b000000 (default)                        | Bits used to program T_HS_TRAIL time in the end of high speed transmission mode                               |
| U_PRG_HS_ZERO      | 0'b000000 (default)                        | Bits used to program T_HS_ZERO time in the beginning of high speed transmission mode                          |
| U_PRG_RXHS_SETTLE  | 0'b000000 (default)                        | Bits used to program T_HS_SETTLE. HS-RX waits for Time-out T_HS_SETTLE in order to neglect transition effects |
| UC_PRG_HS_PREPARE  | "1P0_TXCLKESC" (default)<br>"1P5_TXCLKESC" | High-Speed Prepare Time                                                                                       |
| UC_PRG_HS_TRAIL    | 0'b00000 (default)                         | High-Speed Zero Time                                                                                          |
| UC_PRG_HS_ZERO     | 0'b0000000 (default)                       | High-Speed Trail Time                                                                                         |
| UC_PRG_RXHS_SETTLE | 0'b000000 (default)                        | Receiver High-Speed Settle Time                                                                               |

**Table 212: Input Ports**

| Name     | Description   |
|----------|---------------|
| DI[3:0]  | Data in       |
| WAD[3:0] | Write address |
| WCK      | Write clock   |
| WRE      | Write enable  |
| RAD[3:0] | Read address  |

**Table 213: Output Ports**

| Name    | Description |
|---------|-------------|
| DO[3:0] | Data out    |

**Table 214: Parameters**

| Name    | Values                                  | Description                        |
|---------|-----------------------------------------|------------------------------------|
| INITVAL | "0x0000000000000000" ( <i>default</i> ) | 16-digit hex string, 64 bits total |

**Table 215: INIT Setting**

| Address   | Bit Index 3 | Bit Index 2 | Bit Index 1 | Bit Index 0 |
|-----------|-------------|-------------|-------------|-------------|
| Address 0 | INIT[48]    | INIT[32]    | INIT[16]    | INIT[0]     |
| Address 1 | INIT[49]    | INIT[33]    | INIT[17]    | INIT[1]     |
| Address 2 | INIT[50]    | INIT[34]    | INIT[18]    | INIT[2]     |
| Address 3 | INIT[51]    | INIT[35]    | INIT[19]    | INIT[3]     |
| Address 4 | INIT[52]    | INIT[36]    | INIT[20]    | INIT[4]     |
| Address 5 | INIT[53]    | INIT[37]    | INIT[21]    | INIT[5]     |

**Table 215: INIT Setting (Continued)**

| Address    | Bit Index 3 | Bit Index 2 | Bit Index 1 | Bit Index 0 |
|------------|-------------|-------------|-------------|-------------|
| Address 6  | INIT[54]    | INIT[38]    | INIT[22]    | INIT[6]     |
| Address 7  | INIT[55]    | INIT[39]    | INIT[23]    | INIT[7]     |
| Address 8  | INIT[56]    | INIT[40]    | INIT[24]    | INIT[8]     |
| Address 9  | INIT[57]    | INIT[41]    | INIT[25]    | INIT[9]     |
| Address 10 | INIT[58]    | INIT[42]    | INIT[26]    | INIT[10]    |
| Address 11 | INIT[59]    | INIT[43]    | INIT[27]    | INIT[11]    |
| Address 12 | INIT[60]    | INIT[44]    | INIT[28]    | INIT[12]    |
| Address 13 | INIT[60]    | INIT[45]    | INIT[29]    | INIT[13]    |
| Address 14 | INIT[62]    | INIT[46]    | INIT[30]    | INIT[14]    |
| Address 15 | INIT[63]    | INIT[47]    | INIT[31]    | INIT[15]    |

For the output to be Data = Address (Address 0 = Data 0 and so on), the INIT must be:

INIT = 0xFF00F0F0CCCCAAAA

LUT3.INIT = "FF00"

LUT2.INIT = "F0F0"

LUT1.INIT = "CCCC"

LUT0.INIT = "AAAA"

## DPR16X4A

Distributed Pseudo Dual Port RAM. Synchronous write, asynchronous read

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 216: Input Ports**

| Name | Range | Type    | Description   |
|------|-------|---------|---------------|
| RAD  | 3:0   | Addr    | Read address  |
| DI   | 3:0   | Data    | Write data    |
| WAD  | 3:0   | Addr    | Write address |
| WRE  | 1     | Control | Write enable  |
| WCK  | 1     | Clock   | Write clock   |

**Table 217: Output Ports**

| Name | Range | Type | Description |
|------|-------|------|-------------|
| DO   | 3:0   | Data | Read data   |

**Table 218: Parameters**

| Name    | Values                         | Description              |
|---------|--------------------------------|--------------------------|
| INITVAL | "0x0000000000000000" (default) | RAM initialization value |

## DPR32X2

Distributed Pseudo Dual Port RAM. Synchronous write, asynchronous read

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 219: Input Ports**

| Name | Range | Type    | Description   |
|------|-------|---------|---------------|
| RAD  | 4:0   | Addr    | Read address  |
| DI   | 1:0   | Data    | Write data    |
| WAD  | 4:0   | Addr    | Write address |
| WRE  | 1     | Control | Write enable  |
| WCK  | 1     | Clock   | Write clock   |

**Table 220: Output Ports**

| Name | Range | Type | Description |
|------|-------|------|-------------|
| DO   | 1:0   | Data | Read data   |

**Table 221: Parameters**

| Name    | Values                         | Description              |
|---------|--------------------------------|--------------------------|
| INITVAL | "0x0000000000000000" (default) | RAM initialization value |

## DPSC512K

512Kb Single Clock Dual Port Block RAM

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35

- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 222: Input Ports**

| Name      | Description                  |
|-----------|------------------------------|
| DIA[31:0] | Port A data in               |
| DIB[31:0] | Port B data in               |
| ADA[13:0] | Port A address               |
| ADB[13:0] | Port B address               |
| CLK       | Clock                        |
| CEA       | Port A clock enable          |
| CEB       | Port B clock enable          |
| WEA       | Port A write enable          |
| WEB       | Port A write enable          |
| CSA       | Port A chip select           |
| CSB       | Port B chip select           |
| RSTA      | Port A output register reset |

**Table 222: Input Ports (Continued)**

| Name        | Description                                                                                                    |
|-------------|----------------------------------------------------------------------------------------------------------------|
| RSTB        | Port B output register reset                                                                                   |
| BENA_N[3:0] | Write byte enable, 0=write 1=disable. BENA_N[3] corresponds to the MSB of DI, BENA_N[0] corresponds to the LSB |
| BENB_N[3:0] | Write byte enable, 0=write 1=disable. BENB_N[3] corresponds to the MSB of DI, BENB_N[0] corresponds to the LSB |
| CEOUTA      | Port A output register clock enable                                                                            |
| CEOUTB      | Port B output register clock enable                                                                            |

**Table 223: Output Ports**

| Name         | Description                       |
|--------------|-----------------------------------|
| DOA[31:0]    | Port A data out                   |
| DOB[31:0]    | Port B data out                   |
| ERRDECA[1:0] | Port A one and two bit error flag |
| ERRDECB[1:0] | Port B one and two bit error flag |

**Table 224: Parameters**

| Name                    | Values                                              | Description                       |
|-------------------------|-----------------------------------------------------|-----------------------------------|
| OUTREG_A                | "NO_REG" ( <i>default</i> )<br>"OUT_REG"            | Register output A                 |
| OUTREG_B                | "NO_REG" ( <i>default</i> )<br>"OUT_REG"            | Register output B                 |
| GSR                     | "ENABLED" ( <i>default</i> )<br>"DISABLED"          | Enable global set/reset           |
| RESETMODE               | "SYNC" ( <i>default</i> )<br>"ASYNC"                | Reset async/sync control          |
| INITVAL_00...INITVAL_7F | Hex string, 5120 bits, must include the "0x" prefix | LRAM initialization data          |
| ASYNC_RESET_RELEASE     | "SYNC" ( <i>default</i> )<br>"ASYNC"                | Reset release async/sync          |
| ECC_BYTE_SEL            | "ECC_EN" ( <i>default</i> )<br>"BYTE_EN"            | Enable ECC or Byte-enable support |

All inputs (except the register control signals) and all outputs are registered in the following manner:

## DQSBUF

To support DDR memory interfaces (DDR2/3, LPDDR2/3), the DQS strobe signal from the memory must be used to capture the data (DQ) in the PIC registers during memory reads.

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFMXO5
- ▶ LIFCL-40, LIFCL-17
- ▶ UT24C
- ▶ UT24CP

**Table 225: Input Ports**

| Name          | Description                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DQSI          | DQS signal from IO through the PIC                                                                                                                                                                                                                                                                                                                                                   |
| PAUSE         | To stop ECLK for DDR3 Write leveling and DLL code update                                                                                                                                                                                                                                                                                                                             |
| RDCLKSEL[3:0] | Select read clock source and polarity control (from CIB)                                                                                                                                                                                                                                                                                                                             |
| RDDIR         | 0 to increase the code, 1to decrease the code for DDR read                                                                                                                                                                                                                                                                                                                           |
| RDLOADN       | 1b0 - When mc1_mt_en_read=1b1 and read_load_n=1b0 the read_move pulse needs to be generated to the load the preload value consisting of the {mc1_sign_read,mc1_s_read[8:0]} value; 1b1 - When counter has preload value, read_move pulse can be used to increment and decrement the counter based on the read_direction signal's value and mc1_mt_en_write should be set 1b1.        |
| READ[3:0]     | Read signal for DDR read mode (from CIB)                                                                                                                                                                                                                                                                                                                                             |
| READMOVE      | Move pulse needs to be at least 1 sclk cycle and should be greater than 5ns at TT corner. Pulse is used along with the eclk to generate the internal "mov" signal to update the counter by one value. The count up or down is determined by the read_direction port.                                                                                                                 |
| RST           | DQS reset control for both DDR/CDR modes (from CIB)                                                                                                                                                                                                                                                                                                                                  |
| SCLK          | SCLK from SCLK tree (CIB)                                                                                                                                                                                                                                                                                                                                                            |
| SELCLK        | Select the clock to be used between the output of the read section's delay cell or sclk                                                                                                                                                                                                                                                                                              |
| WRDIR         | 0 - to increase the code, 1 - to decrease the code for DDR write                                                                                                                                                                                                                                                                                                                     |
| WRLOAD_N      | 1b0 - When mc1_mt_en_write=1b1 and write_load_n=1b0 the write_move pulse needs to be generated to the load the preload value consisting of the {mc1_sign_write,mc1_s_write[8:0]} value; 1b1 - When counter has preload value, write_move pulse can be used to increment and decrement the counter based on the write_direction signal's value and mc1_mt_en_write should be set 1b1. |

**Table 225: Input Ports (Continued)**

| Name         | Description                                                                                                                                                                                                                                                                    |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WRLVDIR      | 0 - to increase the code, 1 - to decrease the code for DDR write leveling                                                                                                                                                                                                      |
| WRLVLOAD_N   | 1b0 - 9-bit counter in reset operation; 1b1 - When mc1_mt_en_write_leveling=1b1 and write_leveling_load_n=1b1 the counter can be incremented/decremented based on the direction signal using the write_leveling_move signal                                                    |
| WRLVMOVE     | Move pulse needs to be at least 1 sclk cycle and should be greater than 5ns at TT corner. Pulse is used along with the eclk to generate the internal "mov" signal to update the counter by one value. The count up or down is determined by the write_leveling_direction port. |
| WRMOVE       | Move pulse needs to be at least 1 sclk cycle and should be greater than 5ns at TT corner. Pulse is used along with the eclk to generate the internal "mov" signal to update the counter by one value. The count up or down is determined by the write_direction port.          |
| ECLKIN       | ECLK from 4 different ECLK tree output                                                                                                                                                                                                                                         |
| RSTSMCNT     | Signal to reset the smoothing counters used for the Read, Write, and Write leveling delays.                                                                                                                                                                                    |
| DLLCODE[8:0] | DLL code selected from the DLL code routing mux                                                                                                                                                                                                                                |

**Table 226: Output Ports**

| Name        | Description                                                                                                                         |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------|
| BTDETECT    | READ burst detect output (to CIB)                                                                                                   |
| BURSTDetect | The burst_det_sclk signal is generated using burst_det and is asserted on the rising edge of SCLK                                   |
| DATAVALID   | Data Valid Flag for READ mode (to CIB)                                                                                              |
| DQSW        | ECLK phase shifted or delayed, goes to the dqsw tree through the PIC                                                                |
| DQSWRD      | The read training clock adjusted in the write section. The read_clk_sel[3:0] determines the selected delay and read enable position |
| RDPNTR[2:0] | FIFO control READ pointer (3-bits) to FIFO in PIC (through each tree to IOL)                                                        |
| READCOUT    | Margin test output flag for READ to indicate the underflow or overflow                                                              |
| DQSR90      | DQSI phase shifted or delayed by 90 degree output (through DQSR tree to IOL)                                                        |
| DQSW270     | ECLK phase shifted or delayed by 270 degree output (through DQSW270 tree to IOL)                                                    |
| WRCOUT      | Margin test output flag for WRITE to indicate the underflow or overflow                                                             |
| WRLVCOUT    | Margin test output flag for WRITE LEVELING to indicate the underflow or overflow                                                    |
| WRPNTR[2:0] | FIFO control WRITE pointer (3-bits) to FIFO in PIC (through each tree to IOL)                                                       |

**Table 227: Parameters**

| Name        | Values                                     | Description                       |
|-------------|--------------------------------------------|-----------------------------------|
| GSR         | "ENABLED" ( <i>default</i> )<br>"DISABLED" | GSRN signal enable/disable select |
| ENABLE_FIFO | "DISABLED" ( <i>default</i> )<br>"ENABLED" | Enable FIFO control               |

**Table 227: Parameters (Continued)**

| BYPASS_READ_SMTH_LATCH     | "SMOOTHING_PATH" (default)<br>"BYPASS_PATH"        | 1b0: Select the read smoothing path<br>1b1: Select the read smoothing bypass path, counter control based on Sapphire                                                                                                                                                                                                                                      |

**Note:**

The SIGN\_READ, S\_READ, SIGN\_WRITE, and S\_WRITE are all set to a value based on device performance. MAP will use fixed values for these components during the MAP.

To support DDR memory interfaces (DDR2/3, LPDDR2/3), the DQS strobe signal from the memory must be used to capture the data (DQ) in the PIC registers during memory reads.

**DQSBUFA**

Block generating DQS Signal for Memory LPDDR4 Functionality

Architectures supported:

- ▶ LFCPNX
- ▶ LFMXO5T
- ▶ UT24CP

**Table 228: Input Ports**

| Name          | Description                                              |
|---------------|----------------------------------------------------------|
| DQSI          | DQS signal from IO through the PIC                       |
| PAUSE         | To stop ECLK for DDR3 Write leveling and DLL code update |
| RDCLKSEL[3:0] | Select read clock source and polarity control (from CIB) |

**Table 228: Input Ports (Continued)**

| Name         | Description                                                                                                                                                                                                                                                                                                                                                                          |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RDDIR        | 0 to increase the code, 1 to decrease the code for DDR read                                                                                                                                                                                                                                                                                                                          |
| RDLOADN      | 1b0 - When mc1_mt_en_read=1b1 and read_load_n=1b0 the read_move pulse needs to be generated to the load the preload value consisting of the {mc1_sign_read,mc1_s_read[8:0]} value; 1b1 - When counter has preload value, read_move pulse can be used to increment and decrement the counter based on the read_direction signal's value and mc1_mt_en_write should be set 1b1.        |
| READ[3:0]    | Read signal for DDR read mode (from CIB)                                                                                                                                                                                                                                                                                                                                             |
| READMOVE     | Move pulse needs to be at least 1 sclk cycle and should be greater than 5ns at TT corner. Pulse is used along with the eclk to generate the internal "mov" signal to update the counter by one value. The count up or down is determined by the read_direction port.                                                                                                                 |
| RST          | DQS reset control for both DDR/CDR modes (from CIB)                                                                                                                                                                                                                                                                                                                                  |
| SCLK         | SCLK from SCLK tree (CIB)                                                                                                                                                                                                                                                                                                                                                            |
| SELCLK       | Select the clock to be used between the output of the read section's delay cell or sclk                                                                                                                                                                                                                                                                                              |
| WRDIR        | 0 - to increase the code, 1 - to decrease the code for DDR write                                                                                                                                                                                                                                                                                                                     |
| WRLOAD_N     | 1b0 - When mc1_mt_en_write=1b1 and write_load_n=1b0 the write_move pulse needs to be generated to the load the preload value consisting of the {mc1_sign_write,mc1_s_write[8:0]} value; 1b1 - When counter has preload value, write_move pulse can be used to increment and decrement the counter based on the write_direction signal's value and mc1_mt_en_write should be set 1b1. |
| WRLVDIR      | 0 - to increase the code, 1 - to decrease the code for DDR write leveling                                                                                                                                                                                                                                                                                                            |
| WRLVLOAD_N   | 1b0 - 9-bit counter in reset operation; 1b1 - When mc1_mt_en_write_leveling=1b1 and write_leveling_load_n=1b1 the counter can be incremented/decremented based on the direction signal using the write_leveling_move signal                                                                                                                                                          |
| WRLVMOVE     | Move pulse needs to be at least 1 sclk cycle and should be greater than 5ns at TT corner. Pulse is used along with the eclk to generate the internal "mov" signal to update the counter by one value. The count up or down is determined by the write_leveling_direction port.                                                                                                       |
| WRMOVE       | Move pulse needs to be at least 1 sclk cycle and should be greater than 5ns at TT corner. Pulse is used along with the eclk to generate the internal "mov" signal to update the counter by one value. The count up or down is determined by the write_direction port.                                                                                                                |
| ECLKIN       | ECLK from 4 different ECLK tree output                                                                                                                                                                                                                                                                                                                                               |
| RSTSMCNT     | Signal to reset the smoothing counters used for the Read, Write, and Write leveling delays.                                                                                                                                                                                                                                                                                          |
| DLLCODE[8:0] | DLL code selected from the DLL code routing mux                                                                                                                                                                                                                                                                                                                                      |

**Table 229: Output Ports**

| Name        | Description                                                                                       |
|-------------|---------------------------------------------------------------------------------------------------|
| BTDETECT    | READ burst detect output (to CIB)                                                                 |
| BURSTDetect | The burst_det_sclk signal is generated using burst_det and is asserted on the rising edge of SCLK |
| DATAVALID   | Data Valid Flag for READ mode (to CIB)                                                            |

**Table 229: Output Ports (Continued)**

| Name        | Description                                                                                                                         |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------|
| DQSW        | ECLK phase shifted or delayed, goes to the dqsw tree through the PIC                                                                |
| DQSWRD      | The read training clock adjusted in the write section. The read_clk_sel[3:0] determines the selected delay and read enable position |
| RDPNTR[2:0] | FIFO control READ pointer (3-bits) to FIFO in PIC (through each tree to IOL)                                                        |
| READCOUT    | Margin test output flag for READ to indicate the underflow or overflow                                                              |
| DQSR90      | DQSI phase shifted or delayed by 90 degree output (through DQSR tree to IOL)                                                        |
| DQSW270     | ECLK phase shifted or delayed by 270 degree output (through DQSW270 tree to IOL)                                                    |
| WRCOUT      | Margin test output flag for WRITE to indicate the underflow or overflow                                                             |
| WRLVCOUT    | Margin test output flag for WRITE LEVELING to indicate the underflow or overflow                                                    |
| WRPNTR[2:0] | FIFO control WRITE pointer (3-bits) to FIFO in PIC (through each tree to IOL)                                                       |

**Table 230: Parameters**

| Name                 | Values                                                                        | Description                                                                                                                  |
|----------------------|-------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| GSR                  | "ENABLED" (default)<br>"DISABLED"                                             | GSRN signal enable/disable select                                                                                            |
| ENABLE_FIFO          | "DISABLED" (default)<br>"ENABLED"                                             | Enable FIFO control                                                                                                          |

**Note:**

The SIGN\_READ, S\_READ, SIGN\_WRITE, and S\_WRITE are all set to a value based on device performance. MAP will use fixed values for these components during the MAP.

**DQSBUF\_IVREF**

To support DDR4 memory interfaces, the DQS strobe signal from the memory must be used to capture the data (DQ) in the PIC registers during memory reads, and the LPDDR4 internal VREF generator should be used to generated trained reference voltage for LPDDR4 IO buffers. DQSBUF\_IVREF combines the functions together.

Architectures supported:

- ▶ LFCPNX
- ▶ LFMXO5T
- ▶ LFMXO5TD
- ▶ UT24CP

**Table 231: Input Ports**

| Name          | Description                                                                                                                                                                                                                                                                                                                                                                             |

| RDCLKSEL[3:0] | Select read clock source and polarity control (from CIB)                                                                                                                                                                                                                                                                                                                                |
| RDDIR         | 0 to increase the code, 1to decrease the code for DDR read                                                                                                                                                                                                                                                                                                                              |
| RDLOADN       | 1b0 - When mc1_mt_en_read=1b1 and read_load_n=1b0 the read_move pulse needs to be generated to the load the preload value consisting of the {mc1_sign_read,mc1_s_read[8:0]} value.<br>1b1 - When counter has preload value, read_move pulse can be used to increment and decrement the counter based on the read_direction signal's value and mc1_mt_en_write should be set 1b1.        |
| READ[3:0]     | Read signal for DDR read mode (from CIB)                                                                                                                                                                                                                                                                                                                                                |
| READMOVE      | Move pulse needs to be at least 1 sclk cycle and should be greater than 5 ns at TT corner. Pulse is used along with the eclk to generate the internal "mov" signal to update the counter by one value. The count up or down is determined by the read_direction port.                                                                                                                   |
| RST           | DQS reset control for both DDR/CDR modes (from CIB)                                                                                                                                                                                                                                                                                                                                     |
| SCLK          | SCLK from SCLK tree (CIB)                                                                                                                                                                                                                                                                                                                                                               |
| SELCLK        | Select the clock to be used between the output of the read section's delay cell or sclk                                                                                                                                                                                                                                                                                                 |
| WRDIR         | 0 - to increase the code<br>1 - to decrease the code for DDR write                                                                                                                                                                                                                                                                                                                      |
| WRLOAD_N      | 1b0 - When mc1_mt_en_write=1b1 and write_load_n=1b0 the write_move pulse needs to be generated to the load the preload value consisting of the {mc1_sign_write,mc1_s_write[8:0]} value.<br>1b1 - When counter has preload value, write_move pulse can be used to increment and decrement the counter based on the write_direction signal's value and mc1_mt_en_write should be set 1b1. |
| WRLVDIR       | 0 - to increase the code<br>1 - to decrease the code for DDR write leveling                                                                                                                                                                                                                                                                                                             |

**Table 231: Input Ports (Continued)**

| Name         | Description                                                                                                                                                                                                                                                                     |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WRLVLOAD_N   | 1b0 - 9-bit counter in reset operation<br>1b1 - When mc1_mt_en_write_leveling=1b1 and write_leveling_load_n=1b1 the counter can be incremented/decremented based on the direction signal using the write_leveling_move signal                                                   |
| WRLVMOVE     | Move pulse needs to be at least 1 sclk cycle and should be greater than 5 ns at TT corner. Pulse is used along with the eclk to generate the internal "mov" signal to update the counter by one value. The count up or down is determined by the write_leveling_direction port. |
| WRMOVE       | Move pulse needs to be at least 1 sclk cycle and should be greater than 5 ns at TT corner. Pulse is used along with the eclk to generate the internal "mov" signal to update the counter by one value. The count up or down is determined by the write_direction port.          |
| ECLKIN       | ECLK from 4 different ECLK tree output                                                                                                                                                                                                                                          |
| RSTSMCNT     | Signal to reset the smoothing counters used for the Read, Write, and Write leveling delays.                                                                                                                                                                                     |
| DLLCODE[8:0] | DLL code selected from the DLL code routing mux                                                                                                                                                                                                                                 |
| IVREFI[6:0]  | VREF output control from cib. The step size is 5 mV.                                                                                                                                                                                                                            |

**Table 232: Output Ports**

| Name        | Description                                                                                       |
|-------------|---------------------------------------------------------------------------------------------------|
| BTDETECT    | READ burst detect output (to CIB)                                                                 |
| BURSTDetect | The burst_det_sclk signal is generated using burst_det and is asserted on the rising edge of SCLK |
| DATAVALID   | The burst_det_sclk signal is generated using burst_det and is asserted on the rising edge of SCLK |
| DQSW        | ECLK phase shifted or delayed, goes to the dqsw tree through the PIC                              |
| DQSWRD      | ECLK phase shifted or delayed, goes to the dqsw tree through the PIC                              |
| RDPNTR[2:0] | FIFO control READ pointer (3-bits) to FIFO in PIC (through each tree to IOL)                      |
| READCOUT    | Margin test output flag for READ to indicate the underflow or overflow                            |
| DQSR90      | DQSI phase shifted or delayed by 90 degree output (through DQSR tree to IOL)                      |
| DQSW270     | ECLK phase shifted or delayed by 270 degree output (through DQSW270 tree to IOL)                  |
| WRCOUT      | Margin test output flag for WRITE to indicate the underflow or overflow                           |
| WRLVCOUT    | Margin test output flag for WRITE to indicate the underflow or overflow                           |
| WRPNTR[2:0] | FIFO control WRITE pointer (3-bits) to FIFO in PIC (through each tree to IOL)                     |

**Table 233: Parameters**

| Name        | Values                            | Description                       |
|-------------|-----------------------------------|-----------------------------------|
| GSR         | "ENABLED" (default)<br>"DISABLED" | GSRN signal enable/disable select |
| ENABLE_FIFO | "DISABLED" (default)<br>"ENABLED" | Enable FIFO control               |

**Table 233: Parameters (Continued)**

| Name                 | Values                                                                        | Description                                                                                                                                                                                                                                                                                                                                               |

To support DDR4 memory interfaces, the DQS strobe signal from the memory must be used to capture the data (DQ) in the PIC registers during memory reads, and the LPDDR3 internal VREF generator should be used to generated trained reference voltage for LPDDR4 IO buffers. DQSBUF\_IVREF combines the functions together.

## DQSDLLC

Master DLL for Generating Required Delay

Architectures Supported:

▶ LFMXO4

**Table 234: Input Ports**

| Name     | Range | Description                                          |
|----------|-------|------------------------------------------------------|
| CLK      |       | Clock from the CIB.                                  |
| RST      |       | DLL reset control.                                   |
| UDDCNTLN |       | Hold/update control to delay code before adjustment. |
| FREEZE   |       | Signal used to freeze or release DLL input CLK.      |

**Table 235: Output Ports**

| Name   | Range | Description                                                                                              |
|--------|-------|----------------------------------------------------------------------------------------------------------|
| LOCK   |       | DLL delay control code to slave delay cells. Connected to DQSDEL of the <a href="#">DQSBUFH</a> element. |
| DQSDEL |       | DLL lock signal.                                                                                         |

**Table 236: Parameters**

| Name             | Values                                                  | Description                                                                  |
|------------------|---------------------------------------------------------|------------------------------------------------------------------------------|
| DEL_ADJ          | "PLUS" (default),<br>MINUS                              | DEL_ADJUST and ADJUST are set to a value based on device performance.        |
| DEL_VAL          | integers 0-127 (PLUS),<br>1-128 (MINUS)<br>(default: 0) | Static Delay Value                                                           |
| LOCK_SENSITIVITY | "LOW" (default),<br>"HIGH"                              | Selects greater or less sensitivity to the jitter.                           |
| FIN              | value range supported by<br>DLL (default: "100.0")      | Specifies the input frequency (MHz) designation for a PLL/<br>DLL primitive. |
| FORCE_MAX_DELAY  | :"NO" (default),<br>"YES"                               | DLL control code forcing.                                                    |
| GSR              | "ENABLED" (default),<br>"DISABLED"                      | Enable or disable GSR feature                                                |

**Description**

DQSDLLC is the master DLL to generate required delay.

**EBR\_B**

4 Kb pseudo-dual port block ram with configurable write/read width and optional bitstream initialization.

Architectures supported:

▶ iCE40 UltraPlus

**Table 237: Input Ports**

| Name               | Description        |
|--------------------|--------------------|
| RADDR10...RADDR0   | Read address       |
| WADDR10...WADDR0   | Write address      |
| MASK_N15...MASK_N0 | Write mask         |
| WDATA15...WDATA0   | Write data         |
| RCLKE              | Read clock enable  |
| RCLK               | Read clock         |
| RE                 | Read enable        |
| WCLKE              | Write clock enable |
| WCLK               | Write clock        |
| WE                 | Write enable       |

**Table 238: Output Ports**

| Name             | Description |
|------------------|-------------|
| RDATA15...RDATA0 | Read data   |

### Table 239: Parameters

| Name   | Values                                                                         | Description            |
|--------|--------------------------------------------------------------------------------|------------------------|
| INIT_0 | "0x0000000000000000000000000000000000000000000000000000000000000000" (default) | Initialization value 0 |

| DATA_WIDTH_R | "2" (default), "4", "8", "16"                                                  | Read data width in bits.  |

# ECLKBRIDGES

## ECLK Bridge Block Clock Select

▶ LFMX04

### Table 241: Output Ports

### Description

ECLK high speed bridge eases the design of high speed video or DDRX4 mode applications. It takes the high speed edge clocks sources from both sides (top and bottom). The bridge enhances the communication of ECLKs across the die. The bridge is supported for devices equal to or above 1200 LUTs.

## **ECLKBRIDGECS Usage with VHDL**

### **Library Instantiation**

```
library lattice;
use lattice.components.all;
```

### **Component Declaration**

```
component ECLKBRIDGECS
    port (CLK0    : in std_logic;
          CLK1    : in std_logic;
          SEL     : in std_logic;
          ECSOUT  : out std_logic);
end component;
```

### **ECLKBRIDGECS Instantiation**

```
I1: ECLKBRIDGECS
    port map (CLK0    => CLK0;
              CLK1    => CLK1;
              SEL     => SEL;
              ECSOUT  => ECSOUT);
end component;
```

## **ECLKBRIDGECS Usage with Verilog HDL**

### **Component Declaration**

```
module ECLKBRIDGECS (CLK0,
                     CLK1,
                     SEL,
                     ECSOUT);

    input CLK0;
    input CLK1;
    input SEL;
    output ECSOUT;
endmodule
```

### **ECLKBRIDGECS Instantiation**

```
ECLKBRIDGECS I1 (.CLK0 (CLK0),
                  .CLK1 (CLK1),
                  .SEL   (SEL),
```

```
.ECSOUT (ECSOUT));
```

For more information and usage, refer to the related technical notes on the Lattice web site.

## ECLKDIV

Wrapper for Clock Divider for Edge Clock

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 242: Input Ports**

| Name   | Description                   |
|--------|-------------------------------|
| ECLKIN | Clock signal after the DLLDEL |
| DIVRST | ECLKDIV reset                 |
| SLIP   | Slip output                   |

**Table 243: Output Ports**

| Name   | Description         |

**Table 248: Input Ports**

| Name   | Description                           |
|--------|---------------------------------------|
| ECLKIN | Clock signal after the DLLDEL         |
| STOP   | Control signal to stop the edge clock |

**Table 249: Output Ports**

| Name    | Description                    |
|---------|--------------------------------|
| ECLKOUT | Output ECLK after the ECLKSYNC |

**Table 250: Parameters**

| Name    | Values                          | Description         |
|---------|---------------------------------|---------------------|
| STOP_EN | "DISABLE" (default)<br>"ENABLE" | Stop enable control |

**Note:**

SYNC = 1 to SYNC = 0, it takes 4 clock cycles before ECLKIN appears in ECLKOUT.  
 SYNC = 0 to SYNC = 1, after 4 clock cycles, ECLKOUT goes to 0.

**ECLKSYNCA**

Wrapper for Clock Synchronizer for Edge Clock

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 251: Input Ports**

| Name   | Description                   |
|--------|-------------------------------|
| ECLKIN | Clock signal after the DLLDEL |
| SYNC   | ECLK sync function            |
| RST    | ECLKSYNC reset function       |

**Table 252: Output Ports**

| Name    | Description                    |
|---------|--------------------------------|
| ECLKOUT | Output ECLK after the ECLKSYNC |

**Note:****ECLKSYNCB**

ECLK Stop Block

Architectures Supported:

▶ LFMXO4

**Table 253: Input Ports**

| Name  | Range | Description                                                                        |
|-------|-------|------------------------------------------------------------------------------------|
| ECLKI | 1     | Edge clock input to the stop clock                                                 |
| STOP  | 1     | Control signal to stop the edge clock to synchronize the signals derived from ECLK |

**Table 254: Output Ports**

| Name  | Range | Description                           |
|-------|-------|---------------------------------------|
| ECLKO | 1     | Edge clock output from the stop clock |

**Description**

ECLKSYNCB is the optional ECLK synchronization for DDR\_MEM (DDR memory mode), DDR2\_MEM (DDR2 memory mode), and DDR3\_MEM (DDR3 memory mode).

- ▶ E and EA: DDR\_MEM, DDR2\_MEM, and DDR3\_MEM (left/right/top)

**ECLKSYNCB Usage with VHDL****Library Instantiation**

```
library lattice;
use lattice.components.all;
```

**Component Declaration**

```
component ECLKSYNCB
  port (ECLKI : in std_logic;
        STOP  : in std_logic;
        ECLKO : out std_logic);
end component;
```

**ECLKSYNCB Instantiation**

```
I1: ECLKSYNCB
  port map (ECLKI => ECLKI,
            STOP  => STOP,
            ECLKO => ECLKO);
end component;
```

**ECLKSYNCB Usage with Verilog HDL****Component Declaration**

```
module ECLKSYNCB (ECLKI, STOP, ECLKO);
```

```
input ECLKI;  
input STOP;  
output ECLKO;  
endmodule
```

### **ECLKSYNCB Instantiation**

```
ECLKSYNCB I1 (.ECLKI (ECLKI);  
              .STOP (STOP);  
              .ECLKO (ECLKO));
```

For more information and usage, refer to the related technical notes on the Lattice web site.

## **EFB**

Embedded Function Block

Architectures Supported:

▶ LFMXO4

**Table 255: Input Ports**

| Name    | Range | Description                 |
|---------|-------|-----------------------------|
| WBCLKI  | 1     | Wishbone Clock Input        |
| WBRSTI  | 1     | Wishbone Reset Input        |
| WBCYCI  | 1     | Wishbone Cycle Input        |
| WBSTBI  | 1     | Wishbone Strobe Input       |
| WBWEI   | 1     | Wishbone Write Enable Input |
| WBADRI7 | 1     | Wishbone Address Input      |
| WBADRI6 | 1     | Wishbone Address Input      |
| WBADRI5 | 1     | Wishbone Address Input      |
| WBADRI4 | 1     | Wishbone Address Input      |

**Table 255: Input Ports**

| <b>Name</b> | <b>Range</b> | <b>Description</b>                        |
|-------------|--------------|-------------------------------------------|
| WBADRI3     | 1            | Wishbone Address Input                    |
| WBADRI2     | 1            | Wishbone Address Input                    |
| WBADRI1     | 1            | Wishbone Address Input                    |
| WBADRI0     | 1            | Wishbone Address Input                    |

**Table 256: Output Ports**

| Name      | Range | Description                        |
|-----------|-------|------------------------------------|
| SPICSNEN  | 1     | Output Enable for chip select line |
| SPIIRQO   | 1     | SPI Interrupt Request Output       |
| TCINT     | 1     | Timer Interrupt Output             |
| TCOC      | 1     | Timer Output Compare signal        |
| WBCUFMIRQ | 1     | Wishbone Custom Frame Interrupt    |
| CFGWAKE   | 1     | Configuration Wake signal          |
| CFGSTDBY  | 1     | Configuration Standby signal       |

**Table 257: Parameters**

| Name                 | Value                 | Description                                                                       |
|----------------------|-----------------------|-----------------------------------------------------------------------------------|
| EFB_I2C1             | "DISABLED" (default)  | Enables I2C Primary User Port                                                     |
| EFB_I2C2             | "DISABLED" (default)  | Enables I2C Secondary User Port                                                   |
| EFB_SPI              | "DISABLED" (default)  | Enables the SPI Port                                                              |
| EFB_TC               | "DISABLED" (default)  | Enables Timer/Counter port                                                        |
| EFB_TC_PORTMODE      | "NO_WB" (default)     | Determined by T/C Static and Dynamic radio buttons                                |
| EFB_UFM              | "DISABLED" (default)  | Indicates that the user wants to use one of UFM0, UFM1, UFM2, UFM3, CFG0, or CFG1 |
| EFB_WB_CLK_FREQ      | "50.0" (default)      | Used by SPI and I2C to derive frequency                                           |
| DEV_DENSITY          | "015" (default)       | Specifies the device density                                                      |
| UFM_INIT_PAGES       | "0" (default)         | Specifies the number of pages with initialization data                            |
| UFM_INIT_START_PAGE  | "0" (default)         | Software calculates and displays the starting page of the init data               |
| UFM_INIT_ALL_ZEROS   | "ENABLED" (default)   | Specifies that UFM is initialized with all 0s                                     |
| UFM_INIT_FILE_NAME   | "NONE" (default)      | Uploads the UFM Initialization data file, where x holds value between 0 to 1      |
| UFM_INIT_FILE_FORMAT | "HEX" (default)       | Specifies the selection of file format, either Binary or Hexadecimal              |
| I2C1_ADDRESSING      | "7BIT" (default)      | Specifies the addressing scheme for i2c module                                    |
| I2C2_ADDRESSING      | "7BIT" (default)      | Specifies the addressing scheme for i2c module                                    |
| I2C1_SLAVE_ADDR      | "0b1000001" (default) | Specifies a default slave address during i2c hard IP generation                   |
| I2C2_SLAVE_ADDR      | "0b1000010" (default) | Specifies a default slave address during i2c hard IP generation                   |

**Table 257: Parameters (Continued)**

| Name                | Value                | Description                                                                                                                          |
|---------------------|----------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| I2C1_BUS_PERF       | "100kHz" (default)   | Master only. No software DRC for Master/Slave mode                                                                                   |
| I2C2_BUS_PERF       | "100kHz" (default)   | Master only. No software DRC for Master/Slave mode                                                                                   |
| I2C1_CLK_DIVIDER    | "1" (default)        | Read-Only display of I2C1_CLK_DIVIDER value                                                                                          |
| I2C2_CLK_DIVIDER    | "1" (default)        | Read-Only display of I2C2_CLK_DIVIDER value                                                                                          |
| I2C1_GEN_CALL       | "DISABLED" (default) | Enables the generic call response in Slave                                                                                           |
| I2C2_GEN_CALL       | "DISABLED" (default) | Enables the generic call response in Slave                                                                                           |
| I2C1_WAKEUP         | "DISABLED" (default) | Enables/disables the i2c core to send a wake up signal to the on chip power manager                                                  |
| I2C2_WAKEUP         | "DISABLED" (default) | Enables/disables the i2c core to send a wake up signal to the on chip power manager                                                  |
| SPI_MODE            | "SLAVE" (default)    | Allows you to select between Slave or Both mode for the initial state of the SPI block                                               |
| SPI_CLK_DIVIDER     | "1" (default)        | Allows you to specify a desired master clock frequency                                                                               |
| SPI_LSB_FIRST       | "DISABLED" (default) | Allows for programmable data order                                                                                                   |
| SPI_CLK_INV         | "DISABLED" (default) | Allows to program the clock polarity used to sample and output data withing the SPI core                                             |
| SPI_PHASE_ADJ       | "DISABLED" (default) | Allows you to specify a phase change to match the application                                                                        |
| SPI_SLAVE_HANDSHAKE | "DISABLED" (default) | Enables the core to insert certain values into the data stream to inform the external master when data can be sent                   |
| SPI_INTR_TXRDY      | "DISABLED" (default) | The core has configurable reset generation for data buffer conditions                                                                |
| SPI_INTR_RXRDY      | "DISABLED" (default) | The core has configurable reset generation for data buffer conditions                                                                |
| SPI_INTR_TXOVR      | "DISABLED" (default) | The core has configurable reset generation for data buffer conditions                                                                |
| SPI_INTR_RXOVR      | "DISABLED" (default) | The core has configurable reset generation for data buffer conditions                                                                |
| SPI_WAKEUP          | "DISABLED" (default) | Allows you to enable this feature where the core can optionally provide a wakeup signal to the device to resume from low-power modes |
| TC_MODE             | "CTCM" (default)     | Timer/Counter Mode Setting                                                                                                           |
| TC_SCLK_SEL         | "PCLOCK" (default)   | Timer/Counter Input Clock Setting                                                                                                    |
| TC_CCLK_SEL         | "1" (default)        | Timer/Counter Input Clock Divider Setting                                                                                            |
| GSR                 | "ENABLED" (default)  | Enables or disables the Global Set/Reset                                                                                             |

**Table 257: Parameters (Continued)**

| Name        | Value                | Description                                 |
|-------------|----------------------|---------------------------------------------|
| TC_TOP_SET  | "65535" (default)    | Specifies the Timer/Counter Top Set value   |
| TC_OCR_SET  | "32767" (default)    | Specified the Timer/Counter OCR Set value   |
| TC_OC_MODE  | "TOGGLE" (default)   | Mode Selection on TC_OC waveform generation |
| TC_RESETN   | "ENABLED" (default)  | Timer/Counter reset enable                  |
| TC_TOP_SEL  | "ON" (default)       | Sets Top Counter value                      |
| TC_OV_INT   | "OFF" (default)      | Timer/Counter overflow interrupt request    |
| TC_OCR_INT  | "OFF" (default)      | Timer/Counter interrupt request             |
| TC_ICR_INT  | "OFF" (default)      | The input capture interrupt                 |
| TC_OVERFLOW | "ENABLED" (default)  | Enables Timer/Counter for an overflow tag   |
| TC_ICAPTURE | "DISABLED" (default) | Enables Timer/Counter for input capture     |

**Description**

The EFB primitive has seven explicit interfaces: WISHBONE, SPI, I2C (Primary), I2C (Secondary), Timer/Counter, and two PLLs.

For detailed information regarding the GUI, interface, and usage regarding each EFB interface, refer to the related technical note on the Lattice web site.

**Table 258: Input Ports**

| Name        | Range | Description                                        |
|-------------|-------|----------------------------------------------------|
| CLKI        | 1     | Primary clock input to the PLL                     |
| CLKFB       | 1     | Clock feedback input                               |
| PHASESEL    | 1:0   | Phase selection control                            |
| PHASEDIR    | 1     | Phase direction control                            |
| PHASESTEP   | 1     | Phase step signal                                  |
| LOADREG     | 1     | Loads configuration registers into the PLL         |
| STDBY       | 1     | Standby control                                    |
| PLLWAKESYNC | 1     | Synchronization signal for waking PLL from standby |
| RST         | 1     | Reset                                              |
| RESETM      | 1     | Reset for the PLL main logic                       |
| RESETC      | 1     | Reset for the PLL clock                            |
| RESETD      | 1     | Reset for the PLL divider                          |
| ENCLKOP     | 1     | Enable output for primary PLL clock                |
| ENCLKOS     | -1:2  | Enable output for secondary PLL clock              |
| PLLCLK      | 1     | PLL clock signal                                   |
| PLLRST      | 1     | PLL reset signal                                   |

**Table 258: Input Ports**

| Name    | Range | Description             |
|---------|-------|-------------------------|
| PLLSTB  | 1     | PLL strobe signal       |
| PLLWE   | 1     | PLL write enable signal |
| PLLDATI | 7:0   | PLL data input bus      |
| PLLADDR | 4:0   | PLL address input bus   |

**Table 259: Output Ports**

| Name     | Range | Description                                        |
|----------|-------|----------------------------------------------------|
| CLKOP    | 1     | Primary PLL clock output                           |
| CLKOS    | -1:2  | Secondary PLL clock output                         |
| LOCK     | 1     | Indicates PLL has achieved lock on the input clock |
| INTLOCK  | 1     | Internal lock signal                               |
| REFCLK   | 1     | Reference clock input                              |
| CLKINTFB | 1     | Internal feedback clock                            |
| DPHSRC   | 1     | Dynamic phase source selection                     |
| PLLDATO  | 7:0   | PLL data output bus                                |
| PLLACK   | 1     | PLL acknowledge signal                             |

**Table 260: Parameters**

| Name           | Values                         | Description            |
|----------------|--------------------------------|------------------------|
| FREQ_PIN_CLKI  | "10" to "400" (default 100)    | CLKI frequency (MHz)   |
| FREQ_PIN_CLKOP | "3.125" to "400" (default 100) | CLKOP frequency (MHz)  |
| CLKI_DIV       | "1" (default) to "128"         | CLKI divider setting   |
| CLKFB_DIV      | "1" (default) to "128"         | CLKFB divider setting  |
| CLKOP_DIV      | "1" to "128" (default "8")     | CLKOP divider setting  |
| CLKOS_DIV      | "1" to "128" (default "8")     | CLKOS divider setting  |
| CLKOS2_DIV     | "1" to "128" (default "8")     | CLKOS2 divider setting |

**Table 260: Parameters**

| Name                | Values                                | Description                |
|---------------------|---------------------------------------|----------------------------|
| CLKOS3_DIV          | "1" to "128" (default "8")            | CLKOS3 divider setting     |
| CLOCK_ENABLE_POR TS | "ENABLED",<br>"DISABLED"<br>(default) | Clock enable ports         |
| CLKOP_ENABLE        | "ENABLED"<br>(default),<br>"DISABLED" | CLKOP enable               |
| CLKOS_ENABLE        | "ENABLED"<br>(default),<br>"DISABLED" | CLKOS enable               |
| CLKOS2_ENABLE       | "ENABLED"<br>(default),<br>"DISABLED" | CLKOS2 enable              |
| CLKOS3_ENABLE       | "ENABLED"<br>(default),<br>"DISABLED" | CLKOS3 enable              |
| VCO_BYPASS_A0       | "ENABLE",<br>"DISABLED"<br>(default)  | VCO bypass A0              |
| VCO_BYPASS_B0       | "ENABLE",<br>"DISABLED"<br>(default)  | VCO bypass B0              |
| VCO_BYPASS_C0       | "ENABLE",<br>"DISABLED"<br>(default)  | VCO bypass C0              |
| VCO_BYPASS_D0       | "ENABLE",<br>"DISABLED"<br>(default)  | VCO bypass D0              |
| CLKOP_CPHASE        | "0" (default) to "127"                | CLKOP coarse phase adjust  |
| CLKOS_CPHASE        | "0" (default) to "127"                | CLKOS coarse phase adjust  |
| CLKOS2_CPHASE       | "0" (default) to "127"                | CLKOS2 coarse phase adjust |
| CLKOS3_CPHASE       | "0" (default) to "127"                | CLKOS3 coarse phase adjust |
| CLKOP_FPHASE        | "0" (default) to "7"                  | CLKOP fine phase adjust    |
| CLKOS_FPHASE        | "0" (default) to "7"                  | CLKOS fine phase adjust    |
| CLKOS2_FPHASE       | "0" (default) to "7"                  | CLKOS2 fine phase adjust   |
| CLKOS3_FPHASE       | "0" (default) to "7"                  | CLKOS3 fine phase adjust   |

**Table 260: Parameters**

| Name             | Values                                                                                                                              | Description                                                  |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------|
| FEEDBK_PATH      | "CLKOP" (default),<br>"CLKOS",<br>"CLKOS2",<br>"CLKOS3",<br>"INT_DIVA",<br>"INT_DIVB",<br>"INT_DIVC",<br>"INT_DIVD",<br>"USERCLOCK" | Feedback mode                                                |
| FRACN_ENABLE     | "ENABLE",<br>"DISABLED" (default)                                                                                                   | Fractional-N divider enable                                  |
| FRACN_DIV        | "0" to "65535" (default 0)                                                                                                          | Fractional-N divider                                         |
| CLKOP_TRIM_DELAY | "0" (default), "1", "2", "4"                                                                                                        | CLKOP duty trim polarity delay                               |
| CLKOS_TRIM_POL   | "RISING" (default),<br>"FALLING"                                                                                                    | CLKOS duty trim polarity                                     |
| CLKOS_TRIM_DELAY | "0" (default), "1", "2", "4"                                                                                                        | CLKOS duty trim polarity delay                               |
| PLL_USE_WB       | "ENABLE",<br>"DISABLED" (default)                                                                                                   | Enables Wishbone interface for PLL configuration and control |
| PREDIVIDER_MUXA1 | "0" (default) to "3"                                                                                                                | Selects input source for pre-divider A                       |
| PREDIVIDER_MUXB1 | "0" (default) to "3"                                                                                                                | Selects input source for pre-divider B                       |
| PREDIVIDER_MUXC1 | "0" (default) to "3"                                                                                                                | Selects input source for pre-divider C                       |
| PREDIVIDER_MUXD1 | "0" (default) to "3"                                                                                                                | Selects input source for pre-divider D                       |
| OUTDIVIDER_MUXA2 | "DIVA" (default),<br>"REFCLK"                                                                                                       | Selects output source for divider A                          |
| OUTDIVIDER_MUXB2 | "DIVB" (default),<br>"REFCLK"                                                                                                       | Selects output source for divider B                          |

| DDRST_ENA     | "ENABLED",<br>"DISABLED"<br>(default) | Enables data path reset                         |

**Description**

A wrapper will be used around the primitive for configurations without the dynamic control or other ports. The EHXPLLJ primitive uses a single reference clock input.

For detailed information, refer to the related technical note on the Lattice web site.

**FA2**

Carry chain 2-bit full adder

Architectures supported:

- ▶ iCE40 UltraPlus

**Table 261: Input Ports**

| Name | Description         |
|------|---------------------|
| A0   | Non-operand A bit 0 |
| B0   | Operand B bit 0     |
| C0   | Operand C bit 0     |
| D0   | Operand D bit 0     |
| CI0  | Carry-in 0          |
| A1   | Non-operand A bit 1 |
| B1   | Operand B bit 1     |
| C1   | Operand C bit 1     |
| D1   | Operand D bit 1     |
| CI1  | Carry-in 1          |

**Table 262: Output Ports**

| Name | Description             |
|------|-------------------------|
| CO0  | Carry-out 0             |
| CO1  | Carry-out 1             |
| S0   | Output bit 0 of the sum |
| S1   | Output bit 1 of the sum |

**Table 263: Parameters**

| Name  | Values                      | Description        |
|-------|-----------------------------|--------------------|
| INIT0 | "0xc33c" ( <i>default</i> ) | Hexadecimal value. |
| INIT1 | "0xc33c" ( <i>default</i> ) | Hexadecimal value. |

**Table 264: Truth Table (Continued)**

| Inputs |    |      |    |    |      | Outputs |     |    |    |     |     |
|--------|----|------|----|----|------|---------|-----|----|----|-----|-----|
| B1     | C1 | D1   | BO | CO | DO   | CI1     | CI0 | S1 | SO | CO1 | CO0 |
| 1      | 1  | =CI1 | 1  | 1  | =CI0 | =CO0    | 0   | 1  | 0  | 1   | 1   |
| 1      | 1  | =CI1 | 1  | 1  | =CI0 | =CO0    | 1   | 1  | 1  | 1   | 1   |

**Note:**

In the Truth Table, ports A0 and A1 are tied low or are unconnected.

## Rules and restrictions:

- ▶ Carry-out (CO0, CO1) can only go to D input of LUT above it or next (CI0, CI1).
- ▶ To drive VHI to the first carry-in, CI0, do not tie CI0 to 1 or VHI. Instead, leave it dangling. Bitgen will ensure that CI0 will correctly be VHI as expected.
- ▶ To drive VLO to the first carry-in, CI0 should be left dangling and half a FA2 must be used. This is done by grounding B0 and C0 and leaving D0 floating. This will ensure that CI1 will correctly be VLO as expected and the second half of FA2 can be used normally.
- ▶ If you want to bring out last carry-out (CO0, CO1) to fabric, simply connect the carry-out to whatever is your fabric logic. Map and Placer will work to insert a LUT and place it in the appropriate location automatically (thus ensuring the first rule is followed).

See Figure 2, Figure 3, and Figure 4, below, that take into account the above rules. The examples below do not make use of the A0 or A1 ports as they are not needed for 2-bit full-adder functionality.

| 1      | 1  | ↑  | 1       |

X = Don't care

When GSR=0, Q=0 (D=SP=CK=X)

## FD1P3AY

Positive Edge Triggered D Flip-Flop with Positive Level Enable, GSR Used for Preset

Architectures Supported:

▶ LFMXO4

**Table 283: Input Ports**

| Name | Range | Description           |
|------|-------|-----------------------|
| D    | 1     | Data Input            |
| SP   | 1     | Positive Clock Enable |
| CK   | 1     | Clock Input           |

**Table 284: Output Ports**

| Name | Range | Description |
|------|-------|-------------|
| Q    | 1     | Data Output |

**Table 285: Parameters**

| Name | Values                             | Description                   |
|------|------------------------------------|-------------------------------|
| GSR  | "ENABLED" (default),<br>"DISABLED" | Enable or disable GSR feature |

**Table 286: Truth Table**

| Inputs |    |    | Outputs |
|--------|----|----|---------|
| D      | SP | CK | Q       |
| X      | 0  | X  | Q       |
| 0      | 1  | ↑  | 0       |
| 1      | 1  | ↑  | 1       |

X = Don't care

When GSR=0, Q=1 (D=SP=CK=X)

## FD1P3IX

Positive-Edge-Triggered D Flip-Flop with Positive-Level Synchronous Clear and Positive-Level Enable

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO4
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ LN2-CT
- ▶
- ▶ UT24C
- ▶ UT24CP

**Table 287: Input Ports**

| Name | Description                                               |
|------|-----------------------------------------------------------|
| D    | Data in                                                   |
| SP   | Clock enable                                              |
| CK   | Clock                                                     |
| CD   | Clear, active high. Clock enable must be active to clear. |

**Table 288: Output Ports**

| Name | Description |
|------|-------------|
| Q    | Data out    |

**Table 289: Parameters**

| Name | Values                                     | Description              |
|------|--------------------------------------------|--------------------------|
| GSR  | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable global set/reset. |

**Table 290: Truth Table**

| Inputs |    |    |    | Output |
|--------|----|----|----|--------|
| D      | SP | CK | CD | Q      |
| X      | 0  | X  | 0  | Q      |
| X      | X  | ↑  | 1  | 0      |
| 0      | 1  | ↑  | 0  | 0      |
| 1      | 1  | ↑  | 0  | 1      |

X = Don't care

When GSR = 0, Q = 0 (D = SP = CK = CD = X)

## FD1P3IZ

Positive-Edge-Triggered D Flip-Flop with Positive-Level Synchronous Clear and Positive-Level Enable

Architectures supported:

▶ iCE40 UltraPlus

**Table 291: Input Ports**

| Name | Description                                               |
|------|-----------------------------------------------------------|
| D    | Data in                                                   |
| SP   | Clock enable, active high                                 |
| CK   | Clock                                                     |
| CD   | Clear, active high. Clock enable must be active to clear. |

**Table 292: Output Ports**

| Name | Description |
|------|-------------|
| Q    | Data out    |

**Table 293: Truth Table**

| Inputs |    |    |    | Output |
|--------|----|----|----|--------|

X = Don't care

When GSR=0, Q=1 (D=CK=PD=X)

## FIFO8KB

8K FIFO Block RAM

Architecture Supported:

▶ LFMXO4

**Table 328: Input Ports**

| Name   | Range | Description              |
|--------|-------|--------------------------|
| WE     | 1     | Write clock enable       |
| RE     | 1     | Read clock enable        |
| ORE    | 1     | Read output clock enable |
| CLKW   | 11    | Write clock              |
| CLKR   | 1     | Read clock               |
| RST    | 1     | Reset write pointers     |
| RPRST  | 1     | Reset read pointers      |
| FULLI  | 1     | Chip select write        |
| EMPTYI | 1     | Chip select read         |
| CSW    | 1:0   | Chip select write        |
| CSR    | 1:0   | Chip select read         |
| DI     | 17:0  | Write data               |

**Table 329: Output Ports**

| Name | Range | Description       |
|------|-------|-------------------|
| EF   | 1     | Empty flag        |
| AEF  | 1     | Almost empty flag |
| AFF  | 1     | Almost full flag  |

**Table 329: Output Ports**

| Name | Range | Description |
|------|-------|-------------|
| FF   | 1     | Full flag   |
| DO   | 17:0  | Read data   |

**Table 330: Parameters**

| Name               | Values                             | Description                                                                                                                                                                                                                                                        |
|--------------------|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DATA_WIDTH_W       | "1", "2", "4", "9", "18" (default) | Write data word width. Attached to a memory type primitive.                                                                                                                                                                                                        |
| DATA_WIDTH_R       | "1", "2", "4", "9", "18" (default) | Read data word width. Attached to a memory type primitive.                                                                                                                                                                                                         |
| REGMODE            | "NOREG" (default), "OUTREG"        | Specifies the register mode for pipelining.                                                                                                                                                                                                                        |
| RESETMODE          | "SYNC" (default), "ASYN"           | Specifies the reset type. This attribute is attached to a block RAM-type primitive that has a memory size smaller than 9 bits. When set to SYNC, the memory reset is synchronized with the clock. When set to ASYN, the memory reset is asynchronous to the clock. |
| CSDECODE_W         | "0b00"                             | Attached to a single-port block RAM primitive. The CSDECODE value determines the decoding value of CS[2:0]. A value set to "000" means that the memory is selected if CS[2:0]=1'B000. This is tied with Write operations.                                          |
| CSDECODE_R         | "0b00"                             | Attached to a single-port block RAM primitive. The CSDECODE value determines the decoding value of CS[2:0]. A value set to "000" means that the memory is selected if CS[2:0]=1'B000. This is tied with Read operations.                                           |
| GSR                | "DISABLED" (default), "ENABLED"    | Enables or disables the Global Set/Reset (GSR) for all registered primitives. Applicable to registers, PLLs, and memories such as SP8KA and DP8KA.                                                                                                                 |
| RESETMODE          | "ASYN" (default), "SYNC"           | Reset type. This attribute is attached to a block RAM-type primitive that has a memory size smaller than 9 bits. When set to SYNC, the memory reset is synchronized with the clock. When set to ASYN, the memory reset is asynchronous to the clock.               |
| ASYN_RESET_RELEASE | "SYNC" (default), "ASYN"           | Reset release when the reset mode is ASYN.                                                                                                                                                                                                                         |
| AEPOINTER          | "0b0000000000000000"               | Almost Empty Flag Pointer                                                                                                                                                                                                                                          |
| AEPOINTER1         | "0b0000000000000000"               | Almost Empty Flag Pointer 1                                                                                                                                                                                                                                        |
| AFPOINTER          | "0b0000000000000000"               | Almost Full Flag Pointer                                                                                                                                                                                                                                           |
| AFPOINTER1         | "0b0000000000000000"               | Almost Full Flag Pointer 1                                                                                                                                                                                                                                         |

**Table 330: Parameters**

| Name         | Values               | Description                                     |
|--------------|----------------------|-------------------------------------------------|
| FULLPOINTER  | "0b0000000000000000" | Full Flag Pointer. Attached to a FIFO primitive |
| FULLPOINTER1 | "0b0000000000000000" | Full Flag Pointer 1                             |

## FIFO16K

16 Kb FIFO using block RAM

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 331: Input Ports**

| Name     | Description                                                   |
|----------|---------------------------------------------------------------|
| DI[35:0] | Input data                                                    |
| CLKW     | Write clock. Active on the rising edge. Has polarity control. |
| WE       | Write enable. Active high. Has polarity control.              |
| FULLI    | Write inhibit. Active high. Has polarity control.             |
| CSW[1:0] | Write cascade select. Active high. Has polarity control.      |
| RSTW     | Write reset. Active high. Has polarity control.               |
| CLKR     | Read clock. Active on the rising edge. Has polarity control.  |
| RE       | Read enable. Active high. Has polarity control.               |
| EMPTYI   | Read inhibit. Active high. Has polarity control.              |
| CSR[1:0] | Read cascade select. Active high. Has polarity control.       |
| RPRST    | Read point reset. Active high. Has polarity control.          |

**Table 332: Output Ports**

| Name        | Description                       |
|-------------|-----------------------------------|
| DO[35:0]    | Output data                       |
| ONEBITERR   | ECC error flag for a 1-bit error. |
| TWOBITERR   | ECC error flag for a 2-bit error. |
| ALMOSTFULL  | Almost full flag                  |
| FULL        | Full flag                         |
| ALMOSTEMPTY | Almost empty flag                 |
| EMPTY       | Empty flag                        |

**Table 333: Parameters**

| Name              | Values                                                                     | Description                                                   |
|-------------------|----------------------------------------------------------------------------|---------------------------------------------------------------|
| DATA_WIDTH_W      | "X36" ( <i>default</i> )<br>"X32"<br>"X18"<br>"X9"<br>"X4"<br>"X2"<br>"X1" | Specifies the Data Word Width                                 |
| DATA_WIDTH_R      | "X36" ( <i>default</i> )<br>"X32"<br>"X18"<br>"X9"<br>"X4"<br>"X2"<br>"X1" | Specifies the Data Word Width                                 |
| OUTREG            | "BYPASSED"<br>( <i>default</i> )<br>"USED"                                 | Output register                                               |
| GSR               | "ENABLED" ( <i>default</i> )<br>"DISABLED"                                 | Enable or disable GSR feature                                 |
| RESETMODE         | "SYNC" ( <i>default</i> )<br>"ASYNC"                                       | Specifies the reset type                                      |
| ASYNC_RST_RELEASE | "SYNC" ( <i>default</i> )<br>"ASYNC"                                       | Reset release sync/async control                              |
| ECC               | "DISABLED" ( <i>default</i> )<br>"ENABLED"                                 | Enable ECC                                                    |
| CSDECODE_W        | 00 ( <i>default</i> )<br>01<br>10<br>11                                    | Attached to a single-port block RAM primitive                 |
| CSDECODE_R        | 00 ( <i>default</i> )<br>01<br>10<br>11                                    | Attached to a single-port block RAM primitive                 |
| FULLBITS          | 0b1000000000000000<br>( <i>default</i> )                                   | Specifies the FIFO size for FULL flag. By default, it is 18k. |
| ALMOST_FULL       | 0b0000000000000000<br>( <i>default</i> )                                   | The value must be less than FULLBITS.                         |
| ALMOST_EMPTY      | 0b0000000000000000<br>( <i>default</i> )                                   | The value must be greater than 0.                             |

## FIFO32K

32 Kb FIFO using block RAM

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 334: Input Ports**

| Name  | Range | Type    | Active State | Description                  |
|-------|-------|---------|--------------|------------------------------|
| DI    | 71:0  | Data    | Active High  | Data Inputs                  |
| CLKW  | 1     | Clock   | Rising Edge  | Write Clock Input            |
| CLKR  | 1     | Clock   | Rising Edge  | Read Clock Input             |
| RSTW  | 1     | Control | Active High  | Write Reset                  |
| RPRST | 1     | Control | Active High  | Read point reset             |
| CEW   | 1     | Control | Active High  | Write Clock Enable           |
| CER   | 1     | Control | Active High  | Read Clock Enable            |
| OCE   | 1     | Control | Active High  | Output Register Clock Enable |
| CSW   | 2:0   | Control | Active High  | Write Cascade Select         |
| CSR   | 2:0   | Control | Active High  | Read Cascade Select          |

**Table 335: Output Ports**

| Name      | Range | Type | Active State | Description           |
|-----------|-------|------|--------------|-----------------------|
| DO        | 71:0  | Data | Active High  | Data Output           |
| ONEBITERR | 1     | Data | Active High  | Single Bit Error Flag |
| TWOBITERR | 1     | Data | Active High  | Double Bit Error Flag |
| FULL      | 1     | Data | Active High  | Full Flag             |
| EMPTY     | 1     | Data | Active High  | Empty Flag            |

**Table 335: Output Ports (Continued)**

| Name        | Range | Type | Active State | Description       |
|-------------|-------|------|--------------|-------------------|
| ALMOSTFULL  | 1     | Data | Active High  | Almost Full Flag  |
| ALMOSTEMPTY | 1     | Data | Active High  | Almost Empty Flag |

**Table 336: Parameters**

| Name              | Values                                                                     | Description                                                        |
|-------------------|----------------------------------------------------------------------------|--------------------------------------------------------------------|
| ALMOST_EMPTY      | "0b0000000000000000"(default)                                              | The value must be greater than 0                                   |
| ALMOST_FULL       | "0b0000000000000000"(default)                                              | The value must be less than FULLBITS                               |
| ASYNC_RST_RELEASE | "SYNC" (default)<br>"ASYNC"                                                | Reset release sync/async control                                   |
| CSDECODE_R        | "000"                                                                      | Read chip select active setting, 0=active high<br>1=active low     |
| CSDECODE_W        | "000"                                                                      | Write chip select active level, 0=active high 1=active low         |
| DATA_WIDTH_R      | "X72" (default)<br>"X64"<br>"X36"<br>"X18"<br>"X9"<br>"X4"<br>"X2"<br>"X1" | Read port width                                                    |
| DATA_WIDTH_W      | "X72" (default)<br>"X64"<br>"X36"<br>"X18"<br>"X9"<br>"X4"<br>"X2"<br>"X1" | Write port width                                                   |
| ECC               | "DISABLED" (default)<br>"ENABLED"                                          | Enable ECC                                                         |
| FULLBITS          | "0b1000000000000000"(default)                                              | Specifies the FIFO size for FULL flag; by default FIFO size is 36K |
| FWFT              | "DISABLED" (default)                                                       | First Word Fall Through Mode                                       |

**Table 336: Parameters (Continued)**

| Name      | Values                            | Description                                      |
|-----------|-----------------------------------|--------------------------------------------------|
| GSR       | "ENABLED" (default)<br>"DISABLED" | Enable global set/reset for the output registers |
| OUTREG    | "BYPASSED" (default)<br>"USED"    | Register output                                  |
| RESETMODE | "SYNC" (default)<br>"ASYNC"       | Synchronous/asynchronous reset control           |

## FILTER

Adds a 50-ns delay to a signal

Architectures supported:

- ▶ iCE40 UltraPlus

**Table 337: Input Ports**

| Name     | Description  |
|----------|--------------|
| FILTERIN | Filter input |

**Table 338: Output Ports**

| Name      | Description   |
|-----------|---------------|
| FILTEROUT | Filter output |

## GSR

Wrapper for Global Set/Reset

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5

- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 339: Input Ports**

| Name  | Description              |
|-------|--------------------------|
| GSR_N | User GSR input           |
| CLK   | User clock for sync mode |

**Table 340: Parameters**

| Name     | Values                      | Description                 |
|----------|-----------------------------|-----------------------------|
| SYNCMODE | "ASYNC" (default)<br>"SYNC" | Synchronization Mode Select |

GSR is used to reset or set all register elements in your design. The GSR component can be connected to a net from an input buffer or an internally generated net. It is active LOW and when pulsed will set or reset all flip-flops, latches, registers, and counters to the same state as the local set or reset functionality. When input GSR is HIGH, the global signal is released at the positive edge of the clock (CLK) if SYNCMODE is SYNC; otherwise, the signal is released asynchronously.

It is not necessary to connect signals for GSR to any register elements explicitly. The function will be implicitly connected globally. The functionality of the GSR for sequential cells without a local set or reset are described in the appropriate primitive description.

In general, The GSR instantiation in testbench is required when RTL design is composed of Lattice Components/Primitives that requires a GSR net connection in its simulation model. Some of examples of these components are IO/DDR, Registers, DSP, and Hard Ips (like PCIe, SGMII, DPHY). It is also required if a Netlist simulation (post-synthesis and post-route) is performed as it contains synthesized and translated primitives from the User RTL. The best place to add the GSR is the testbench, do not instantiate the GSR primitive in the RTL unless it is needed.

## GSRA

Global Set/Reset

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 341: Input Ports**

| Name  | Description                  |
|-------|------------------------------|
| GSR_N | User GSR input, asynchronous |

### Note:

The GSRA primitive needs to be instantiated in the user design.

## GSRB

Global Set/Reset Interface

Architectures Supported:

- ▶ LFMXO4

**Table 342: Input Ports**

| Name | Range | Description                             |
|------|-------|-----------------------------------------|
| GSR  | 1     | Set all register elements in the design |

### Description

GSRB is used to reset or set all register elements in your design. The GSR component can be connected to a net from an input buffer or an internally generated net. It is active LOW and when pulsed will set or reset all flip-flops, latches, registers, and counters to the same state as the local set or reset functionality.

It is not necessary to connect signals for GSR to any register elements explicitly. The function will be implicitly connected globally. The functionality of the GSR for sequential cells without a local set or reset are described in the appropriate library help page.

## HSOSC

High-frequency oscillator. Generates 48-MHz nominal clock, +/- 10 percent, with user-programmable divider. Can drive global clock network or fabric routing.

Architectures supported:

- ▶ iCE40 UltraPlus

**Table 343: Input Ports**

| Name    | Description                                                                                      |
|---------|--------------------------------------------------------------------------------------------------|
| CLKHFPU | Power up the oscillator. After power up, output will be stable after 100 $\mu$ s. Active high.   |
| CLKHFEN | Enable the clock output. Enable should be low for the 100- $\mu$ s power-up period. Active high. |

**Table 344: Output Ports**

| Name  | Description       |
|-------|-------------------|
| CLKHF | Oscillator output |

**Table 345: Parameters**

| Name      | Values                                                      | Description                                                                                     |
|-----------|-------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| CLKHF_DIV | "0'b00" ( <i>default</i> )<br>"0'b01"<br>"0'b10"<br>"0'b11" | Clock divider selection:<br>0'b00 = 48 MHz<br>0'b01 = 24 MHz<br>0'b10 = 12 MHz<br>0'b11 = 6 MHz |

Same as: SB\_HFOSC

## HSOSC1P8V

High-frequency oscillator. Generates 48-MHz nominal clock, +/- 10 percent, with user-programmable divider. Can drive global clock network or fabric routing. For use when VPP\_2V5 is connected to a voltage below 2.3 V.

Architectures supported:

- ▶ iCE40 UltraPlus

**Table 346: Input Ports**

| Name    | Description                                                                                     |
|---------|-------------------------------------------------------------------------------------------------|
| CLKHFPU | Power up the oscillator. After power up, output will be stable after 100 $\mu$ s. Active high   |
| CLKHFEN | Enable the clock output. Enable should be low for the 100- $\mu$ s power up period. Active high |

**Table 347: Output Ports**

| Name  | Description       |
|-------|-------------------|
| CLKHF | Oscillator output |

**Table 348: Parameters**

| Name      | Values                                        | Description                                                                               |
|-----------|-----------------------------------------------|-------------------------------------------------------------------------------------------|
| CLKHF_DIV | 0'b00" (default),<br>"0'b01", "0'b10", "0'b11 | Clock divider selection. 0'b00 = 48 MHz, 0'b01 = 24 MHz, 0'b10 = 12 MHz,<br>0'b11 = 6 MHz |

## I2C\_B

Hard I2C interface

Architectures supported:

- ▶ iCE40 UltraPlus

## IB

Input Buffer

Architectures supported:

- ▶ iCE40 UltraPlus
- ▶ LAV-AT-ES1
- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO4
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ LN2-CT
- ▶
- ▶ UT24C
- ▶ UT24CP

**Table 355: Input Ports**

| Name | Description   |
|------|---------------|
| I    | Data from pad |

**Table 356: Output Ports**

| Name | Description    |
|------|----------------|
| O    | Data to fabric |

In iCE40 UltraPlus, refer to Source Template.

**Table 357: Truth Table**

| Input | Output |
|-------|--------|
| I     | O      |
| 1     | 1      |
| 0     | 0      |
| Z     | U      |

## IDDR71

7:1 LVDS IDDR

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

This primitive is used for 7:1 LVDS input implementation.

**Table 358: Input Ports**

| Name    | Description                                 |
|---------|---------------------------------------------|
| D       | DDR data input                              |
| ECLK    | Fast edge clock                             |
| SCLK    | Primary clock input (divide-by-3.5 of ECLK) |
| RST     | Reset to DDR registers                      |
| ALIGNWD | Shifts word alignment by one bit            |

**Table 359: Output Ports**

| Name   | Description |
|--------|-------------|
| Q[6:0] | Output data |

**Table 360: Parameters**

| Name | Values                                     | Description              |
|------|--------------------------------------------|--------------------------|
| GSR  | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable global set/reset. |

**Note**

Avoid using IDDRX2/ODDRX2 and above gearing on a BIDI I/O.

- ▶ Only IDDRX1 and ODDRX1 can be used with a single BIDI I/O.
- ▶ If using IDDRX2 and above gearing, this must be used only with an INPUT.
- ▶ If using ODDRX2 and above gearing, this must be used only with an OUTPUT.

**IDDR71A**

7:1 LVDS input side implementation

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 361: Input Ports**

| Name    | Range | Type    | Active State | Description                                                                |
|---------|-------|---------|--------------|----------------------------------------------------------------------------|
| D       | 1     | Data    | High         | DDR data input                                                             |
| ECLK    | 1     | Clock   | Rising Edge  | Fast edge clock                                                            |
| SCLK    | 1     | Clock   | Rising Edge  | Primary clock input<br>(divide-by-3.5 of ECLK)                             |
| RST     | 1     | Control | High         | Reset to DDR registers                                                     |
| ALIGNWD | 1     | Control | High         | This signal is used for word alignment. It will shift the word by one bit. |

**Table 362: Output Ports**

| Name              | Range | Type | Active State | Description                       |
|-------------------|-------|------|--------------|-----------------------------------|
| Q0, Q2,<br>Q4, Q6 | 4     | Data | High         | Data at the positive edge of ECLK |
| Q1, Q3, Q5        | 3     | Data | High         | Data at the negative edge of ECLK |

**Table 363: Parameters**

| Name | Value                   | Description                   |
|------|-------------------------|-------------------------------|
| GSR  | "ENABLED"<br>"DISABLED" | Enable or disable GSR feature |

**Note**

Avoid using IDDRX2/ODDRX2 and above gearing on a BIDI I/O.

- ▶ Only IDDRX1 and ODDRX1 can be used with a single BIDI I/O.
- ▶ If using IDDRX2 and above gearing, this must be used only with an INPUT.
- ▶ If using ODDRX2 and above gearing, this must be used only with an OUTPUT.

**IDDRX1**

Generic X1 IDDR

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

This primitive is used for the Generic x1 IDDR implementation.

**Table 364: Input Ports**

| Name | Description            |
|------|------------------------|
| D    | DDR data input         |
| SCLK | Primary clock input    |
| RST  | Reset to DDR registers |

**Table 365: Output Ports**

| Name | Description                            |
|------|----------------------------------------|
| Q0   | Data at the positive edge of the clock |
| Q1   | Data at the negative edge of the clock |

**Table 366: Parameters**

| Name | Values                                     | Description              |
|------|--------------------------------------------|--------------------------|
| GSR  | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable global set/reset. |

## IDDRX1A

Generic DDR with 1X gearing

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 367: Input Ports**

| Name | Range | Type    | Active State | Description            |
|------|-------|---------|--------------|------------------------|
| D    | 1     | Data    | High         | DDR data input         |
| SCLK | 1     | Clock   | Rising Edge  | Primary clock input    |
| RST  | 1     | Control | High         | Reset to DDR registers |

**Table 368: Output Ports**

| Name | Range | Type | Active State | Description                            |
|------|-------|------|--------------|----------------------------------------|
| Q0   | 1     | Data | High         | Data at the positive edge of the clock |
| Q1   | 1     | Data | High         | Data at the negative edge of the clock |

**Table 369: Parameters**

| Name | Value      | Description                   |
|------|------------|-------------------------------|
| GSR  | "ENABLED"  | Enable or disable GSR feature |
|      | "DISABLED" |                               |

## IDDRX2

Generic X2 IDDR

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

This primitive is used for the generic X2 IDDR implementation.

**Table 370: Input Ports**

| Name | Range | Description                                |
|------|-------|--------------------------------------------|
| D    | 1     | DDR data input.                            |
| SCLK | 1     | Primary clock input (divide-by-2 of ECLK). |
| RST  | 1     | Reset to DDR registers.                    |

**Table 370: Input Ports (Continued)**

| Name    | Range | Description                       |
|---------|-------|-----------------------------------|
| ECLK    | 1     | Fast edge clock.                  |
| ALIGNWD | 1     | Shifts word alignment by one bit. |

**Table 371: Output Ports**

| Name | Range | Description                                                                                                                               |
|------|-------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Q    | 3:0   | Parallel data output. Q0, Q2 are the data at the positive edges of the input ECLK. Q1 and Q3 are the data at negative edge of input ECLK. |

**Table 372: Parameters**

| Name | Values                                     | Description              |
|------|--------------------------------------------|--------------------------|
| GSR  | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable global set/reset. |

**Note**

Avoid using IDDRX2/ODDRX2 and above gearing on a BIDI I/O.

- ▶ Only IDDRX1 and ODDRX1 can be used with a single BIDI I/O.
- ▶ If using IDDRX2 and above gearing, this must be used only with an INPUT.
- ▶ If using ODDRX2 and above gearing, this must be used only with an OUTPUT.

**IDDRX2A**

Generic DDR with 2X gearing

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 373: Input Ports**

| Name    | Range | Type    | Active State | Description                                                                |
|---------|-------|---------|--------------|----------------------------------------------------------------------------|
| D       | 1     | Data    | High         | DDR data input                                                             |
| ECLK    | 1     | Clock   | Rising Edge  | Fast edge clock                                                            |
| SCLK    | 1     | Clock   | Rising Edge  | Primary clock input (divide-by-2 of ECLK)                                  |
| RST     | 1     | Control | High         | Reset to DDR registers                                                     |
| ALIGNWD | 1     | Control | High         | This signal is used for word alignment. It will shift the word by one bit. |

**Table 374: Output Ports**

| Name   | Range | Type | Active State | Description                       |
|--------|-------|------|--------------|-----------------------------------|
| Q0, Q2 | 2     | Data | High         | Data at the positive edge of ECLK |
| Q1, Q3 | 2     | Data | High         | Data at the negative edge of ECLK |

**Table 375: Parameters**

| Name | Value                   | Description                   |
|------|-------------------------|-------------------------------|
| GSR  | "ENABLED"<br>"DISABLED" | Enable or disable GSR feature |

**Note**

Avoid using IDDRX2/ODDRX2 and above gearing on a BIDI I/O.

- ▶ Only IDDRX1 and ODDRX1 can be used with a single BIDI I/O.
- ▶ If using IDDRX2 and above gearing, this must be used only with an INPUT.
- ▶ If using ODDRX2 and above gearing, this must be used only with an OUTPUT.

## IDDRX2DQ

DQ Input for DDR2 and DDR3 Memory

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFMXO5
- ▶ LIFCL-40,LIFCL-17
- ▶ UT24C
- ▶ UT24CP

This primitive is used to implement DDR3/DDR3L and LPDDR2/LPDDR3 memory interfaces.

**Table 376: Input Ports**

| Name   | Range | Description                                                         |
|--------|-------|---------------------------------------------------------------------|
| D      | 1     | DDR data input.                                                     |
| DQSR90 | 1     | DQS clock input.                                                    |
| ECLK   | 1     | Fast edge clock.                                                    |
| SCLK   | 1     | Primary clock input (divide-by-2 of ECLK).                          |
| RST    | 1     | Reset to DDR registers.                                             |
| RDPNTR | 2:0   | Read pointer from the DQSBUF module used to transfer data to ECLK.  |
| WRPNTR | 2:0   | Write pointer from the DQSBUF module used to transfer data to ECLK. |

**Table 377: Output Ports**

| Name | Range | Description                                                                                                                                  |
|------|-------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Q    | 3:0   | Parallel data output. Q0 and Q2 are the data at the positive edges of the input ECLK. Q1 and Q3 are the data at negative edge of input ECLK. |

**Table 378: Parameters**

| Name | Values                                     | Description              |
|------|--------------------------------------------|--------------------------|
| GSR  | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable global set/reset. |

## IDDRX4

Generic X4 IDDR

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

This primitive is used for the Generic x4 IDDR implementation.

**Table 379: Input Ports**

| Name | Range | Description                                |
|------|-------|--------------------------------------------|
| D    | 1     | DDR data input.                            |
| SCLK | 1     | Primary clock input (divide-by-4 of ECLK). |

**Table 379: Input Ports**

| Name    | Range | Description                       |
|---------|-------|-----------------------------------|
| RST     | 1     | Reset to DDR registers.           |
| ECLK    | 1     | Fast edge clock.                  |
| ALIGNWD | 1     | Shifts word alignment by one bit. |

**Table 380: Output Ports**

| Name | Range | Description                                                                                                                                       |
|------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Q    | 7:0   | Parallel data output. Q0, Q2, Q4, Q6 are the data at the positive edges of the input ECLK. Q1, Q3, Q5, Q7 are data at negative edge of input ECLK |

**Table 381: Parameters**

| Name | Values                                     | Description              |
|------|--------------------------------------------|--------------------------|
| GSR  | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable global set/reset. |

**Note**

Avoid using IDDRX2/ODDRX2 and above gearing on a BIDI I/O.

- ▶ Only IDDRX1 and ODDRX1 can be used with a single BIDI I/O.
- ▶ If using IDDRX2 and above gearing, this must be used only with an INPUT.
- ▶ If using ODDRX2 and above gearing, this must be used only with an OUTPUT.

**IDDRX4A**

Generic DDR with 4X gearing

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 382: Input Ports**

| Name    | Range | Type    | Active State | Description                                                                |
|---------|-------|---------|--------------|----------------------------------------------------------------------------|
| D       | 1     | Data    | High         | DDR data input                                                             |
| ECLK    | 1     | Clock   | Rising Edge  | Fast edge clock                                                            |
| SCLK    | 1     | Clock   | Rising Edge  | Primary clock input (divide-by-4 of ECLK)                                  |
| RST     | 1     | Control | High         | Reset to DDR registers                                                     |
| ALIGNWD | 1     | Control | High         | This signal is used for word alignment. It will shift the word by one bit. |

**Table 383: Output Ports**

| Name           | Range | Type | Active State | Description                       |
|----------------|-------|------|--------------|-----------------------------------|
| Q0, Q2, Q4, Q6 | 4     | Data | High         | Data at the positive edge of ECLK |
| Q1, Q3, Q5, Q7 | 4     | Data | High         | Data at the negative edge of ECLK |

**Table 384: Parameters**

| Name | Value                   | Description                   |
|------|-------------------------|-------------------------------|
| GSR  | "ENABLED"<br>"DISABLED" | Enable or disable GSR feature |

**Note**

Avoid using IDDRX2/ODDRX2 and above gearing on a BIDI I/O.

- ▶ Only IDDRX1 and ODDRX1 can be used with a single BIDI I/O.
- ▶ If using IDDRX2 and above gearing, this must be used only with an INPUT.
- ▶ If using ODDRX2 and above gearing, this must be used only with an OUTPUT.

**IDDRX4B**

Input for Generic DDR X4 Using 1:8 Gearing

Architectures Supported:

- ▶ LFMXO4

**Table 385: Input Ports**

| Name    | Range | Description                                                                                 |
|---------|-------|---------------------------------------------------------------------------------------------|
| D       | 1     | DDR input from sysIO buffer.                                                                |
| ECLK    | 1     | Clock connected to the high speed edge clock tree.                                          |
| SCLK    | 1     | Clock connected to the system clock.                                                        |
| RST     | 1     | RESET to this block from CIB.                                                               |
| ALIGNWD | 1     | Data alignment signal used for word alignment.<br>Each operation shifts alignment by 1 bit. |

**Table 386: Output Ports**

| Name | Range | Description                                   |
|------|-------|-----------------------------------------------|
| Q0   | 1     | Data available at the same edge of the clock. |
| Q1   | 1     | Data available at the same edge of the clock. |
| Q2   | 1     | Data available at the same edge of the clock. |

**Table 386: Output Ports**

| Name | Range | Description                                   |
|------|-------|-----------------------------------------------|
| Q3   | 1     | Data available at the same edge of the clock. |
| Q4   | 1     | Data available at the same edge of the clock. |
| Q5   | 1     | Data available at the same edge of the clock. |
| Q6   | 1     | Data available at the same edge of the clock. |
| Q7   | 1     | Data available at the same edge of the clock. |

**Table 387: Parameters**

| Name | Values                             | Description                    |
|------|------------------------------------|--------------------------------|
| GSR  | "ENABLED" (default),<br>"DISABLED" | Enable or disable GSR feature. |

**Description**

IDDRX4B is the input for generic DDR X4 using 1:8 gearing. It uses the VPIC\_RX hardware cell. It is used for bottom bank only.

**IDDRX4DQ**

DQ Input for DDR3 memory

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFMXO5
- ▶ LIFCL-40,LIFCL-17
- ▶ UT24C
- ▶ UT24CP

This primitive is used to implement DDR3/DDR3L and LPDDR2/LPDDR3 memory interfaces at higher speeds.

**Table 388: Input Ports**

| Name   | Range | Description                                                         |
|--------|-------|---------------------------------------------------------------------|
| D      | 1     | DDR data input.                                                     |
| DQSR90 | 1     | DQS clock input.                                                    |
| ECLK   | 1     | Fast edge clock.                                                    |
| SCLK   | 1     | Primary clock input (divide-by-4 of ECLK).                          |
| RST    | 1     | Reset to DDR registers.                                             |
| RDPNTR | 2:0   | Read pointer from the DQSBUF module used to transfer data to ECLK.  |
| WRPNTR | 2:0   | Write pointer from the DQSBUF module used to transfer data to ECLK. |

**Table 389: Output Ports**

| Name | Range | Description                                                                                                                                        |
|------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Q    | 7:0   | Parallel data output. Q0, Q2, Q4, Q6 are the data at the positive edges of the input ECLK. Q1, Q3, Q5, Q7 are data at negative edge of input ECLK. |

**Table 390: Parameters**

| Name | Values                                     | Description              |
|------|--------------------------------------------|--------------------------|
| GSR  | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable global set/reset. |

## IDDRX5

Generic X5 IDDR

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T

- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

This primitive is used for the Generic x5 IDDR implementation.

**Table 391: Input Ports**

| Name    | Range | Description                                |
|---------|-------|--------------------------------------------|
| D       | 1     | DDR data input.                            |
| ECLK    | 1     | Fast edge clock.                           |
| SCLK    | 1     | Primary clock input (divide-by-5 of ECLK). |
| RST     | 1     | Reset to DDR registers.                    |
| ALIGNWD | 1     | Shifts word alignment by one bit.          |

**Table 392: Output Ports**

| Name | Range | Description                                                                                                                                                |
|------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Q    | 9:0   | Parallel data output. Q0, Q2, Q4, Q6, Q8 are the data at the positive edges of the input ECLK. Q1, Q3, Q5, Q7, Q9 are data at negative edge of input ECLK. |

**Table 393: Parameters**

| Name | Values                            | Description              |
|------|-----------------------------------|--------------------------|
| GSR  | "ENABLED" (default)<br>"DISABLED" | Enable global set/reset. |

**Note**

Avoid using IDDRX2/ODDRX2 and above gearing on a BIDI I/O.

- ▶ Only IDDRX1 and ODDRX1 can be used with a single BIDI I/O.
- ▶ If using IDDRX2 and above gearing, this must be used only with an INPUT.
- ▶ If using ODDRX2 and above gearing, this must be used only with an OUTPUT.

**IDDRX5A**

Generic DDR with 5X gearing

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 394: Input Ports**

| Name    | Range | Type    | Active State | Description                                                                |
|---------|-------|---------|--------------|----------------------------------------------------------------------------|
| D       | 1     | Data    | High         | DDR data input                                                             |
| ECLK    | 1     | Clock   | Rising Edge  | Fast edge clock                                                            |
| SCLK    | 1     | Clock   | Rising Edge  | Primary clock input (divide-by-5 of ECLK)                                  |
| RST     | 1     | Control | High         | Reset to DDR registers                                                     |
| ALIGNWD | 1     | Control | High         | This signal is used for word alignment. It will shift the word by one bit. |

**Table 395: Output Ports**

| Name                  | Range | Type | Active State | Description                       |
|-----------------------|-------|------|--------------|-----------------------------------|
| Q0, Q2,<br>Q4, Q6, Q8 | 5     | Data | High         | Data at the positive edge of ECLK |
| Q1, Q3,<br>Q5, Q7, Q9 | 5     | Data | High         | Data at the negative edge of ECLK |

**Table 396: Parameters**

| Name | Value                   | Description                   |
|------|-------------------------|-------------------------------|
| GSR  | "ENABLED"<br>"DISABLED" | Enable or disable GSR feature |

**Note**

Avoid using IDDRX2/ODDRX2 and above gearing on a BIDI I/O.

- ▶ Only IDDRX1 and ODDRX1 can be used with a single BIDI I/O.
- ▶ If using IDDRX2 and above gearing, this must be used only with an INPUT.
- ▶ If using ODDRX2 and above gearing, this must be used only with an OUTPUT.

**IDDRX71A**

7:1 LVDS Input Supporting 1:7 Gearing

Architectures Supported:

- ▶ LFMXO4

**Table 397: Input Ports**

| Name    | Range | Description                                                                         |
|---------|-------|-------------------------------------------------------------------------------------|
| D       | 1     | DDR input from sysIO buffer.                                                        |
| ECLK    | 1     | Edge clock.                                                                         |
| SCLK    | 1     | Clock connected to the system clock.                                                |
| RST     | 1     | RESET for this block.                                                               |
| ALIGNWD | 1     | Data alignment signal used for 7:1 LVDS. Each operation shifts alignment by 2 bits. |

**Table 398: Output Ports**

| Name | Range | Description              |
|------|-------|--------------------------|
| Q    | 6:0   | 1:7 LVDS output signals. |

**Table 399: Parameters**

| Name | Values                           | Description                  |
|------|----------------------------------|------------------------------|
| GSR  | "ENABLED" (default),<br>DISABLED | Enable/disable global reset. |

**Description**

IDDRX71A is the 7:1 LVDS input supporting 1:7 gearing. It is used for bottom bank only. IDDRX71A includes the SLIP circuitry.

For more information and usage, refer to the related technical note on the Lattice web site.

**IDDRXE**

Input for Generic DDR X1 Using 1:2 Gearing

Architectures Supported:

- ▶ LFMXO4

**Table 400: Input Ports**

| Name | Range | Description                         |
|------|-------|-------------------------------------|
| D    | 1     | DDR input from sysIO buffer         |
| SCLK | 1     | Clock connected to the system clock |
| RST  | 1     | RESET for this block                |

**Table 401: Output Ports**

| Name | Range | Description                            |
|------|-------|----------------------------------------|
| Q0   | 1     | Data at the positive edge of the clock |
| Q1   | 1     | Data at the negative edge of the clock |

**Table 402: Parameters**

| Name | Values                            | Description             |
|------|-----------------------------------|-------------------------|
| GSR  | "ENABLED" (default)<br>"DISABLED" | Enable global set/reset |

**Description**

IDDRXE is the input for generic DDR X1 using 1:2 gearing. It uses the mPIC (base pic) or PIC (memory pic) hardware cell. It is used for all sides.

For more information and usage, refer to the related technical note on the Lattice web site.

**IDDRX2E**

Input for Generic DDR X2 Using 1:4 Gearing

Architectures Supported:

- ▶ LFMXO4

**Table 403: Input Ports**

| Name    | Range | Description                                                                                   |
|---------|-------|-----------------------------------------------------------------------------------------------|
| D       | 1     | DDR input from sysIO buffer.                                                                  |
| ECLK    | 1     | Clock connected to the high speed edge clock tree.                                            |
| SCLK    | 1     | Clock connected to the system clock.                                                          |
| RST     | 1     | RESET to this block from CIB.                                                                 |
| ALIGNWD | 1     | Data alignment signal used for word alignment. Each operation shifts word alignment by 1 bit. |

**Table 404: Output Ports**

| Name | Range | Description                                   |
|------|-------|-----------------------------------------------|
| Q0   | 1     | Data available at the same edge of the clock. |
| Q1   | 1     | Data available at the same edge of the clock. |
| Q2   | 1     | Data available at the same edge of the clock. |
| Q3   | 1     | Data available at the same edge of the clock. |

**Table 405: Parameters**

| Name | Values                             | Description             |
|------|------------------------------------|-------------------------|
| GSR  | "ENABLED" (default),<br>"DISABLED" | Enable global set/reset |

**Description**

IDDRX2E is the input for generic DDR X2 using 1:4 gearing. It uses the VPIC\_RX hardware cell. It is used for bottom bank only.

For more information and usage, refer to the related technical note on the Lattice web site.

**IFD1P3AZ**

Positive Edge Triggered Input D Flip-Flop with Positive Level Enable

Architectures supported:

- ▶ iCE40 UltraPlus

**Table 406: Input Ports**

| Name | Description               |
|------|---------------------------|
| D    | Data in                   |
| SP   | Clock enable, active high |
| CK   | Clock                     |

**Table 407: Output Ports**

| Name | Description |
|------|-------------|
| Q    | Data out    |

**Table 408: Truth Table**

| Inputs |    |    | Output |
|--------|----|----|--------|
| D      | SP | CK | Q      |
| X      | 0  | X  | Q      |
| 0      | 1  | ↑  | 0      |
| 1      | 1  | ↑  | 1      |

X = Don't care

## IFD1P3BX

Positive Edge Triggered Input D Flip-Flop with Positive Level Enable and Positive Level Asynchronous Preset

Architectures supported:

▶ LAV-AT-ES1

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO4
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ LN2-CT
- ▶ UT24C
- ▶ UT24CP

**Table 409: Input Ports**

| Name | Range | Type    | Active State | Description           |
|------|-------|---------|--------------|-----------------------|
| D    | 1     | Data    | High         | Data Input            |
| CK   | 1     | Clock   | Rising Edge  | Clock Input           |
| SP   | 1     | Control | High         | Positive Clock Enable |
| PD   | 1     | Control | High         | Asynchronous Preset   |

**Table 410: Output Ports**

| Name | Range | Type | Active State | Description |
|------|-------|------|--------------|-------------|
| Q    | 1     |      | High         | Data Output |

**Table 411: Parameters**

| Name | Values                                     | Description                   |
|------|--------------------------------------------|-------------------------------|
| GSR  | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable or disable GSR feature |

**Note:**

Any IO driving an IO register may **only** drive that IO register and nothing else.

**Table 412: Truth Table**

| Inputs |    |    |    | Outputs |
|--------|----|----|----|---------|
| D      | SP | CK | PD | Q       |
| X      | 0  | X  | 0  | Q       |
| X      | X  | X  | 1  | 1       |
| 0      | 1  | ↑  | 0  | 0       |
| 1      | 1  | ↑  | 0  | 1       |

X = Don't Care

When GSR = 0, Q = 1 (D = SP = CK = PD = X)

**IFD1P3DX**

Positive Edge Triggered Input D Flip-Flop with Positive Level Enable and Positive Level Asynchronous Clear

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ LN2-CT
- ▶ UT24C
- ▶ UT24CP

**Table 413: Input Ports**

| Name | Range | Type    | Active State | Description           |
|------|-------|---------|--------------|-----------------------|
| D    | 1     | Data    | High         | Data Input            |
| CK   | 1     | Clock   | Rising Edge  | Clock Input           |
| SP   | 1     | Control | High         | Positive Clock Enable |
| CD   | 1     | Control | High         | Asynchronous Reset    |

**Table 414: Output Ports**

| Name | Range | Type | Active State | Description |
|------|-------|------|--------------|-------------|
| Q    | 1     |      | High         | Data Output |

**Table 415: Parameters**

| Name | Values                                     | Description                   |
|------|--------------------------------------------|-------------------------------|
| GSR  | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable or disable GSR feature |

**Note:**

Any IO driving an IO register may **only** drive that IO register and nothing else.

**Table 416: Truth Table**

| Inputs |    |    |    | Output |
|--------|----|----|----|--------|
| D      | SP | CK | CD | Q      |
| X      | 0  | X  | 0  | Q      |
| X      | X  | X  | 1  | 0      |

**Table 416: Truth Table**

| Inputs |   |   |   | Output |
|--------|---|---|---|--------|
| 0      | 1 | ↑ | 0 | 0      |
| 1      | 1 | ↑ | 0 | 1      |

X = Don't care

When GSR = 0, Q = 0 (D = SP = CK = CD = X)

## IFD1P3IX

Positive Edge Triggered Input D Flip-Flop with Positive Level Synchronous Clear and Positive Level Enable (Clear Overrides Enable)

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ LN2-CT
- ▶ UT24C
- ▶ UT24CP

**Table 417: Input Ports**

| Name | Range | Type    | Active State | Description           |
|------|-------|---------|--------------|-----------------------|
| D    | 1     | Data    | High         | Data Input            |
| CK   | 1     | Clock   | Rising Edge  | Clock Input           |
| SP   | 1     | Control | High         | Positive Clock Enable |
| CD   | 1     | Control | High         | Synchronous Reset     |

**Table 418: Output Ports**

| Name | Range | Type | Active State | Description |
|------|-------|------|--------------|-------------|

|------|--------------------------------------------|-------------------------------|
| GSR  | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable or disable GSR feature |

**Note:**

Any IO driving an IO register may **only** drive that IO register and nothing else.

**Table 424: Truth Table**

| Inputs |    |    |    | Output |
|--------|----|----|----|--------|
| D      | SP | CK | PD | Q      |
| X      | 0  | X  | 0  | Q      |
| X      | X  | ↑  | 1  | 1      |
| 0      | 1  | ↑  | 0  | 0      |
| 1      | 1  | ↑  | 0  | 1      |

When GSR = 0, Q = 1 (D = SP = CK = PD = X)

**IFS1P3BX**

Positive Edge Triggered D Flip-Flop with Positive Level Enable, Positive Level Asynchronous Preset, and System Clock (used in input PIC area only)

Architectures Supported:

- ▶ LFMXO4

**Table 425: Input Ports**

| Name | Range | Description         |
|------|-------|---------------------|
| D    | 1     | Data in             |
| SP   | 1     | Clock enable        |
| SCLK | 1     | Primary clock input |
| PD   | 1     | Preset              |

**Table 426: Output Ports**

| Name | Range | Description |
|------|-------|-------------|
| Q    | 1     | Data Output |

**Table 427: Parameters**

| Name | Values                             | Description                   |
|------|------------------------------------|-------------------------------|
| GSR  | "ENABLED" (default),<br>"DISABLED" | Enable or disable GSR feature |

**Description**

This primitive must be paired with an input or bidirectional buffer. The mapper automatically assigns the primitive and its buffer to the same PIC. Use the PIN or LOC properties, or the LOCATE COMP preference, on the buffer per normal use, but not on this primitive.

**Table 428: Truth Table**

| Inputs |    |      |    | Outputs |
|--------|----|------|----|---------|
| D      | SP | SCLK | PD | Q       |
| X      | 0  | X    | 0  | Q       |
| X      | X  | X    | 1  | 1       |
| 0      | 1  | ↑    | 0  | 0       |

When GSR=0, Q=1 (D=SP=SCLK=PD=X)

## IFS1P3DX

Positive Edge Triggered D Flip-Flop with Positive Level Enable, Positive Level Asynchronous Clear, and System Clock (used in input PIC area only)

Architectures Supported:

▶ LFMXO4

**Table 429: Input Ports**

| Name | Range | Description         |
|------|-------|---------------------|
| D    | 1     | Data in             |
| SP   | 1     | Clock enable        |
| SCLK | 1     | Primary clock input |
| CD   | 1     | Clear               |

**Table 430: Output Ports**

| Name | Range | Description |
|------|-------|-------------|
| Q    | 1     | Data Output |

**Table 431: Parameters**

| Name | Values                             | Description                   |
|------|------------------------------------|-------------------------------|
| GSR  | "ENABLED" (default),<br>"DISABLED" | Enable or disable GSR feature |

## Description

This primitive must be paired with an input or bidirectional buffer. The mapper automatically assigns the primitive and its buffer to the same PIC. Use the PIN or LOC properties, or the LOCATE COMP preference, on the buffer per normal use, but not on this primitive.

**Table 432: Truth Table**

| Inputs |    |      |    | Outputs |
|--------|----|------|----|---------|
| D      | SP | SCLK | CD | Q       |
| X      | 0  | X    | 0  | Q       |
| X      | X  | X    | 1  | 0       |
| 0      | 1  | ↑    | 0  | 0       |

X = Don't care

When GSR=0, Q=0 (D=SP=SCLK=CD=X)

## IFS1P3IX

Positive Edge Triggered D Flip-Flop with Positive Level Synchronous Clear, Positive Level Enable, and System Clock (Clear overrides Enable) (used in input PIC area only)

Architectures Supported:

- ▶ LFMXO4

**Table 433: Input Ports**

| Name | Range | Description         |
|------|-------|---------------------|
| D    | 1     | Data in             |
| SP   | 1     | Clock enable        |
| SCLK | 1     | Primary clock input |
| CD   | 1     | Clear               |

**Table 434: Output Ports**

| Name | Range | Description |
|------|-------|-------------|
| Q    | 1     | Data Output |

**Table 435: Parameters**

| Name | Values                             | Description                   |
|------|------------------------------------|-------------------------------|
| GSR  | "ENABLED" (default),<br>"DISABLED" | Enable or disable GSR feature |

**Description**

This primitive must be paired with an input or bidirectional buffer. The mapper automatically assigns the primitive and its buffer to the same PIC. Use the PIN or LOC properties, or the LOCATE COMP preference, on the buffer per normal use, but not on this primitive.

**Table 436: Truth Table**

| Inputs |    |      |    | Outputs |
|--------|----|------|----|---------|
| D      | SP | SCLK | CD | Q       |
| X      | 0  | X    | 0  | Q       |
| X      | X  | ↑    | 1  | 0       |
| 0      | 1  | ↑    | 0  | 0       |
| 1      | 1  | ↑    | 0  | 1       |

X = Don't care

When GSR=0, Q=0 (D=SP=SCLK=CD=X)

## IFS1P3JX

Positive Edge Triggered D Flip-Flop with Positive Level Synchronous Preset, Positive Level Enable, and System Clock (Preset overrides Enable) (used in input PIC area only)

Architectures Supported:

▶ LFMX04

**Table 437: Input Ports**

| Name | Range | Description         |
|------|-------|---------------------|
| D    | 1     | Data in             |
| SP   | 1     | Clock enable        |
| SCLK | 1     | Primary clock input |
| PD   | 1     | Preset              |

**Table 438: Output Ports**

| Name | Range | Description |
|------|-------|-------------|
| Q    | 1     | Data Output |

**Table 439: Parameters**

| Name | Values                             | Description                   |
|------|------------------------------------|-------------------------------|
| GSR  | "ENABLED" (default),<br>"DISABLED" | Enable or disable GSR feature |

**Description**

This primitive must be paired with an input or bidirectional buffer. The mapper automatically assigns the primitive and its buffer to the same PIC. Use the PIN or LOC properties, or the LOCATE COMP preference, on the buffer per normal use, but not on this primitive.

**Table 440: Truth Table**

| Inputs |    |      |    | Outputs |
|--------|----|------|----|---------|
| D      | SP | SCLK | PD | Q       |
| X      | 0  | X    | 0  | Q       |
| X      | X  | ↑    | 1  | 1       |
| 0      | 1  | ↑    | 0  | 0       |
| 1      | 1  | ↑    | 0  | 1       |

X = Don't care

When GSR=0, Q=1 (D=SP=SCLK=PD=X)

**IMONDELAY**

ECLK interface with dynamically control delay and edge monitor (IMON)

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 441: Input Ports**

| Name      | Range | Type    | Active State | Description                                             |
|-----------|-------|---------|--------------|---------------------------------------------------------|
| A         | 1     | Data    | High         | Data input from pin                                     |
| SCLK      | 1     | Clock   | High         | Primary clock for IREG/IDDR                             |
| ECLK      | 1     | Clock   | Rising Edge  | Fast Edge Clock                                         |
| LSR       | 1     | Reset   | High         | Local Set/Reset                                         |
| LOAD      | 1     | Control | High         |                                                         |
| DIRECTION | 1     | Control | High         | DIRECTION<br>1 to decrease delay<br>0 to increase delay |
| MOVE      | 1     | Control | High         |                                                         |
| SCANLR1   | 1     | Control | High         | Edge Monitor Window Adjustment                          |
| SCANLR0   | 1     | Control | High         | Edge Monitor Window Adjustment                          |

**Table 442: Output Ports**

| Name    | Range | Type | Active State | Description                                                                                        |
|---------|-------|------|--------------|----------------------------------------------------------------------------------------------------|
| Z       | 1     | Data | High         | Delayed data to input register block                                                               |
| CFLAG   | 1     | Flag | High         | Flag indicating the delay counter has reached max (when moving up) or min (when moving down) value |
| NOEQUAL | 1     | Flag | High         | Equal Flag                                                                                         |

**Table 443: Parameters**

| Name       | Values                                        | Description                    |
|------------|-----------------------------------------------|--------------------------------|
| DEL_MODE   | USER_DEFINED<br>ECLK_ALIGNED<br>ECLK_CENTERED | Set delay mode                 |
| DEL_VALUE  | "0" to "511"                                  | Static Delay Value             |
| DEL_ADJUST | "0" to "15"                                   | Static Delay Window Adjustment |

**Note:**

IMONDELAY drives only IDDRX2, IDDRX4, IDDRX5 or IDDR71 components.

**INV**

Inverter

Architectures supported:

- ▶ iCE40 UltraPlus
- ▶ LAV-AT-ES1
- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO4
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ LN2-CT
- ▶
- ▶ UT24C
- ▶ UT24CP

**Table 444: Input Ports**

| Name | Description      |
|------|------------------|
| A    | Function input A |

**Table 445: Output Ports**

| Name | Description                       |
|------|-----------------------------------|
| Z    | Delayed output to the PLL fb port |

## INRDB

Input Reference and Differential Buffer

Architectures Supported:

▶ LFMXO4

**Table 446: Input Ports**

| Name | Range | Description  |
|------|-------|--------------|
| D    | 1     | Data input D |
| E    | 1     | Data input E |

**Table 447: Output Ports**

| Name | Range | Description   |
|------|-------|---------------|
| Q    | 1     | Data output Q |

**Description**

The INRDB primitive is used to support post-PAR simulation of Dynamic Bank Controller. The Dynamic Bank Controller signals to the IO are hardwired and cannot be changed for the simulation, so the INRDB and [LVDSOB](#) primitives are defined to support the simulation.

For more information, refer to the related technical note on the Lattice web site.

**IOL\_B**

Input/Output Registers, for Both Single Data and Double Data Rate

Architectures supported:

- ▶ iCE40 UltraPlus

**Table 448: Input Ports**

| Name   | Description                   |
|--------|-------------------------------|
| PADDI  | Data from pad                 |
| DO1    | Data to pad                   |
| DO0    | Data to pad                   |
| CE     | Clock enable                  |
| IOLTO  | Tri-state enable (active low) |
| HOLD   | Hold DI0 state                |
| INCLK  | Input clock                   |
| OUTCLK | Output clock                  |

**Table 449: Output Ports**

| Name  | Description              |
|-------|--------------------------|
| PADDO | Data to pad              |
| PADDT | Tri-state control to pad |
| DI1   | Data from pad            |
| DI0   | Data from pad            |

**Table 450: Parameters**

| Name    | Values                                                                 | Description                                                                                                                                                       |
|---------|------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LATCHIN | "NONE_REG" (default),<br>"LATCH_REG",<br>"LATCH_BYPASS",<br>"NONE_DDR" | NONE REG = no latch, just register, LATCH_REG = latch DI0 when HOLD is asserted, LATCH_BYPASS = latch non-registered DO0, and NONE DDR = No latch, DDR operation. |
| DDROUT  | "NO" (default),<br>"YES"                                               | Select double data rate output                                                                                                                                    |

## JTAG

JTAG Block for Reveal Debugging Tool

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 451: Input Ports**

| Name  | Description                                                                                                                                                                                                       |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JTDO1 | JTAG Test Data Output one (scans output bus entering JTAG block), for internal logic to control non-disruptive re-configuration through JTAG port, JTAG serial interface to the device.                           |
| JTDO2 | JTAG Test Data Output two                                                                                                                                                                                         |
| SMCLK | Configuration Block Clock                                                                                                                                                                                         |
| TCK   | Test Clock, one of the pins for the Test Access Port (TAP), JTAG serial interface to the device, connected directly from the pad of device TCK pin.<br>Clocks registers and TAP Controller.                       |
| TDI   | Test Data Input, one of the pins for the Test Access Port (TAP), JTAG serial interface to the device, connected directly from the pad of device TDI pin.                                                          |
| TMS   | Test Mode Select, one of the pins for the Test Access Port (TAP), JTAG serial interface to the device, connected directly from the pad of device TMS pin.<br>Controls state machine switching for TAP Controller. |

**Table 452: Output Ports**

| Name | Description                                              |
|------|----------------------------------------------------------|
| JCE1 | JTAG Clock Enable one (BS is to boundary scan ring (L2). |
| JCE2 | JTAG Clock Enable two                                    |

**Table 452: Output Ports (Continued)**

| <b>Name</b> | <b>Description</b>                                                                                                                                                                    |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JRSTN       | JTAG ResetN<br>Active low reset signal. Set low initially and then remains high after initialization.                                                                                 |
| JRTI1       | JTAG Run-Test/Idle one                                                                                                                                                                |
| JRTI2       | JTAG Run-Test/Idle two                                                                                                                                                                |
| JSHIFT      | JTAG Shift.<br>Signal goes high when TAP Controller State is Shift-DR.                                                                                                                |
| JTDI        | JTAG Test Data Input, for internal logic to control non-disruptive re-configuration through JTAG port<br>Signal is coming from TDI input and going into the FPGA fabric.              |
| JUPDATE     | JTAG Update.<br>Signal goes high when TAP controller state is Update-DR.                                                                                                              |
| JTCK        | JTAG Test Clock (connects to TCK), for internal logic to control non-disruptive re-configuration through JTAG port<br>Signal is coming from TCK input and going into the FPGA fabric. |
| TDO_OEN     | TAP Data Output Enable (OE to TDO)                                                                                                                                                    |
| TDO         | Test Data Output, one of the pins for the Test Access Port (TAP), JTAG serial interface to the device, connected directly to the pad of device TDO pin.                               |

| TDO     | 1     | Test Data Output     |
| JTDI    | 1     | JTAG Test Data Input |
| JTCK    | 1     | JTAG Test Clock      |
| JRTI1   | 1     | JTAG Run-Test/Idle 1 |
| JRTI2   | 1     | JTAG Run-Test/Idle 2 |
| JSHIFT  | 1     | JTAG Shift           |
| JRSTN   | 1     | JTAG Reset           |
| JUPDATE | 1     | JTAG Update.         |
| JCE1    | 1     | JTAG Clock Enable 1  |
| JCE2    | 1     | JTAG Clock Enable 2  |

**Table 459: Parameters**

| Name | Values                            | Description   |
|------|-----------------------------------|---------------|
| ER1  | "ENABLED" (default)<br>"DISABLED" | Enable JTAG 1 |
| ER2  | "ENABLED" (default)<br>"DISABLED" | Enable JTAG 2 |

**Description**

The JTAGF primitive is used to provide access to internal JTAG signals from within the FPGA fabric. This is used for some cores, such as REVEAL, and other purposes. It is not a component an ordinary user would normally use directly.

## JTAGH25

Supports hard JTAG operations

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 460: Input Ports**

| Name    | Range | Description                                                                                                                                                                                                       |
|---------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TDI     | 1     | Test Data Input, one of the pins for the Test Access Port (TAP), JTAG serial interface to the device, connected directly from the pad of device TDI pin.                                                          |

|------|-------|-----------------------|
| Z    | 1     | Multiplication result |

## LSOSC

Low-frequency oscillator. Generates 10-kHz nominal clock, +/- 10 percent. Can drive global clock network or fabric routing.

Architectures supported:

- ▶ iCE40 UltraPlus

**Table 468: Input Ports**

| Name    | Description                                                                                      |
|---------|--------------------------------------------------------------------------------------------------|
| CLKLFPU | Power up the oscillator. After power up, output will be stable after 100 $\mu$ s. Active high.   |
| CLKLFEN | Enable the clock output. Enable should be low for the 100- $\mu$ s power-up period. Active high. |

**Table 469: Output Ports**

| Name  | Description       |
|-------|-------------------|
| CLKLF | Oscillator output |

SAME AS: SB\_LFOSC

## LSOSC1P8V

Low-frequency oscillator. Generates 10-kHz nominal clock, +/- 10 percent. Can drive global clock network or fabric routing. For use when VPP\_2V5 is connected to a voltage below 2.3 V.

Architectures supported:

- ▶ iCE40 UltraPlus

**Table 470: Input Ports**

| Name    | Description                                                                                      |
|---------|--------------------------------------------------------------------------------------------------|
| CLKLFPU | Power up the oscillator. After power up, output will be stable after 100 $\mu$ s. Active high.   |
| CLKLFEN | Enable the clock output. Enable should be low for the 100- $\mu$ s power-up period. Active high. |

| FABRIC_TRIME | "DISABLE" (default),<br>"ENABLE" | Trim bits source selection. ENABLE - Trim bits sourced from Fabric, DISABLE - Trim bits sourced from NVCM. |

## LVDSOB

LVDS Output Buffer

Architectures Supported:

- ▶ LFMXO4

**LVDSOB****Table 475: Input Ports**

| Name | Range | Description  |
|------|-------|--------------|
| D    | 1     | Data input D |
| E    | 1     | Data input E |

**Table 476: Output Ports**

| Name | Range | Description   |
|------|-------|---------------|
| Q    | 1     | Data output Q |

**Description**

The LVDSOB primitive is used to support post-PAR simulation of Dynamic Bank Controller. The Dynamic Bank Controller signals to the IO are hardwired and cannot be changed for the simulation, so the LVDSOB and [INRDB](#) primitives are defined to support the simulation.

For more information, refer to the related technical note on the Lattice web site.

**LUT4**

4-Input Look-Up Table

Architectures supported:

- ▶ iCE40 UltraPlus
- ▶ LAV-AT-ES1
- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFMXO4
- ▶ LFMXO5
- ▶ LIFCL
- ▶ LN2-CT
- ▶ UT24C

## ▶ UT24CP

**Table 477: Input Ports**

| Name | Description |
|------|-------------|
| A    | LUT input A |
| B    | LUT input B |
| C    | LUT input C |
| D    | LUT input D |

**Table 478: Output Ports**

**Table 483: Parameters**

| Name                 | Values   | Description |
|----------------------|----------|-------------|
| <a href="#">INIT</a> | "0x0000" | Interface   |

**Description**

LUT5 defines the programmed state of a LUT5 primitive of a Slice. While this primitive is typically targeted by logic synthesis tools, it can also be instantiated in HDL source for intimate control over LUT5 programming. The contents of the look up table are addressed by the 5 input pins to access 1 of 32 locations.

The programming of the LUT5 (that is, the 0 or 1 value of each memory location within the LUT5) is determined by the value assigned with INIT. The value is expressed in hexadecimal code. Highest memory locations are in the most significant hex digit, the lowest in the least significant digit.

For more information on INIT attribute usage, see the [LUT4](#) topic.

**LUT6**

6-Input Look Up Table

Architectures Supported:

- ▶ LFMXO4

**Table 484: Input Ports**

| Name | Range | Description |
|------|-------|-------------|
| A    | 1     | LUT input A |
| B    | 1     | LUT input B |

**Table 486: Parameters**

| Name                 | Values               | Description |
|----------------------|----------------------|-------------|
| <a href="#">INIT</a> | "0x0000000000000000" | Interface   |

**Description**

LUT6 defines the programmed state of a LUT6 primitive of a Slice. While this primitive is typically targeted by logic synthesis tools, it can also be instantiated in HDL source for intimate control over LUT6 programming. The contents of the look up table are addressed by the 6 input pins to access 1 of 64 locations.

The programming of the LUT6 (that is, the 0 or 1 value of each memory location within the LUT6) is determined by the value assigned with INIT. The value is expressed in hexadecimal code. Highest memory locations are in the most significant hex digit, the lowest in the least significant digit.

For more information on INIT attribute usage, see the [LUT4](#) topic.

## LUT7

7-Input Look Up Table

Architectures Supported:

▶ LFMXO4

**Table 487: Input Ports**

| Name | Range | Description |
|------|-------|-------------|
| A    | 1     | LUT input A |
| B    | 1     | LUT input B |
| C    | 1     | LUT input C |
| D    | 1     | LUT input D |

|------|-------|--------------|
| Z    | 1     | LUT output Z |

**Table 489: Parameters**

| Name                 | Values                               | Description |
|----------------------|--------------------------------------|-------------|
| <a href="#">INIT</a> | "0x00000000000000000000000000000000" | Interface   |

### Description

LUT7 defines the programmed state of a LUT7 primitive of a Slice. While this primitive is typically targeted by logic synthesis tools, it can also be instantiated in HDL source for intimate control over LUT7 programming. The contents of the look up table are addressed by the 7 input pins to access 1 of 128 locations.

The programming of the LUT7 (that is, the 0 or 1 value of each memory location within the LUT7) is determined by the value assigned with INIT. The value is expressed in hexadecimal code. Highest memory locations are in the most significant hex digit, the lowest in the least significant digit.

For more information on INIT attribute usage, see the [LUT4](#) topic.

## LUT8

8-Input Look Up Table

Architectures Supported:

▶ LFMXO4

**Table 490: Input Ports**

| Name | Range | Description |
|------|-------|-------------|
| A    | 1     | LUT input A |
| B    | 1     | LUT input B |
| C    | 1     | LUT input C |
| D    | 1     | LUT input D |
| E    | 1     | LUT input E |
| F    | 1     | LUT input F |
| G    | 1     | LUT input G |
| H    | 1     | LUT input H |

| Name | Range | Description  |
|------|-------|--------------|
| Z    | 1     | LUT output Z |

| Name | Values                                                                     | Description |
|------|----------------------------------------------------------------------------|-------------|
| INIT | "0x00000000000000000000<br>0000000000000000000000<br>00000000000000000000" | Interface   |

LUT8 defines the programmed state of a LUT8 primitive of a Slice. While this primitive is typically targeted by logic synthesis tools, it can also be instantiated in HDL source for intimate control over LUT8 programming. The contents of the look up table are addressed by the 8 input pins to access 1 of 256 locations.

DSP block capable of being configured as a multiplier, adder, subtractor, accumulator, multiply-adder, or multiply-subtractor.

▶ iCE40 UltraPlus

| <b>Name</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AHOLD       | Hold A registers Data. Controls data flow into the input register A. Active High. 0 - Update (load) register at next active clock edge. 1 - Hold (retain) current register value, regardless of clock.                                                                                                                                                                                                                                        |
| BHOLD       | Hold B registers Data. Controls data flow into the B input register. Active High. 0 - Update (load) register at next active clock edge. 1 - Hold (retain) current register value, regardless of clock.                                                                                                                                                                                                                                        |
| CHOLD       | Hold C registers Data. Controls data flow into the C input register. Active High. 0 - Update (load) register at next active clock edge. 1 - Hold (retain) current register value, regardless of clock.                                                                                                                                                                                                                                        |
| DHOLD       | Hold D registers Data. Controls data flow into the D input register. Active High. 0 - Update (load) register at next active clock edge. 1 - Hold (retain) current register value, regardless of clock.                                                                                                                                                                                                                                        |
| IRSTTOP     | Reset input to the A and C input registers, and the pipeline registers in the upper half of the multiplier block. Active High.                                                                                                                                                                                                                                                                                                                |
| IRSTBOT     | Reset input to the B and C input registers, and the pipeline registers in the lower half of the multiplier block, and the 32-bit multiplier result pipeline register. Active High.                                                                                                                                                                                                                                                            |
| ORSTTOP     | Reset the high-order bits of the accumulator register ([31:16]). Active High.                                                                                                                                                                                                                                                                                                                                                                 |
| ORSTBOT     | Reset the low-order accumulator register bits ([15:0]). Active High.                                                                                                                                                                                                                                                                                                                                                                          |
| OLOADTOP    | High-order Accumulator Register Accumulate/Load. Controls whether the accumulator register accepts the output of the adder/subtractor or whether the register is loaded with the value from Input C (or Register C, if configured). 0 - Accumulator Register [31:16] loaded with output from adder/subtractor. 1 - Accumulator Register [31:16] loaded with Input C or Register C, depending on primitive parameter value.                    |
| OLOADBOT    | Low-order Accumulator Register Accumulate/Load. Controls whether the low-order accumulator register bits (15:0] accepts the output of the adder/subtractor or whether the register is loaded with the value from Input D (or Register D, if configured). 0 - Accumulator Register [15:0] loaded with output from adder/subtractor. 1 - Accumulator Register [15:0] loaded with Input D or Register D, depending on primitive parameter value. |
| ADDSUBTOP   | High-order Add/Subtract. Controls whether the adder/subtractor adds or subtracts. 0 - Add: $W+X+HCl$ 1 - Subtract: $W-X-HCl$ .                                                                                                                                                                                                                                                                                                                |
| ADDSUBBOT   | Low-order Add/Subtract. Controls whether the adder/subtractor adds or subtracts. 0 - Add: $Y+Z+LCI$ 1 - Subtract: $Y-Z-LCI$ .                                                                                                                                                                                                                                                                                                                 |
| OHOLDTOP    | High-order Accumulator Register Hold. Controls data flow into the high-order ([31:16]) bits of the accumulator. 0 - Update (load) register at next active clock edge. 1 - Hold (retain) current register value, regardless of clock.                                                                                                                                                                                                          |

**Table 493: Input Ports (Continued)**

| Name      | Description                                                                                                                                                                                                                        |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OHOLDBOT  | Low-order Accumulator Register Hold. Controls data flow into the high-order ([15:0]) bits of the accumulator. 0 - Update (load) register at next active clock edge. 1 - Hold (retain) current register value, regardless of clock. |
| CI        | Carry/borrow input from lower logic tile.                                                                                                                                                                                          |
| ACCUMCI   | Cascade carry/borrow input from lower MAC16 block.                                                                                                                                                                                 |
| SIGNEXTIN | Sign extension input from lower MAC16 block.                                                                                                                                                                                       |

**Table 494: Output Ports**

| Name       | Description                                                                        |
|------------|------------------------------------------------------------------------------------|
| O31...O0   | 32-bit MAC16 output.                                                               |
| O[31:0]    | 32-bit result of a 16x16 multiply operation or a 32-bit adder/accumulate function. |
| O[31:16]   | 16-bit result of an 8x8 multiply operation or a 32-bit adder/accumulate function.  |
| O[15:0]    | 16-bit result of an 8x8 multiply operation or a 32-bit adder/accumulate function). |
| CO         | Carry/borrow output to higher logic tile.                                          |
| ACCUMCO    | Cascade carry/borrow output to higher MAC16 block.                                 |
| SIGNEXTOUT | Sign extension output to higher MAC16 block.                                       |

**Table 495: Parameters**

| Name             | Values                   | Description                                                           |
|------------------|--------------------------|-----------------------------------------------------------------------|
| NEG_TRIGGER      | "0'b0" (default), "0'b1" | Controls input clock polarity.                                        |
| A_REG            | "0'b0" (default), "0'b1" | Input A register Control, 0'b1 = registered (C1)                      |
| B_REG            | "0'b0" (default), "0'b1" | Input B register Control, 0'b1 = registered (C2)                      |
| C_REG            | "0'b0" (default), "0'b1" | Input C register Control, 0'b1 = registered (C0)                      |
| D_REG            | "0'b0" (default), "0'b1" | Input D register Control, 0'b1 = registered (C3)                      |
| TOP_8x8_MULT_REG | "0'b0" (default), "0'b1" | Top 8x8 multiplier output register control, 0'b1 = registered (C4)    |
| BOT_8x8_MULT_REG | "0'b0" (default), "0'b1" | Bottom 8x8 multiplier output register control, 0'b1 = registered (C5) |

**Table 495: Parameters (Continued)**

| Name                     | Values                                       | Description                                                                                                                                                                                  |
|--------------------------|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PIPELINE_16x16_MULT_REG1 | "0'b0" (default), "0'b1"                     | 16x16 intermediate register control, 0'b1 = registered (C6)                                                                                                                                  |
| PIPELINE_16x16_MULT_REG2 | "0'b0" (default), "0'b1"                     | 6x16 multiplier pipeline register control, 0'b1 = registered (C7)                                                                                                                            |
| TOPOUTPUT_SELECT         | "0'b00" (default), "0'b01", "0'b10", "0'b11" | Selects top output O[31:16], 0'b00 = top accumulator, 0'b01 = top accumulator (registered), 0'b10 = top mult8x8, 0'b11 = mult16x16 (C8, C9)                                                  |
| TOPADDSUB_LOWERINPUT     | "0'b00" (default), "0'b01", "0'b10", "0'b11" | Selects lower input for the upper adder/subtractor, 0'b00 = input A, 0'b01 = top mult8x8, 0'b10 = mult16x16, 0'b11 = sign extend from lower adder/subtractor (C10, C11)                      |
| TOPADDSUB_UPPERINPUT     | "0'b0" (default), "0'b1"                     | Selects upper input for the upper adder/subtractor, 0'b0 = accumulate, 0'b1 = input C (C12)                                                                                                  |
| TOPADDSUB_CARRYSELECT    | "0'b00" (default), "0'b01", "0'b10", "0'b11" | Carry/borrow input select to upper adder/subtractor, 0'b00 = constant 0, 0'b01 = constant 1, 0'b10 = carry from lower adder/subtractor, 0'b11 = carry from lower adder/subtractor (C13, C14) |
| BOTOUTPUT_SELECT         | "0'b00" (default), "0'b01", "0'b10", "0'b11" | Selects lower output O[15:0], 0'b00 = bottom adder/subtractor, 0'b01 = bottom adder/subtractor (registered), 0'b10 = bottom mult8x8, 0'b11 = mult16x16 (C15, C16)                            |
| BOTADDSUB_LOWERINPUT     | "0'b00" (default), "0'b01", "0'b10", "0'b11" | Selects lower input for the lower adder/subtractor, 0'b00 = input B, 0'b01 = bottom mult8x8, 0'b10 = mult16x16, 0'b11 = sign extend from previous MAC16 (C17, C18)                           |
| BOTADDSUB_UPPERINPUT     | "0'b0" (default), "0'b1"                     | Selects upper input for the lower adder/subtractor, 0'b0 = accumulate, 0'b1 = input C (C19)                                                                                                  |
| BOTADDSUB_CARRYSELECT    | "0'b00" (default), "0'b01", "0'b10", "0'b11" | Carry/borrow input select to lower adder/subtractor, 0'b00 = constant 0, 0'b01 = constant 1, 0'b10 = ACCUMCI, 0'b11 = CI (C20, C21)                                                          |
| MODE_8x8                 | "0'b0" (default), "0'b1"                     | Selects 8x8 Multiplier mode and 8x8 Low-Power Multiplier Blocking Option, 0'b1 = 8x8 mode (C22)                                                                                              |
| A_SIGNED                 | "0'b0" (default), "0'b1"                     | Indicates whether multiplier input A is signed or unsigned, 0'b1 = signed                                                                                                                    |
| B_SIGNED                 | "0'b0" (default), "0'b1"                     | Indicates whether multiplier input B is signed or unsigned. 0'b1 = signed                                                                                                                    |

**Note:**

SAME AS: SB\_MAC16

**Rules & Restrictions:**

As noted by pin description, ACCUMCO and SIGNEXTIN can only come from previous MAC16's ACCUMCO and SIGNEXTOUT.

Failure to do so will cause connectivity DRC error.

If MODE\_8x8 is 1, then PIPELINE\_16x16\_MULT\_REG1 and PIPELINE\_16x16\_MULT\_REG2 must be 0'b0.

**Note:**

If the operation is 8x8, then these PIPELINE attributes are irrelevant. However, we have to be strict because we don't know the intended use of the DSP. If operation is truly 16x16, then this illegal combination setting would cause an incorrect operation.

Soft MIPI Interface Block

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 496: Input Ports**

| Name   | Range | Description                                             |
|--------|-------|---------------------------------------------------------|
| AP     | 1     | LP Data for P-port                                      |
| AN     | 1     | LP Data for N-port                                      |
| TP     | 1     | LP Tri-sate control for P-port                          |
| TN     | 1     | LP Tri-sate control for N-por                           |
| HSRXEN | 1     | HSRXEN for MIPI RX: 0 disable; 1 enable                 |
| HSTXEN | 1     | HSTXEN for MIPI TX to support BIDI: 0 disable, 1 enable |
| IHS    | 1     | Internal Horizontal Sync                                |

**Table 497: Output Ports**

| Name | Range | Description                      |
|------|-------|----------------------------------|
| OLSP | 1     | Low Power MIPI output for P-port |
| OLSN | 1     | Low Power MIPI output for N-port |
| OHS  | 1     | High Speed output                |

**Table 498: Bidirectional Ports**

| Name | Range | Description      |
|------|-------|------------------|
| BP   | 1     | IOPAD for P-por  |
| BN   | 1     | IOPAD for N-port |

**Table 499: Parameters**

| Name    | Values      | Description                                                                                           |
|---------|-------------|-------------------------------------------------------------------------------------------------------|
| MIPI_ID | 0 (default) | The MIPI_ID is used to place 2 PIO in a pair of PIO.<br>0 is not used for MIPI<br>>0 is for MIPI pair |

## MIPIA

Soft version of bidirectional MIPI

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 500: Input Ports**

| Name   | Range | Type    | Description                                             |
|--------|-------|---------|---------------------------------------------------------|
| BP     | 1     | Data    | IOPAD for P-port                                        |
| BN     | 1     | Data    | IOPAD for N-port                                        |
| AP     | 1     | Data    | LP Data for P-port                                      |
| AN     | 1     | Data    | LP Data for N-port                                      |
| TP     | 1     | Control | LP Tri-sate control for P-port                          |
| TN     | 1     | Control | LP Tri-sate control for N-port                          |
| HSRXEN | 1     | Control | HSRXEN for MIPI RX: 0 disable; 1 enable                 |
| HSTXEN | 1     | Control | HSTXEN for MIPI TX to support BIDI: 0 disable, 1 enable |
| IHS    | 1     | Data    | Internal Horizontal Sync                                |

**Table 501: Output Ports**

| Name | Range | Type  | Description                      |
|------|-------|-------|----------------------------------|
| OLSP | 1     | Clock | Low Power MIPI output for P-port |
| OLSN | 1     | Clock | Low Power MIPI output for N-port |
| OHS  | 1     | Clock | High Speed output                |

**Table 502: Parameters**

| Name    | Values                       | Description                                                                                           |
|---------|------------------------------|-------------------------------------------------------------------------------------------------------|
| MIPI_ID | "0" (default)<br>Any integer | The MIPI_ID is used to place 2 PIO in a pair of PIO.<br>0 is not used for MIPI<br>>0 is for MIPI pair |

## MULT18X18

18x18 Multiplier with Optional Input/Output Registers

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 503: Input Ports**

| Name    | Range | Description           |
|---------|-------|-----------------------|
| A       | 17:0  | Operand A             |
| B       | 17:0  | Operand B             |
| CLK     | 1     | Clock                 |
| CEA     | 1     | Input A enable        |
| RSTA    | 1     | Input A reset         |
| CEB     | 1     | Input clock enable    |
| RSTB    | 1     | Input register reset  |
| SIGNEDA | 1     | Operand A signed      |
| SIGNEDB | 1     | Operand B signed      |
| RSTOUT  | 1     | Output register reset |
| CEOUT   | 1     | Output clock enable   |

**Table 504: Output Ports**

| Name | Range | Description           |
|------|-------|-----------------------|
| Z    | 35:0  | Multiplication result |

**Table 505: Parameters**

| Name      | Values                            | Description             |
|-----------|-----------------------------------|-------------------------|
| REGINPUTA | "REGISTER" (default)<br>"BYPASS"  | Register operand A      |
| REGINPUTB | "REGISTER" (default)<br>"BYPASS"  | Register operand B      |
| REGOUTPUT | "REGISTER" (default)<br>"BYPASS"  | Register output         |
| GSR       | "ENABLED" (default)<br>"DISABLED" | Enable global set/reset |
| RESETMODE | "SYNC" (default)                  | Reset type              |

**Note:**

Implements  $Z[35:0] = A[17:0] \times B[17:0]$ .

## MULT18X18A

18x18 Multiplier with Optional Input/Output Registers

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 506: Input Ports**

| Name  | Range | Type         | Description                         |
|-------|-------|--------------|-------------------------------------|
| A     | 17:0  | Data         | Operand A                           |
| B     | 17:0  | Data         | Operand B                           |
| CLK   | 1     | Clock        | Clock                               |
| RST   | 1     | Reset        | Synchronous reset for all registers |
| CEA   | 1     | Clock Enable | Input A register clock enable       |
| CEB   | 1     | Clock Enable | Input B register clock enable       |
| CEOUT | 1     | Clock Enable | Output register clock enable        |

**Table 507: Output Ports**

| Name | Range | Type    | Description           |
|------|-------|---------|-----------------------|
| Z    | 35:0  | Control | Multiplication result |

**Table 508: Parameters**

| Name      | Values                               | Description                            |
|-----------|--------------------------------------|----------------------------------------|
| REGINPUTA | "REGISTERED" (default)<br>"BYPASSED" | Register operand A                     |
| REGINPUTB | "REGISTERED" (default)<br>"BYPASSED" | Register operand B                     |
| REGOUTPUT | "REGISTERED" (default)<br>"BYPASSED" | Register output                        |
| RESETMODE | "SYNC" (default)<br>"ASYNC"          | Synchronous/asynchronous reset control |
| GSR       | "DISABLED" (default)<br>"ENABLED"    | Enable global set/reset                |

**Note:**

Implements the function  $Z[35:0] = A[17:0] * B[17:0]$

**MULT18X36**

18x36 Multiplier with Optional Input/Output Register

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 509: Input Ports**

| Name    | Range | Description           |
|---------|-------|-----------------------|
| A       | 17:0  | Operand A             |
| B       | 35:0  | Operand B             |
| CLK     | 1     | Clock                 |
| CEA     | 1     | Input clock enable    |
| RSTA    | 1     | Input register reset  |
| CEB     | 1     | Input clock enable    |
| RSTB    | 1     | Input register reset  |
| SIGNEDA | 1     | Operand A signed      |
| SIGNEDB | 1     | Operand B signed      |
| RSTOUT  | 1     | Output register reset |
| CEOUT   | 1     | Output clock enable   |

**Table 510: Output Ports**

| Name | Range | Description           |
|------|-------|-----------------------|
| Z    | 53:0  | Multiplication result |

**Table 511: Parameters**

| Name      | Values                            | Description             |
|-----------|-----------------------------------|-------------------------|
| REGINPUTA | "REGISTER" (default)<br>"BYPASS"  | Register operand A      |
| REGINPUTB | "REGISTER" (default)<br>"BYPASS"  | Register operand B      |
| REGOUTPUT | "REGISTER" (default)<br>"BYPASS"  | Register output         |
| GSR       | "ENABLED" (default)<br>"DISABLED" | Enable global set/reset |
| RESETMODE | "SYNC" (default)                  | Reset type              |

**Note:**

Implements  $Z[53:0] = A[17:0] \times B[35:0]$ .

**MULT36X36**

36x36 Multiplier with Optional Input/Output Registers

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5

- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 512: Input Ports**

| Name    | Range | Description            |
|---------|-------|------------------------|
| A       | 35:0  | Operand A              |
| B       | 35:0  | Operand B              |
| CLK     | 1     | Clock                  |
| CEA     | 1     | Input A clock enable   |
| RSTA    | 1     | Input A register reset |
| CEB     | 1     | Input B clock enable   |
| RSTB    | 1     | Input B register reset |
| SIGNEDA | 1     | Operand A signed       |
| SIGNEDB | 1     | Operand B signed       |
| RSTOUT  | 1     | Output register reset  |
| CEOUT   | 1     | Output clock enable    |

**Table 513: Output Ports**

| Name | Range | Description           |
|------|-------|-----------------------|
| Z    | 71:0  | Multiplication result |

**Table 514: Parameters**

| Name      | Values                            | Description             |
|-----------|-----------------------------------|-------------------------|
| REGINPUTA | "REGISTER" (default)<br>"BYPASS"  | Register operand A      |
| REGINPUTB | "REGISTER" (default)<br>"BYPASS"  | Register operand B      |
| REGOUTPUT | "REGISTER" (default)<br>"BYPASS"  | Register output         |
| GSR       | "ENABLED" (default)<br>"DISABLED" | Enable global set/reset |
| RESETMODE | "SYNC" (default)                  | Reset type              |

**Note:**

Implements  $Z[71:0] = A[35:0] \times B[35:0]$ .

**MULT8X8**

8x8 Multiplier with Optional Input/Output Registers

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 515: Input Ports**

| Name  | Range | Type         | Description                         |
|-------|-------|--------------|-------------------------------------|
| A     | 7:0   | Data         | Operand A                           |
| B     | 7:0   | Data         | Operand B                           |
| CLK   | 1     | Clock        | Clock                               |
| RST   | 1     | Reset        | Synchronous reset for all registers |
| CEA   | 1     | Clock Enable | Input A register clock enable       |
| CEB   | 1     | Clock Enable | Input B register clock enable       |
| CEOUT | 1     | Clock Enable | Output register clock enable        |

**Table 516: Output Ports**

| Name | Range | Type    | Description           |
|------|-------|---------|-----------------------|
| Z    | 15:0  | Control | Multiplication result |

**Table 517: Parameters**

| SATURATION_BITS | "48" (default)<br>"3-48"                          | Saturation bits                                                              |
| GSR             | "DISABLED" (default)<br>"ENABLED"                 | Enable global set/reset                                                      |

**Note:**

When the pre-adder and accumulator are both enabled, it implements the function:

$$M\_INT = A * (B +/- C)$$

$$Z\_out = CAS\_INT + C\_INT + CIN\_INT +/- M\_INT$$

Note that the pre-adder and accumulator share the C input. If the pre-adder is used, typically ACCUM\_C\_EN should be set to DISABLED so the accumulator ignores the value of the C port.

When the pre-adder is enabled and the accumulator is disabled, it implements the function:

$$Z\_out = A * (B +/- C)$$

When the pre-adder is disabled and the accumulator is enabled, it implements the function:

$$M\_int = A * B$$

$$Z\_out = CAS\_INT + C\_INT + CIN\_INT +/- M\_INT$$

See the diagram below for the internal node corresponding to the above terms.

Although not shown in the diagram below, the register for accumulator inputs CIN, CAS\_ZIN\_EN, SELCAS\_ZIN, and ADDSUBACCUM is bypassable with the parameter REGACCUMCONTROLS.

| RSTOUT   | 1     | Output register reset                        |
| CEOUT    | 1     | Output clock enable                          |
| LOADC    | 1     | Load value from input C (active high)        |
| ADDSUB   | 1:0   | Two bits ADD/SUB control (0=add, 1=subtract) |

**Table 531: Output Ports**

| Name | Range | Description           |
|------|-------|-----------------------|
| Z    | 53:0  | Multiplication result |

**Table 532: Parameters**

| Name        | Values                                     | Description                                 |
|-------------|--------------------------------------------|---------------------------------------------|
| REGINPUTAB0 | "REGISTER" (default)<br>"BYPASS"           | Register operand A/B 0                      |
| REGINPUTAB1 | "REGISTER" (default)<br>"BYPASS"           | Register operand A/B 1                      |
| REGINPUTC   | "REGISTER" (default)<br>"BYPASS"           | Register operand C                          |
| REGADDSUB   | "REGISTER" (default)<br>"BYPASS"           | Register ADDSUB                             |
| REGLOADC    | "REGISTER" (default)<br>"BYPASS"           | Register LOADC                              |
| REGLOADC2   | "REGISTER" (default)<br>"BYPASS"           | Register LOADC, second stage                |
| REGPIPELINE | "REGISTER" (default)<br>"BYPASS"           | Register between multiplier and accumulator |
| REGOUTPUT   | "REGISTER" (default)<br>"BYPASS"           | Register output                             |
| GSR         | "DISABLED" ( <i>default</i> )<br>"ENABLED" | Enable global set/reset                     |
| RESETMODE   | "SYNC" (default)                           | Synchronous/<br>asynchronous reset control  |

**Note:**

If LOADC = 1:

$$Z[53:0] = C[53:0] \text{ +/- } (A0[17:0] \times B0[17:0]) \text{ +/- } (A1[17:0] * B1[17:0])$$

$$\text{Else: } Z[53:0] = Z_{\text{prev}}[53:0] \text{ +/- } (A0[17:0] \times B0[17:0]) \text{ +/- } (A1[17:0] * B1[17:0])$$

If LOADC = 0, REGOUTPUT must be REGISTERED. Else, will result into a combinatorial lock.

ADDSUB[1] controls add/sub between C/Zprev and A0B0.

ADDSUB[0] controls add/sub between A0B0 and A1B1.

| REGINPUTAB2 | "REGISTER" (default)<br>"BYPASS"  | Register operand A/B 2                                                        |
| REGINPUTAB3 | "REGISTER" (default)<br>"BYPASS"  | Register operand A/B 3                                                        |
| REGINPUTC   | "REGISTER" (default)<br>"BYPASS"  | Register operand C                                                            |
| REGADDSUB   | "REGISTER" (default)<br>"BYPASS"  | Register ADDSUB                                                               |
| REGLOADC    | "REGISTER" (default)<br>"BYPASS"  | Register LOADC                                                                |
| REGLOADC2   | "REGISTER" (default)<br>"BYPASS"  | Register LOADC, Second stage                                                  |
| REGPIPELINE | "REGISTER" (default)<br>"BYPASS"  | Register between multiplier and accumulator                                   |
| REGOUTPUT   | "REGISTER" (default)<br>"BYPASS"  | Register output                                                               |
| GSR         | "ENABLED" (default)<br>"DISABLED" | Enable global set/reset                                                       |
| RESETMODE   | "SYNC" (default)<br>"ASYNC"       | Synchronous/asynchronous reset control. Reset release is always asynchronous. |

**Note:**

If LOADC = 1:

$$Z[53:0] = C[53:0] +/- ( ((A0[8:0] * B0[8:0]) +/- (A1[8:0] * B1[8:0])) \\ +/- ((A2[8:0] * B2[8:0]) +/- (A3[8:0] * B3[8:0])) )$$

If LOADC = 0:

$$Z[53:0] = Z_{prev}[53:0] +/- ( ((A0[8:0] * B0[8:0]) +/- (A1[8:0] * B1[8:0])) \\ +/- ((A2[8:0] * B2[8:0]) +/- (A3[8:0] * B3[8:0])) )$$

If LOADC = 0: REGOUTPUT must be **registered**; otherwise, it will result in a combinatorial lock.

Bits ADDSUB[3:0] controls the 'addition' or 'subtraction' options:

ADDSUB[3]: controls selection of addition/subtraction between A2B2 and A3B3

ADDSUB[2]: controls selection of addition/subtraction between A0B1 and A1B1

ADDSUB[1]: controls selection of addition/subtraction between C/Z<sub>prev</sub> and (A0B0 +/- A1B1)

ADDSUB[0]: controls selection of addition/subtraction between (A0B0 +/- A1B1) and (A2B2 +/- A3B3)

## MULTIBOOT

Wrapper for Interface for Multiboot Functionality

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C

## ▶ UT24CP

### MULTIBOOT

**Table 542: Input Ports**

| Name       | Range | Description                  |
|------------|-------|------------------------------|
| AUTOREBOOT | 1     | Automatic Reboot Enable      |
| MSPIMADDR  | 31:0  | Multiboot SPI Memory Address |

**Table 543: Parameters**

| Name      | Values                                                 | Description   |
|-----------|--------------------------------------------------------|---------------|
| MSPIADDR  | 0'b00000000000000000000000000000000 ( <i>default</i> ) | MSPI Address  |
| SOURCESEL | "DIS" ( <i>default</i> )<br>"EN"                       | Source Select |

## MULTPREADD18X18

18x18 Multiplier with Pre-Adder

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**MULTPREADD18X18****Table 544: Input Ports**

| Name    | Range | Description           |
|---------|-------|-----------------------|
| A       | 17:0  | Operand A             |
| B       | 17:0  | Operand B             |
| C       | 17:0  | Operand C             |
| CLK     | 1     | Clock                 |
| CEA     | 1     | Input clock enable    |
| RSTA    | 1     | Input register reset  |
| CEB     | 1     | Input clock enable    |
| RSTB    | 1     | Input register reset  |
| CEC     | 1     | Input clock enable    |
| RSTC    | 1     | Input register reset  |
| SIGNEDA | 1     | Operand A signed      |
| SIGNEDB | 1     | Operand B signed      |
| SIGNEDC | 1     | Operand C signed      |

| X      | 1 | Z      |
| 0      | 0 | 0      |
| 1      | 0 | 1      |

X = Don't care

## OBZ\_B

Output Buffer with Tri-state

Architectures supported:

▶ iCE40 UltraPlus

**Table 569: Input Ports**

| Name | Description                                            |
|------|--------------------------------------------------------|
| I    | Data from fabric                                       |
| T_N  | Tri-state control, active low<br>meaning T_N=0 > O = Z |

**Table 570: Output Ports**

| Name | Description |
|------|-------------|
| O    | Data to pad |

**Table 571: Truth Table**

| Inputs |     | Output |
|--------|-----|--------|
| I      | T_N | O      |
| X      | 0   | Z      |
| 0      | 1   | 0      |
| 1      | 1   | 1      |

X = Don't care

## ODDR71

7:1 LVDS ODDR

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

This primitive is used for 7:1 LVDS ODDR implementation.

**Table 572: Input Ports**

| Name | Range | Description                                                        |
|------|-------|--------------------------------------------------------------------|
| D    | 6:0   | Parallel data input to the ODDR. D0 is sent out first and D6 last. |
| ECLK | 1     | Fast edge clock                                                    |
| SCLK | 1     | Primary clock input (divide-by-3.5 of ECLK).                       |
| RST  | 1     | Reset to DDR registers.                                            |

**Table 573: Output Ports**

| Name | Range | Description                            |
|------|-------|----------------------------------------|
| Q    | 1     | DDR data output on both edges of ECLK. |

**Table 574: Parameters**

| Name | Values                                     | Description              |
|------|--------------------------------------------|--------------------------|
| GSR  | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable global set/reset. |

**Note**

Avoid using IDDRX2/ODDRX2 and above gearing on a BIDI I/O.

- ▶ Only IDDRX1 and ODDRX1 can be used with a single BIDI I/O.
- ▶ If using IDDRX2 and above gearing, this must be used only with an INPUT.
- ▶ If using ODDRX2 and above gearing, this must be used only with an OUTPUT.

**ODDR71A**

7:1 LVDS ODDR implementation

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 575: Input Ports**

| Name | Range | Type    | Active State | Description                               |
|------|-------|---------|--------------|-------------------------------------------|
| D0   | 1     | Data    | High         | DDR data input                            |
| D1   | 1     | Data    | High         | DDR data input                            |

| GSR  | "ENABLED"<br>"DISABLED" | Enable or disable GSR feature |

**Note**

Avoid using IDDRX2/ODDRX2 and above gearing on a BIDI I/O.

- ▶ Only IDDRX1 and ODDRX1 can be used with a single BIDI I/O.
- ▶ If using IDDRX2 and above gearing, this must be used only with an INPUT.
- ▶ If using ODDRX2 and above gearing, this must be used only with an OUTPUT.

**ODDRXE**

Output for Generic DDR X1 Using 2:1 Gearing

Architectures Supported:

- ▶ LFMXO4

**Table 578: Input Ports**

| Name | Range | Description                                 |
|------|-------|---------------------------------------------|
| D0   | 1     | Data A primary phase of data (first out)    |
| D1   | 1     | Data B secondary phase of data (second out) |
| SCLK | 1     | Clock from the CIB                          |
| RST  | 1     | RESET to this block from the CIB            |

**Table 579: Output Ports**

| Name | Range | Description     |
|------|-------|-----------------|
| Q    | 1     | DDR output data |

**Table 580: Parameters**

| Name | Values                           | Description                  |
|------|----------------------------------|------------------------------|
| GSR  | "ENABLE" (default)<br>"DISABLED" | Enable/disable global reset. |

**Description**

ODDRXE is the output for generic DDR X1 using 2:1 gearing. It uses the mPIC or PIC hardware cell. It is used for all sides.

For more information and usage, refer to related technical notes on the Lattice web site.

**ODDRX1**

Generic X1 ODDR

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

This primitive is used to generate the address, command, and control except for CS\_N for DDR3/DDR3L memory interfaces using X2 gearing.

**Table 581: Input Ports**

| Name   | Description                                                 |
|--------|-------------------------------------------------------------|
| D0, D1 | Parallel data input to ODDR. D0 is sent out first, then D1. |
| SCLK   | Primary clock input.                                        |
| RST    | Reset to DDR registers.                                     |

**Table 582: Output Ports**

| Name | Values                  | Description                   |
|------|-------------------------|-------------------------------|
| GSR  | "ENABLED"<br>"DISABLED" | Enable or disable GSR feature |

## ODDRX2

Generic X2 ODDR

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL

- ▶ UT24C
- ▶ UT24CP

This primitive is used to generate the address, command, and control except for CS\_N for DDR3/DDR3L memory interfaces using X4 gearing.

**Table 587: Input Ports**

| Name | Range | Description                                                        |
|------|-------|--------------------------------------------------------------------|
| D    | 3:0   | Parallel data input to the ODDR. D0 is sent out first and D3 last. |
| ECLK | 1     | Fast edge clock.                                                   |
| SCLK | 1     | Primary clock input (divide-by-2 of ECLK).                         |
| RST  | 1     | Reset to DDR registers.                                            |

**Table 588: Output Ports**

| Name | Range | Description                            |
|------|-------|----------------------------------------|
| Q    | 1     | DDR data output on both edges of ECLK. |

**Table 589: Parameters**

| Name | Values                                     | Description              |
|------|--------------------------------------------|--------------------------|
| GSR  | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable global set/reset. |

**Note**

Avoid using IDDRX2/ODDRX2 and above gearing on a BIDI I/O.

- ▶ Only IDDRX1 and ODDRX1 can be used with a single BIDI I/O.
- ▶ If using IDDRX2 and above gearing, this must be used only with an INPUT.
- ▶ If using ODDRX2 and above gearing, this must be used only with an OUTPUT.

**ODDRX2A**

Generic x2 ODDR implementation

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 590: Input Ports**

| Name | Range | Type    | Active State | Description                               |
|------|-------|---------|--------------|-------------------------------------------|
| D0   | 1     | Data    | High         | DDR data input                            |
| D1   | 1     | Data    | High         | DDR data input                            |
| D2   | 1     | Data    | High         | DDR data input                            |
| D3   | 1     | Data    | High         | DDR data input                            |
| ECLK | 1     | Clock   | Rising Edge  | Fast edge clock                           |
| SCLK | 1     | Clock   | Rising Edge  | Primary clock input (divide-by-2 of ECLK) |
| RST  | 1     | Control | High         | Reset to DDR registers                    |

**Table 591: Output Ports**

| Name | Range | Type | Active State | Description                                                            |
|------|-------|------|--------------|------------------------------------------------------------------------|
| Q    | 1     | Data | High         | DDR data output on both edges of SCLK<br>D0, D2: Positive edge of ECLK |

**Table 592: Parameters**

| Name | Values                  | Description                   |
|------|-------------------------|-------------------------------|
| GSR  | "ENABLED"<br>"DISABLED" | Enable or disable GSR feature |

**Note**

Avoid using IDDRX2/ODDRX2 and above gearing on a BIDI I/O.

- ▶ Only IDDRX1 and ODDRX1 can be used with a single BIDI I/O.
- ▶ If using IDDRX2 and above gearing, this must be used only with an INPUT.
- ▶ If using ODDRX2 and above gearing, this must be used only with an OUTPUT.

**ODDRX2E**

Output for Generic DDR X2 Using 4:1 Gearing

Architectures Supported:

- ▶ LFMXO4

**Table 593: Input Ports**

| Name | Range | Description                        |
|------|-------|------------------------------------|
| D0   | 1     | Data at the same edge of the clock |
| D1   | 1     | Data at the same edge of the clock |
| D2   | 1     | Data at the same edge of the clock |
| D3   | 1     | Data at the same edge of the clock |
| ECLK | 1     | Edge clock                         |
| SCLK | 1     | Clock from the CIB                 |
| RST  | 1     | RESET to this block from the CIB   |

**Table 594: Output Ports**

| Name | Range | Description     |
|------|-------|-----------------|
| Q    | 1     | DDR output data |

**Table 595: Parameters**

| Name | Values                            | Description                   |
|------|-----------------------------------|-------------------------------|
| GSR  | "ENABLED" (default)<br>"DISABLED" | Enable or disable GSR feature |

**Description**

ODDRX2E is the output for generic DDR X2 using 4:1 gearing. It uses the VPIC\_TX hardware cell. It is used for top bank only. For more information and usage, refer to related technical notes on the Lattice web site.

**ODDRX2DQ**

DQ output for DDR2 & DDR3 memory

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFMXO5
- ▶ LIFCL-40,LIFCL-17
- ▶ UT24C
- ▶ UT24CP

This primitive is used to generate the DQ data output for DDR3/DDR3L and LPDDR2/LPDDR3 memory interfaces. It is also used to generate the CA bus for LPDDR2/LPDDR3 interfaces.

**Table 596: Input Ports**

| Name    | Range | Description                                                       |
|---------|-------|-------------------------------------------------------------------|
| D       | 3:0   | Data input to the ODDR. D0 is output first, D3 last.              |
| DQSW270 | 1     | Clock that is 90° ahead of clock used to generate the DQS output. |
| ECLK    | 1     | Fast edge clock.                                                  |
| SCLK    | 1     | Primary clock input (divide-by-2 of ECLK).                        |
| RST     | 1     | Reset to DDR registers.                                           |

**Table 597: Output Ports**

| Name | Range | Description                              |
|------|-------|------------------------------------------|
| Q    | 1     | DDR data output on both edges of DQSW270 |

**Table 598: Parameters**

| Name | Values                                     | Description              |
|------|--------------------------------------------|--------------------------|
| GSR  | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable global set/reset. |

## ODDRX2DQS

DQS Output for DDR2 & DDR3 memory

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFMXO5
- ▶ LIFCL-40,LIFCL-17
- ▶ UT24C
- ▶ UT24CP

This primitive is used to generate the DQS data output for DDR3/DDR3L and LPDDR2/LPDDR3 memory interfaces. It is also used to generate CK and control signals (CKE, CS\_N, ODT) for LPDDR2/LPDDR3 memory interfaces in X2 gearing mode.

**Table 599: Input Ports**

| Name | Range | Description                                          |
|------|-------|------------------------------------------------------|
| D    | 3:0   | Data input to the ODDR. D0 is output first, D3 last. |
| DQSW | 1     | DQSW includes write leveling phase shift from ECLK.  |
| ECLK | 1     | Fast edge clock.                                     |
| SCLK | 1     | Primary clock input (divide-by-2 of ECLK).           |
| RST  | 1     | Reset to DDR registers.                              |

**Table 600: Output Ports**

| Name | Range | Description                            |
|------|-------|----------------------------------------|
| Q    | 1     | DDR data output on both edges of DQSW. |

**Table 601: Parameters**

| Name | Values                                     | Description              |
|------|--------------------------------------------|--------------------------|
| GSR  | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable global set/reset. |

## ODDRX4

Generic X4 ODDR

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

This primitive is used for Generic x4 ODDR implementation.

**Table 602: Input Ports**

| Name | Range | Description                                                        |
|------|-------|--------------------------------------------------------------------|
| D    | 7:0   | Parallel data input to the ODDR. D0 is sent out first and D7 last. |
| ECLK | 1     | Fast edge clock.                                                   |
| SCLK | 1     | Primary clock input (divide-by-4 of ECLK).                         |
| RST  | 1     | Reset to DDR registers.                                            |

**Table 603: Output Ports**

| Name | Range | Description                            |
|------|-------|----------------------------------------|
| Q    | 1     | DDR data output on both edges of ECLK. |

**Table 604: Parameters**

| Name | Values                                     | Description              |
|------|--------------------------------------------|--------------------------|
| GSR  | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable global set/reset. |

#### Note

Avoid using IDDRX2/ODDRX2 and above gearing on a BIDI I/O.

- ▶ Only IDDRX1 and ODDRX1 can be used with a single BIDI I/O.
- ▶ If using IDDRX2 and above gearing, this must be used only with an INPUT.
- ▶ If using ODDRX2 and above gearing, this must be used only with an OUTPUT.

## ODDRX4A

Generic x4 ODDR implementation

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 605: Input Ports**

| Name | Range | Type    | Active State | Description                               |
|------|-------|---------|--------------|-------------------------------------------|
| D0   | 1     | Data    | High         | DDR data input                            |
| D1   | 1     | Data    | High         | DDR data input                            |
| D2   | 1     | Data    | High         | DDR data input                            |
| D3   | 1     | Data    | High         | DDR data input                            |
| D4   | 1     | Data    | High         | DDR data input                            |
| D5   | 1     | Data    | High         | DDR data input                            |
| D6   | 1     | Data    | High         | DDR data input                            |
| D7   | 1     | Data    | High         | DDR data input                            |
| ECLK | 1     | Clock   | Rising Edge  | Fast edge clock                           |
| SCLK | 1     | Clock   | Rising Edge  | Primary clock input (divide-by-4 of ECLK) |
| RST  | 1     | Control | High         | Reset to DDR registers                    |

**Table 606: Output Ports**

| Name | Range | Type | Active State | Description                                                                                                             |
|------|-------|------|--------------|-------------------------------------------------------------------------------------------------------------------------|
| Q    | 1     | Data | High         | DDR data output on both edges of SCLK<br>D0, D2, D4, D6: Positive edge of ECLK<br>D1, D3, D5, D7: Negative edge of ECLK |

**Table 607: Parameters**

| Name | Values                  | Description                   |
|------|-------------------------|-------------------------------|
| GSR  | "ENABLED"<br>"DISABLED" | Enable or disable GSR feature |

**Note**

Avoid using IDDRX2/ODDRX2 and above gearing on a BIDI I/O.

- ▶ Only IDDRX1 and ODDRX1 can be used with a single BIDI I/O.
- ▶ If using IDDRX2 and above gearing, this must be used only with an INPUT.
- ▶ If using ODDRX2 and above gearing, this must be used only with an OUTPUT.

**ODDRX4B**

Output for Generic DDR X4 Using 8:1 Gearing

Architectures Supported:

- ▶ LFMX04

**Table 608: Input Ports**

| Name | Range | Description                        |
|------|-------|------------------------------------|
| D0   | 1     | Data at the same edge of the clock |
| D1   | 1     | Data at the same edge of the clock |
| D2   | 1     | Data at the same edge of the clock |
| D3   | 1     | Data at the same edge of the clock |
| D4   | 1     | Data at the same edge of the clock |
| D5   | 1     | Data at the same edge of the clock |
| D5   | 1     | Data at the same edge of the clock |
| D7   | 1     | Data at the same edge of the clock |
| ECLK | 1     | Edge clock                         |
| SCLK | 1     | Clock from the CIB                 |
| RST  | 1     | RESET to this block from the CIB   |

**Table 609: Output Ports**

| Name | Range | Description     |
|------|-------|-----------------|
| Q    | 1     | DDR output data |

**Table 610: Parameters**

| Name | Values                            | Description                   |
|------|-----------------------------------|-------------------------------|
| GSR  | "ENABLED" (default)<br>"DISABLED" | Enable or disable GSR feature |

**Description**

ODDRX4B is the output for generic DDR X4 using 8:1 gearing. It uses the VPIC\_TX hardware cell. It is used for top bank only.

## ODDRX4DQ

DQ output for DDR3 memory

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFMXO5
- ▶ LIFCL-40,LIFCL-17
- ▶ UT24C
- ▶ UT24CP

This primitive is used to generate DQ data output for DDR3/DDR3L and LPDDR2/LPDDR3 memory interfaces using x4 gearing. It is also used to generate the CA bus for LPDDR2/LPDDR3 interfaces using X4 gearing.

**Table 611: Input Ports**

| Name    | Range | Description                                                                                              |
|---------|-------|----------------------------------------------------------------------------------------------------------|
| D       | 7:0   | Data input to the ODDR. D0 is output first, D7 last.                                                     |
| DQSW270 | 1     | Clock that is 90° ahead of DQSW used to generate DQ. DQSW includes write leveling phase shift from ECLK. |
| ECLK    | 1     | Fast edge clock.                                                                                         |
| SCLK    | 1     | Primary clock input (divide-by-4 of ECLK).                                                               |
| RST     | 1     | Reset to DDR registers.                                                                                  |

**Table 612: Output Ports**

| Name | Range | Description                              |
|------|-------|------------------------------------------|
| Q    | 1     | DDR data output on both edges of DQSW270 |

**Table 613: Parameters**

| Name | Values                                     | Description              |
|------|--------------------------------------------|--------------------------|
| GSR  | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable global set/reset. |

## ODDRX4DQS

DQS Output for DDR3 memory

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFMXO5
- ▶ LIFCL-40,LIFCL-17
- ▶ UT24C
- ▶ UT24CP

This primitive is used to generate DQS clock output for DDR3/DDR3L and LPDDR2/LPDDR3 memory interfaces using x4 gearing. It is also used to

generate CK and control (CKE, CS\_N, ODT) for LPDDR2/LPDDR3 memory interfaces using x4 gearing.

**Table 614: Input Ports**

| Name | Range | Description                                          |
|------|-------|------------------------------------------------------|
| D    | 7:0   | Data input to the ODDR. D0 is output first, D7 last. |
| DQSW | 1     | DQSW includes write leveling phase shift from ECLK.  |
| ECLK | 1     | Fast edge clock.                                     |
| SCLK | 1     | Primary clock input (divide-by-4 of ECLK).           |
| RST  | 1     | Reset to DDR registers.                              |

**Table 615: Output Ports**

| Name | Range | Description                            |
|------|-------|----------------------------------------|
| Q    | 1     | DDR data output on both edges of DQSW. |

**Table 616: Parameters**

| Name | Values                                     | Description              |
|------|--------------------------------------------|--------------------------|
| GSR  | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable global set/reset. |

## ODDRX5

Generic X5 ODDR

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C

## ▶ UT24CP

This primitive is used for Generic x5 ODDR implementation.

**Table 617: Input Ports**

| Name | Range | Description                                                        |
|------|-------|--------------------------------------------------------------------|
| D    | 9:0   | Parallel data input to the ODDR. D0 is sent out first and D9 last. |
| ECLK | 1     | Fast edge clock.                                                   |
| SCLK | 1     | Primary clock input (divide-by-5 of ECLK).                         |
| RST  | 1     | Reset to DDR registers.                                            |

**Table 618: Output Ports**

| Name | Range | Description                            |
|------|-------|----------------------------------------|
| Q    | 1     | DDR data output on both edges of ECLK. |

**Table 619: Parameters**

| Name | Values                                     | Description              |
|------|--------------------------------------------|--------------------------|
| GSR  | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable global set/reset. |

**Note**

Avoid using IDDRX2/ODDRX2 and above gearing on a BIDI I/O.

- ▶ Only IDDRX1 and ODDRX1 can be used with a single BIDI I/O.
- ▶ If using IDDRX2 and above gearing, this must be used only with an INPUT.
- ▶ If using ODDRX2 and above gearing, this must be used only with an OUTPUT.

**ODDRX5A**

Generic x5 ODDR implementation

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 620: Input Ports**

| Name | Range | Type | Active State | Description    |
|------|-------|------|--------------|----------------|
| D0   | 1     | Data | High         | DDR data input |
| D1   | 1     | Data | High         | DDR data input |
| D2   | 1     | Data | High         | DDR data input |
| D3   | 1     | Data | High         | DDR data input |
| D4   | 1     | Data | High         | DDR data input |
| D5   | 1     | Data | High         | DDR data input |
| D6   | 1     | Data | High         | DDR data input |

**Table 620: Input Ports (Continued)**

| Name | Range | Type    | Active State | Description                               |
|------|-------|---------|--------------|-------------------------------------------|
| D7   | 1     | Data    | High         | DDR data input                            |
| D2   | 1     | Data    | High         | DDR data input                            |
| D3   | 1     | Data    | High         | DDR data input                            |
| ECLK | 1     | Clock   | Rising Edge  | Fast edge clock                           |
| SCLK | 1     | Clock   | Rising Edge  | Primary clock input (divide-by-5 of ECLK) |
| RST  | 1     | Control | High         | Reset to DDR registers                    |

**Table 621: Output Ports**

| Q    | Data output |

**Table 647: Parameters**

| Name | Values                            | Description                         |
|------|-----------------------------------|-------------------------------------|
| GSR  | "ENABLED" (default)<br>"DISABLED" | Enable or disable global set/reset. |

**Note**

This primitive must be paired with an output or bidirectional buffer. The mapper automatically assigns the primitive and its buffer to the same PIC. Use the PIN or LOC properties, or the LOCATE COMP preference, on the buffer per normal use, but not on this primitive.

**Table 648: Truth Table**

| INPUTS |    |      |    | OUTPUTS |
|--------|----|------|----|---------|
| D      | SP | SCLK | PD | Q       |
| X      | 0  | X    | 0  | Q       |
| X      | X  | X    | 1  | 1       |
| 0      | 1  | ↑    | 0  | 0       |
| 1      | 1  | ↑    | 0  | 1       |

X = Don't care

When GSR=0, Q=1 (D=SP=SCLK=PD=X)

**OFS1P3DX**

Positive Edge Triggered D Flip-Flop with Positive Level Enable, Positive Level Asynchronous Clear, and System Clock (used in output PIC area only)

Architectures Supported:

## ▶ LFMXO4

**Table 649: Input Ports**

| Name | Description           |
|------|-----------------------|
| D    | Data input            |
| SP   | Positive clock enable |
| CK   | Clock input           |
| CD   | Asynchronous reset    |

**Table 650: Output Ports**

| Name | Description |
|------|-------------|
| Q    | Data output |

**Table 651: Parameters**

| Name | Values                            | Description                         |
|------|-----------------------------------|-------------------------------------|
| GSR  | “ENABLED” (default)<br>“DISABLED” | Enable or disable global set/reset. |

**Note**

This primitive must be paired with an output or bidirectional buffer. The mapper automatically assigns the primitive and its buffer to the same PIC. Use the PIN or LOC properties, or the LOCATE COMP preference, on the buffer per normal use, but not on this primitive.

**Table 652: Truth Table**

| Inputs |    |      |    | Outputs |
|--------|----|------|----|---------|
| D      | SP | SCLK | CD | Q       |
| X      | 0  | X    | 0  | Q       |
| X      | X  | X    | 1  | 0       |
| 0      | 1  | ↑    | 0  | 0       |
| 1      | 1  | ↑    | 0  | 1       |

X = Don't care

When GSR=0, Q=0 (D=SP=SCLK=CD=X)

## OFS1P3IX

Positive Edge Triggered D Flip-Flop with Positive Level Synchronous Clear, Positive Level Enable (Clear overrides Enable), and System Clock (used in output PIC area only)

Architectures Supported:

▶ LFMXO4

**Table 653: Input Ports**

| Name | Description                       |
|------|-----------------------------------|
| D    | Data input                        |
| SP   | Positive clock enable             |
| SCLK | Serial clock; Primary clock input |
| CD   | Asynchronous reset                |

**Table 654: Output Ports**

| Name | Description |
|------|-------------|
| Q    | Data output |

**Table 655: Parameters**

| Name | Values                            | Description                         |
|------|-----------------------------------|-------------------------------------|
| GSR  | "ENABLED" (default)<br>"DISABLED" | Enable or disable global set/reset. |

**Note**

This primitive must be paired with an output or bidirectional buffer. The mapper automatically assigns the primitive and its buffer to the same PIC. Use the PIN or LOC properties, or the LOCATE COMP preference, on the buffer per normal use, but not on this primitive.

**Table 656: Truth Table**

| Inputs |    |      |    | Outputs |
|--------|----|------|----|---------|
| D      | SP | SCLK | CD | Q       |
| X      | 0  | X    | 0  | Q       |
| X      | X  | ↑    | 1  | 0       |
| 0      | 1  | ↑    | 0  | 0       |
| 1      | 1  | ↑    | 0  | 1       |

X = Don't care

When GSR=0, Q=0 (D=SP=SCLK=CD=X)

**OFS1P3JX**

Positive Edge Triggered D Flip-Flop with Positive Level Synchronous Preset, Positive Level Enable (Preset overrides Enable), and System Clock (used in output PIC area only)

## Architectures Supported:

## ▶ LFMXO4

**Table 657: Input Ports**

| Name | Description                       |
|------|-----------------------------------|
| D    | Data input                        |
| SP   | Positive clock enable             |
| SCLK | Serial clock; Primary clock input |
| PD   | Asynchronous preset               |

**Table 658: Output Ports**

| Name | Description |
|------|-------------|
| Q    | Data output |

**Table 659: Parameters**

| Name | Values                            | Description                         |
|------|-----------------------------------|-------------------------------------|
| GSR  | “ENABLED” (default)<br>“DISABLED” | Enable or disable global set/reset. |

**Note**

This primitive must be paired with an output or bidirectional buffer. The mapper automatically assigns the primitive and its buffer to the same PIC. Use the PIN or LOC properties, or the LOCATE COMP preference, on the buffer per normal use, but not on this primitive.

**Table 660: Truth Table**

| Inputs |    |      |    | Outputs |
|--------|----|------|----|---------|
| D      | SP | SCLK | PD | Q       |
| X      | 0  | X    | 0  | Q       |
| X      | X  | ↑    | 1  | 1       |
| 0      | 1  | ↑    | 0  | 0       |
| 1      | 1  | ↑    | 0  | 1       |

X = Don't care

When GSR=0, Q=1 (D=SP=SCLK=PD=X)

## OSC

Wrapper for Oscillator Block

It includes a trimmed low frequency oscillator, and a trimmed high frequency oscillator.

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 661: Input Ports**

| Name        | Description                                          |
|-------------|------------------------------------------------------|
| HFSDSCEN    | SED/SEC enable from fabric                           |
| JTAG_LRST_N | JTAG local reset input from fabric (Active Low)      |
| LMMI_CLK    | LMMI clock input from fabric                         |
| LMMI_LRST_N | LMMI local reset input from fabric (Active Low)      |
| SEDC_CLK    | SEDC Clock, hardware inferred from OSC.HFSDCOUT      |
| SEDC_LRST_N | SEDC local reset input from fabric (Active Low)      |
| WDT_LRST_N  | Watch Dog Timer Local Reset from fabric (Active Low) |

**Table 662: Output Ports**

| Name       | Description                                            |
|------------|--------------------------------------------------------|
| HFCLKOUT   | High frequency clock output to PCLK tree               |
| LFCLKOUT   | Low frequency clock output to PCLK tree                |
| HFSDCOUT   | SED/SEC clock output, hardware inferred to OSC.SED_CLK |
| HSE_CLK    | HSE clock output, hardware inferred to CRE.CRE_CLK     |
| LMMI_CLK_O | LMMI clock output to CONFIG_LMMI(A).LMMICK             |
| LMMI_RST   | LMMI reset output to CONFIG_LMMI(A).LMMIRESETN         |
| SEDC_RST   | SEDC reset output to SEDC.RSTSEDC                      |

**Table 662: Output Ports (Continued)**

| Name      | Description                                                       |
|-----------|-------------------------------------------------------------------|
| CFG_CLK   | Config clock output to CONFIG_LMMI.SMCLK, CRE.CFG_CLK, JTAG.SMCLK |
| SMCLK_RST | Config clock reset output to CONFIG_LMMI.RSTSMCLK                 |
| WDT_CLK   | Watchdog timer clock output to WDT.WDT_CLK                        |
| WDT_RST   | Watchdog timer reset output to WDT.WDT_RST                        |

**Table 663: Parameters**

| Name            | Values                                     | Description                                                                                            |
|-----------------|--------------------------------------------|--------------------------------------------------------------------------------------------------------|
| DTR_EN          | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Digital Temperature Readout block enable from MIB                                                      |
| HF_CLK_DIV      | "1" ( <i>default</i> )<br>"1" - "255"      | User assignable high frequency oscillator output clock divider configuration (div2~div256)             |
| HF_SED_SEC_DIV  | "1" ( <i>default</i> )<br>"1" - "255"      | User assignable high frequency oscillator output SED and SEC clock divider configuration (div2~div256) |
| HF_FABRIC_EN    | "DISABLED" ( <i>default</i> )<br>"ENABLED" | High frequency oscillator trim input source mux select (for TEST only)                                 |
| HF_OSC_EN       | "ENABLED" ( <i>default</i> )<br>"DISABLED" | High frequency oscillator output enable, controlled by the user                                        |
| HFDIV_FABRIC_EN | "ENABLED" ( <i>default</i> )<br>"DISABLED" | High frequency oscillator divider configuration mux select, fabric divider enable                      |
| LF_FABRIC_EN    | "DISABLED" ( <i>default</i> )<br>"ENABLED" | Low frequency oscillator trim input source mux select, fabric driven enable (for TEST only)            |
| LF_OUTPUT_EN    | "DISABLED" ( <i>default</i> )<br>"ENABLED" | Low frequency clock output enable                                                                      |
| DEBUG_N         | "DISABLED" ( <i>default</i> )<br>"ENABLED" | Oscillator debug mode enable                                                                           |
| MCJTAGGSRNDIS   | "EN" ( <i>default</i> )<br>"DIS"           | JTAG GSR enable/disable control                                                                        |
| MCLMMIGSRNDIS   | "EN" ( <i>default</i> )<br>"DIS"           | CONFIG_LMMI GSR enable/disable control                                                                 |
| MCSEDCGSRNDIS   | "EN" ( <i>default</i> )<br>"DIS"           | SEDC GSR enable/disable control                                                                        |

**Table 663: Parameters**

| Name         | Values                               | Description                              |
|--------------|--------------------------------------|------------------------------------------|
| MCWDTGSRNDIS | "EN" ( <i>default</i> )<br>"DIS"     | WDT GSR enable/disable control           |
| SMCLK_DIV    | "3" ( <i>default</i> )<br>"3" - "10" | Config clock divider for simulation only |

**Note:**

The timer uses these device constraint equations to know what the periods of the output clocks of the Oscillator will be based on user design settings.

The numerical values in the equations have units of picoseconds.

For LFCLKOUT (created clock): ADJUSTED\_PERIOD=31250000

For I2CCKOUT (created clock): ADJUSTED\_PERIOD=7812500

For HFCLKOUT (created clock): ADJUSTED\_PERIOD=6666.66667 \* HF\_CLK\_DIV

For HFSDCOUT (created clock): ADJUSTED\_PERIOD=6666.66667 \*  
HF\_SED\_SEC\_DIV

## OSCA

Internal Oscillator

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 664: Input Ports**

| Name     | Description                        |
|----------|------------------------------------|
| HFOUTEN  | High frequency clock output enable |
| HFSDSCEN | SED/SEC enable from fabric         |

**Table 665: Output Ports**

| Name     | Description                                                               |
|----------|---------------------------------------------------------------------------|
| HFCLKOUT | High frequency clock output                                               |
| LFCLKOUT | Low Frequency clock output                                                |
| HFCLKCFG | High Frequency Reference Clock; 450 MHz                                   |
| HFSDCOUT | 450 MHz with Programmable Divider (2~256) to User for SED/SEC Application |

**Table 666: Parameters**

| Name           | Values               | Description                                              | Inferable |
|----------------|----------------------|----------------------------------------------------------|-----------|
| HF_CLK_DIV     | 1 ( <i>default</i> ) | HF oscillator output divider configuration (div2~div256) | No        |
| HF_SED_SEC_DIV | 1 ( <i>default</i> ) | HF oscillator output divider configuration (div2~div256) | No        |

**Table 666: Parameters**

| Name         | Values                        | Description                       | Inferable |
|--------------|-------------------------------|-----------------------------------|-----------|
| HF_OSC_EN    | "ENABLED" ( <i>default</i> )  | HF oscillator enable              | No        |
| LF_OUTPUT_EN | "DISABLED" ( <i>default</i> ) | Low frequency clock output enable | No        |

OSCA is the source of the internal clock for configuration. After configuration this oscillator is disabled by default. If needed, it can be enabled by instantiating OSCA or Sysbus (with sys\_clk\_sel=OSC option). OSCA may be used as a general-purpose clock to drive FPGA logic.

## OSCE

High-frequency oscillator

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 667: Input Ports**

| Name     | Description                    |
|----------|--------------------------------|
| EN       | Enable CLKOUT                  |
| SEL400_N | Switch between 400 and 320 MHz |

**Table 668: Output Ports**

| Name   | Description            |
|--------|------------------------|
| CLKOUT | Output clock to fabric |

**Table 669: Parameters**

| Name    | Values                                       | Description          |
|---------|----------------------------------------------|----------------------|
| CLK_DIV | "1" (default)<br>Integer string "1" to "256" | CLKOUT divider value |

## OSCD

High-frequency oscillator

Architectures supported:

- ▶ LIFCL-33U

**Table 670: Input Ports**

| Name       | Description                                                                                                     |
|------------|-----------------------------------------------------------------------------------------------------------------|
| HFOUTEN    | HF clock (225 MHz) output enable: just for test                                                                 |
| HFSDSCEN   | HF user clock output enable                                                                                     |
| HFOUTCIBEN | CIB control to turn on/off HF-OSC, function during user mode with mc1_en_hf_osc_cib high                        |
| REBOOT     | CIB control to enable/disable hf_clk_config output, function during user mode with mc1_en_hf_config_on_cib high |

**Table 671: Output Ports**

| Name     | Description                                                                                                                                |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------|
| HFCLKOUT | 450 MHz with programmable divider (2~256) to user                                                                                          |
| LFCLKOUT | Low frequency clock output after div4: 32 KHz                                                                                              |
| HFCLKCFG | 450 MHz going to Config block. Config Block would generate the clk_config, as well as the other blocks it needs, such as SPI or SED clocks |
| HFSDCOUT | 450 MHz with programmable divider (2~256) to CFG                                                                                           |

**Table 672: Parameters**

| Name           | Description                                                                               |
|----------------|-------------------------------------------------------------------------------------------|
| DTR_EN         | DTR block enable from MIB                                                                 |
| HF_CLK_DIV     | User assignable HF oscillator output divider configuration (div2~div256)                  |
| HF_SED_SEC_DIV | User assignable HF oscillator output divider configuration (div2~div256)                  |
| HF_FABRIC_EN   | High frequency oscillator trim source mux select                                          |
| HF_OSC_EN      | HF oscillator enable, controlled by the user                                              |
| LF_FABRIC_EN   | Low frequency oscillator trim source mux select, fabric driven trim enable                |
| LF_OUTPUT_EN   | Low frequency clock output enable                                                         |
| DEBUG_N        | Ignore/enable the SLEEP/STOP function during the USER mode. 0: Ignore the SLEEP/STOP mode |

## OSCH

Oscillator

Architectures Supported:

▶ LFMXO4

**Table 673: Input Ports**

| Name  | Range | Description                     |
|-------|-------|---------------------------------|
| STDBY | 1     | Standby – power down oscillator |

**Table 674: Output Ports**

| Name     | Range | Description                    |
|----------|-------|--------------------------------|
| OSC      | 1     | Oscillator clock output        |
| SEDSTDBY | 1     | Standby – power down SED clock |

**Table 675: Parameters**

### Description

By default, the internal oscillator will be enabled even if the user does not have it instantiated in the design. User can disable the internal oscillator by instantiating it in the design and using the STDBY port. This port can be connected to a user signal or an I/O pin. The user must insure that the oscillator is not turned off when it is needed for operations such as WISHBONE bus operations, SPI or I2C configuration, SPI or I2C user mode operation, SPI or I2C background Flash updates or SED.

### OSCH Usage with VHDL

```

COMPONENT OSCH
-- synthesis translate_off
  GENERIC (NOM_FREQ: string := "2.56");
-- synthesis translate_on
  PORT (STDBY   : IN  std_logic;
        OSC     : OUT std_logic;

```

```
        SEDSTDBY: OUT std_logic);  
END COMPONENT;  
  
attribute NOM_FREQ : string;  
attribute NOM_FREQ of OSCInst0 : label is "2.56";  
  
begin  
  
OSCInst0: OSCH  
-- synthesis translate_off  
  GENERIC MAP (  
    NOM_FREQ => "2.5"  
  )  
-- synthesis translate_on  
  PORT MAP (STDBY => stdby,  
    OSC    => osc_int,  
    SEDSTDBY => stdby_sed  
  );
```

## OSHX2

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL-40,LIFCL-17
- ▶ UT24C
- ▶ UT24CP

This primitive is used to generate the CS\_N control for DDR3/DDR3L memory with x2 gearing.

**Table 676: Input Ports**

| Name   | Description                                    |
|--------|------------------------------------------------|
| D0, D1 | Data input. D0 is output first, followed by D1 |
| ECLK   | ECLK input.                                    |
| SCLK   | Primary clock input (divide-by-2 of ECLK).     |
| RST    | Reset input.                                   |

**Table 677: Output Ports**

| Name | Description                 |
|------|-----------------------------|
| Q    | Address and command output. |

**Table 678: Parameters**

| Name | Values                                     | Description              |
|------|--------------------------------------------|--------------------------|
| GSR  | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable global set/reset. |

## OSHX4

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX

- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL-40,LIFCL-17
- ▶ UT24C
- ▶ UT24CP

**Table 679: Input Ports**

| Name | Range | Description                               |
|------|-------|-------------------------------------------|
| D    | 3:0   | Data input. D0 is output first, D3 last.  |
| ECLK | 1     | ECLK input.                               |
| SCLK | 1     | Primary clock input (divide-by-4 of ECLK) |
| RST  | 1     | Reset input.                              |

**Table 680: Output Ports**

| Name | Range | Description                 |
|------|-------|-----------------------------|
| Q    | 1     | Address and command output. |

This primitive is used to generate the CS\_N control for DDR3 memory with x4 gearing and write leveling.

**Table 681: Parameters**

| Name | Values                                 | Description              |
|------|----------------------------------------|--------------------------|
| GSR  | ENABLED ( <i>default</i> )<br>DISABLED | Enable global set/reset. |

## OUTDELAYA

Add static and dynamic delay to DOUT and TOUT for write training in LPDDR4 mode.

Architectures supported:

- ▶ LFCPNX
- ▶ LFMXO5T
- ▶ LFMXO5TD
- ▶ UT24CP

**Table 682: Input Ports**

| Name                | Description                                                                                            |
|---------------------|--------------------------------------------------------------------------------------------------------|
| DOUTI               | The input for DOUT                                                                                     |
| TOUTI               | The input for TOUT                                                                                     |
| LOAD_N_LPDDR4_WT    | For LPDDR4 write training, asynchronous reset the output final delay code to factory default value.    |
| MOVE_LPDDR4_WT      | For LPDDR4 write training, move pulse's rising edge will change the code according to direction value. |
| DIRECTION_LPDDR4_WT | For LPDDR4 write training fine delay, "0" to increase the code, "1" to decrease the code.              |

**Table 683: Output Ports**

| Name           | Description                                                                                              |
|----------------|----------------------------------------------------------------------------------------------------------|
| DOUT           | PIC data output, to ASICIO                                                                               |
| TOUT           | PIC tri-state output, to ASICIO                                                                          |
| COUT_LPDDR4_WT | For LPDDR4 write training, write training margin test output flag to indicate the underflow or overflow. |

**Table 684: Parameters**

| Name               | Values                        | Description                                                                                                            |
|--------------------|-------------------------------|------------------------------------------------------------------------------------------------------------------------|
| MARGIN_TEST_ENABLE | DISABLED (default)<br>ENABLED | For LPDDR4 write training, margin test enable<br>0: disable margin test<br>1: enable margin test                       |
| DEL_VALUE          | 0...127 (default = 0)         | For LPDDR4 write training, output fine delay fuse setting:<br>7b0000_0000: minimum delay<br>7b1111_1111: maximum delay |

## OUTDELAYB

Add static delay to DOUT and TOUT for write training in LPDDR4 mode.

Architectures supported:

- ▶ LFCPNX
- ▶ LFMXO5T
- ▶ LFMXO5TD
- ▶ UT24CP

**Table 685: Input Ports**

| Name  | Description        |
|-------|--------------------|
| DOUTI | The input for DOUT |
| TOUTI | The input for TOUT |

**Table 686: Output Ports**

| Name | Description                     |
|------|---------------------------------|
| DOUT | PIC data output, to ASICIO      |
| TOUT | PIC tri-state output, to ASICIO |

**Table 687: Parameters**

| Name      | Values                   | Description                                                                                                            |
|-----------|--------------------------|------------------------------------------------------------------------------------------------------------------------|
| DEL_VALUE | 0...127<br>(default = 0) | For LPDDR4 write training, output fine delay fuse setting:<br>7b0000_0000: minimum delay<br>7b1111_1111: maximum delay |

## OUTDELAYC

Add static and dynamic delay to DOUT and TOUT for write training in LPDDR4 mode.

Architectures supported:

- ▶ LFCPNX
- ▶ LFMXO5T
- ▶ LFMXO5TD
- ▶ UT24CP

**Table 688: Input Ports**

| Name             | Description                                                                                            |
|------------------|--------------------------------------------------------------------------------------------------------|
| DOUTI            | The input for DOUT                                                                                     |
| TOUTI            | The input for TOUT                                                                                     |
| LOAD_N_LPDDR4_WT | For LPDDR4 write training, asynchronous reset the output final code for factory default value.         |
| MOVE_LPDDR4_WT   | For LPDDR4 write training, move pulse's rising edge will change the code according to direction value. |

**Table 688: (Continued)Input Ports**

| Name                | Description                                                                                |
|---------------------|--------------------------------------------------------------------------------------------|
| DIRECTION_LPDDR4_WT | For LPDDR4 write training fine delay, "0" to increase the code, "1" to decrease the code.  |
| RANKSELECT          | 0 - Select delay rank 0<br>1 - Select delay rank 1                                         |
| RANKENABLE          | 0 - Select bypassed actual path delay code<br>1 - Select registered actual path delay code |
| RANK0UPDATE         | 0 - Rank - 0 registers not enabled<br>1 - Enable Rank - 0 registers                        |
| RANK1UPDATE         | 0 - Rank - 1 registers not enabled<br>1 - Enable Rank - 1 registers                        |
| SCLK                | SCLK clock for inputs from CIB                                                             |

**Table 689: Output Ports**

| Name           | Description                                                                                              |
|----------------|----------------------------------------------------------------------------------------------------------|
| DOUT           | PIC data output, to ASICIO                                                                               |
| TOUT           | PIC tri-state output, to ASICIO                                                                          |
| COUT_LPDDR4_WT | For LPDDR4 write training, write training margin test output flag to indicate the underflow or overflow. |

**Table 690: Parameters**

| Name               | Values                                 | Description                                                                                                            |

| PERSTN      | 1            | PCIe Reset (Active Low)              |
| PMDPAST     | 4:0          | PMD Passive State                    |
| PRMSGSD     | 1            | Pre-Snoop Message Detected           |
| PRNOSNP     | 12:0         | Pre-No Snoop                         |
| PRNSNP      | 1            | Pre-Snoop Response Enable            |
| PRSNPRE     | 12:0         | Pre-Snoop                            |
| PRSNPRE     | 1            | Pre-Snoop Ready Enable               |
| PPBDREG     | 31:0         | PPB Debug Register Access            |
| REXTCK      | 1            | Reference External Clock             |
| REXTRST     | 1            | Reference External Reset             |
| RSTUSRN     | 1            | Reset User (Active Low)              |
| ULTSDIS     | 1            | Ultrascale Disable                   |

**Table 691: Input Ports (Continued)**

| <b>Name</b> | <b>Range</b> | <b>Description</b>                         |
|-------------|--------------|--------------------------------------------|
| UCFGADDR    | 9:0          | User Configuration Address                 |
| UCFGF       | 2:0          | User Configuration Frame Enable            |
| UCFGSERD    | 1            | User Configuration Serial Data             |
| UCFGVD      | 1            | User Configuration Valid Data              |
| UCFGWRBE    | 3:0          | User Configuration Write Byte Enable       |
| UCFGWRD     | 31:0         | User Configuration Write Data              |
| UCFGWRDN    | 1            | User Configuration Write Data (Active Low) |
| USERAUPD    | 1            | User Area Update                           |
| USERTRS     | 3:0          | User Transaction Start                     |
| VRXCINIT    | 1            | Virtual RX Channel Initialization          |
| VRXCNH      | 11:0         | Virtual RX Channel Header                  |
| VRXCNINF    | 1            | Virtual RX Channel Info                    |
| VRXCRRE     | 1            | Virtual RX Channel Ready                   |
| VRXRDY      | 1            | Virtual RX Ready                           |
| VXD         | 31:0         | Virtual Data                               |
| VXDP        | 3:0          | Virtual Data Parity                        |
| VXEOP       | 1            | Virtual End of Packet                      |
| VXEOPN      | 1            | Virtual End of Packet (Active Low)         |
| VXSOP       | 1            | Virtual Start of Packet                    |
| VXVD        | 1            | Virtual Valid Data                         |
| S0REFCKN    | 1            | Reference Clock Negative (Lane 0)          |
| S0REFCKP    | 1            | Reference Clock Positive (Lane 0)          |
| S0REFRET    | 1            | Reference Clock Return (Lane 0)            |
| S0REXT      | 1            | Reference External Termination (Lane 0)    |
| S0RXN       | 1            | Serial Receive Negative (Lane 0)           |
| S0RXP       | 1            | Serial Receive Positive (Lane 0)           |
| CLKREQI     | 1            | Clock Request Input                        |

**Table 692: Output Ports**

| <b>Name</b>    | <b>Range</b> | <b>Description</b>                    |
|----------------|--------------|---------------------------------------|
| LMMIRDATA      | 31:0         | Read data                             |
| LMMIRDATAVALID | 1            | Valid data indicator                  |
| LMMIREADY      | 1            | Slave ready signal                    |
| ACJNOUT        | 1            | AC Jitter Noise Output                |
| ACJPOUT        | 1            | AC Jitter Pattern Output              |
| CKUSRO         | 1            | Clock User Output                     |
| ECKINDO        | 1            | External Clock Input Domain Output    |
| ERXCKDO        | 1            | External Receive Clock Domain Output  |
| ETXCKDO        | 1            | External Transmit Clock Domain Output |
| FLR            | 3:0          | Function Level Reset                  |
| MINTO          | 1            | Main Interrupt Output                 |
| PMCTRL         | 4:0          | Power Management Control              |
| PMCTRLLEN      | 1            | Power Management Control Enable       |
| PPBDSEL        | 7:0          | PPB Debug Select                      |
| UDLLKUP        | 1            | User DLL Lock-Up                      |
| UPLLKUP        | 1            | User PLL Lock-Up                      |
| UTLLKUP        | 1            | User TLL Lock-Up                      |
| UCFGRDD        | 31:0         | User Configuration Read Data          |
| UCFGRDE        | 1            | User Configuration Read Enable        |
| UCFGRDY        | 1            | User Configuration Ready              |
| VRXCMDD        | 12:0         | Virtual RX Command Data               |
| VRXD           | 31:0         | Virtual RX Data                       |
| VRXDP          | 3:0          | Virtual RX Data Parity                |
| VRXEOP         | 1            | Virtual RX End of Packet              |
| VRXERR         | 1            | Virtual RX Error                      |
| VRXF           | 1:0          | Virtual RX Frame                      |
| VRXSEL         | 1:0          | Virtual RX Select                     |
| VRXSOP         | 1            | Virtual RX Start of Packet            |
| VRXVD          | 1            | Virtual RX Valid Data                 |
| VXCDINIT       | 1            | Virtual Channel DLL Initialization    |
| VXCDNH         | 11:0         | Virtual Channel DLL Not Held          |

**Table 692: Output Ports (Continued)**

| Name     | Range | Description                       |
|----------|-------|-----------------------------------|
| VTXCRRE  | 1     | Virtual TX Channel Ready          |
| VXRDY    | 1     | Virtual Channel Ready             |
| TESTOUT  | 7:0   | Test Output                       |
| S0TXN    | 1     | Serial Transmit Negative (Lane 0) |
| S0TXP    | 1     | Serial Transmit Positive (Lane 0) |
| CLKREQO  | 1     | Clock Request Output              |
| CLKREQOE | 1     | Clock Request Output Enable       |

**Table 693: Parameters**

| Name                           | Values                   |
|--------------------------------|--------------------------|
| A_CHNGD_MAX                    | "0'b100" (default)       |
| A0_FORCE                       | "DISABLED" (default)     |
| A0_FREEZE                      | "DISABLED" (default)     |
| A0_INIT                        | "0'b000000" (default)    |
| A0DIR_VAL                      | "DISABLED" (default)     |
| A1_FORCE                       | "DISABLED" (default)     |
| A1_FREEZE                      | "DISABLED" (default)     |
| A1_INIT                        | "0'b000000" (default)    |
| A1DIR_VAL                      | "DISABLED" (default)     |
| A2_FORCE                       | "DISABLED" (default)     |
| A2_FREEZE                      | "DISABLED" (default)     |
| A2_INIT                        | "0'b000000" (default)    |
| A2GAIN_CALIB                   | "0'b100110" (default)    |
| ACJTAG_REG                     | "0'b00" (default)        |
| ADDR_LIMIT_PRE_MTHD_CTRL       | "0'b0100" (default)      |
| ADDR_LIMIT_TABLE_MTHD_CTRL     | "0'b00101" (default)     |
| ADIR_OVR                       | "DISABLED" (default)     |
| ADV_CH_CD_SEL                  | "IMPLEMENT_CH" (default) |
| ADV_TARGET_LINK_SPEED_USPORT_A | "DISABLED" (default)     |

## PCIELL

PCIe logical link layer

### Note:

You should not try to use this primitive directly. Instead, use the related IP in IP Catalog. The following information is for reference only.

Architectures supported:

- ▶ LFCPNX
- ▶ LFMXO5T
- ▶ LFMXO5TD
- ▶ LFMXO5-55TDQ
- ▶ UT24CP

### Table 694: Input Ports

Lattice Radiant Software 2025.2.1 Help

**Table 694: Input Ports (Continued)**

| Name                      | Description                                    |
|---------------------------|------------------------------------------------|
| LINK0_RSTUSRN             | User link0 reset                               |
| LINK1_RSTUSRN             | User link1 reset                               |
| ULTSDIS_X1                | Disables LTSSM for link1                       |
| ULTSDIS_X4                | Disables LTSSM for link0                       |
| UCFG_ADDR[9:0]            | Register Address/Offset                        |
| UCFG_F[2:0]               | Function number                                |
| UCFG_USE_LMMI_RDATA       | Use LMMI read data port                        |
| UCFG_VALID                | Transaction request valid signal               |
| UCFG_WR_BE[3:0]           | Byte Enable                                    |
| UCFG_WR_DATA[31:0]        | Write data                                     |
| UCFG_WR_RD_N              | Write=1, Read=0                                |
| UCFG_LINK                 | Which link is making the request               |
| AUX_POWER_DETECTED[1:0]   | Auxiliary Power detected                       |
| TRANSACTIONS_PENDING[7:0] | Non-posted transactions pending                |
| LMMICLK                   | LMMI clock                                     |
| LMMIOFFSET[14:0]          | LMMI address offset                            |
| LMMIREQUEST               | LMMI start transaction                         |
| LMMIRESETN                | LMMI reset                                     |
| LMMIWDATA[31:0]           | LMMI write data                                |
| LMMIWRRDN                 | LMMI write and read control, 1: write, 0: read |
| VC_RX_CREDIT_INIT[1:0]    | Transaction layer, initialize credit counters  |
| VC_RX_CREDIT_NH[23:0]     | Transaction layer, number of NH credit         |
| VC_RX_CREDIT_NH_INF[1:0]  | Transaction Layer, infinite NH credits         |
| VC_RX_CREDIT_RETURN[1:0]  | Transaction Layer, NH credit return signal     |
| VC_RX_READY[1:0]          | Transaction layer, destination ready signal    |
| VC_TX_DATA[127:0]         | TLP Tx Data which can support up to 4 lanes    |
| VC_TX_DATAP[15:0]         | TLP Tx Data Parity                             |
| VC_TX_EOP[1:0]            | Transaction layer, end of packet               |
| VC_TX_EOPN[1:0]           | Transaction layer, end of nullified packet     |
| VC_TX_SOP[1:0]            | Transaction layer, start of packet             |
| VC_TX_VALID[1:0]          | Transaction layer, source valid signal         |
| PIPE_LOCAL_FS[23:0]       | Pipe signal for 4 lanes                        |

**Table 694: Input Ports (Continued)**

| Name                                | Description                                               |
|-------------------------------------|-----------------------------------------------------------|
| PIPE_LOCAL_GET_TX_COEF_VALID[3:0]   | Pipe signal for 4 lanes                                   |
| PIPE_LOCAL_GET_TX_PRESET_COEF[71:0] | Pipe signal for 4 lanes                                   |
| PIPE_LOCAL_IF[23:0]                 | Pipe signal for 4 lanes                                   |
| PIPE_PHY_STATUS[3:0]                | Pipe signal for 4 lanes                                   |
| PIPE_RX_CLKREQ_N[3:0]               | Pipe signal for 4 lanes                                   |
| PIPE_RX_DATA[127:0]                 | Pipe signal for 4 lanes                                   |
| PIPE_RX_DATA_EN[3:0]                | Pipe signal for 4 lanes                                   |
| PIPE_RX_DATA_VALID[3:0]             | Pipe signal for 4 lanes                                   |
| PIPE_RX_DATAK[15:0]                 | Pipe signal for 4 lanes                                   |
| PIPE_RX_ELEC_IDLE[3:0]              | Pipe signal for 4 lanes                                   |
| PIPE_RX_EQ_EVAL_FEEDBACK_DIR[23:0]  | Pipe signal for 4 lanes                                   |
| PIPE_RX_EQ_EVAL_FEEDBACK_FROM[31:0] | Pipe signal for 4 lanes                                   |
| PIPE_RX_START_BLOCK[3:0]            | Pipe signal for 4 lanes                                   |
| PIPE_RX_STATUS[11:0]                | Pipe signal for 4 lanes                                   |
| PIPE_RX_SYNC_HEADER[7:0]            | Pipe signal for 4 lanes                                   |
| PIPE_RX_VALID[3:0]                  | Pipe signal for 4 lanes                                   |
| PIPE_TX_DATA_EN[3:0]                | Pipe signal for 4 lanes                                   |
| PIPE_WIDTH_2G5[7:0]                 | Pipe signal for 4 lanes                                   |
| PIPE_WIDTH_5G0[7:0]                 | Pipe signal for 4 lanes                                   |
| PIPE_WIDTH_8G0[7:0]                 | Pipe signal for 4 lanes                                   |
| PIPE_TX_CLKACK_N_X4[3:0]            | PCS status for link0                                      |
| PIPE_TX_CLKACK_N_X1                 | PCS status for link1                                      |
| LINK0_SEL_PCLK1_AUX0                | PCS select pipe clock or aux clock as main clock in link0 |
| LINK1_SEL_PCLK1_AUX0                | PCS select pipe clock or aux clock as main clock in link1 |
| SCAN_CLK                            | Scan clock for PCIe-LL                                    |
| SCAN_RST                            | Scan reset for PCIe-LL                                    |

**Table 695: Output Ports**

| Name         | Description                            |
|--------------|----------------------------------------|
| LINK0_CKUSRO | User clock for link0 from Fabric clock |
| LINK1_CKUSRO | User clock for link1 from Fabric clock |
| FLR[7:0]     | Function level reset                   |

**Table 695: Output Ports (Continued)**

| Name                              | Description                                           |
|-----------------------------------|-------------------------------------------------------|
| MGMT_INTERRUPT_O[1:0]             | Core interrupt output for 2 links                     |
| PM_DPA_CONTROL[9:0]               | Dynamic Power Allocation for 2 links                  |
| PM_DPA_CONTROL_EN[1:0]            | Dynamic Power Allocation for 2 links                  |
| PM_PB_DATA_SEL[15:0]              | Power Budgeting                                       |
| U_DL_LINK_UP[1:0]                 | Data Link Layer Link Up Status (1) Up (0) Down        |
| U_PL_LINK_UP[1:0]                 | Physical Link Layer Link Up Status (1) Up (0) Down    |
| U_TL_LINK_UP[1:0]                 | Transaction Link Layer Link Up Status (1) Up (0) Down |
| UCFG_RD_DATA[31:0]                | Read data                                             |
| UCFG_RD_DONE[1:0]                 | Read data available for 2 links                       |
| UCFG_READY                        | Core ready signal                                     |
| LMMIRDATA[31:0]                   | Read data                                             |
| LMMIRDATAVALID                    | Valid data indicator                                  |
| LMMIREADY                         | Slave ready signal.                                   |
| VC_RX_CMD_DATA[25:0]              | TLP decode information                                |
| VC_RX_DATA[127:0]                 | TLP Rx Data which can support up to 4 lanes           |
| VC_RX_DATAP[15:0]                 | TLP Rx Data Parity                                    |
| VC_RX_EOP[1:0]                    | End of packet for 2 links                             |
| VC_RX_ERR_ECRC[1:0]               | End of packet with ECRC error                         |
| VC_RX_F[15:0]                     | Physical Function hit by transaction                  |
| VC_RX_SEL[3:0]                    | TLP type (0=Posted, 1=Non Posted, 2=Completion)       |
| VC_RX_SOP[1:0]                    | Start of packet for 2 links                           |
| VC_RX_VALID[1:0]                  | Source Valid signal for 2 links                       |
| VC_TX_CREDIT_INIT[1:0]            | Initialize credit counters                            |
| VC_TX_CREDIT_NH[23:0]             | Number of NH credits                                  |
| VC_TX_CREDIT_RETURN[1:0]          | NH Credit return signal                               |
| VC_TX_READY[1:0]                  | Destination ready signal                              |
| PIPE_BLOCK_ALIGN_CONTROL[3:0]     | Pipe signal for 4 lanes                               |
| PIPE_LOCAL_GET_PRESET_COEF[3:0]   | Pipe signal for 4 lanes                               |
| PIPE_LOCAL_GET_PRESET_INDEX[15:0] | Pipe signal for 4 lanes                               |
| PIPE_POWER_DOWN[7:0]              | Pipe signal for 4 lanes                               |
| PIPE_RATE[7:0]                    | Pipe signal for 4 lanes                               |
| PIPE_REMOTE_EQ_RX_DEEMPH[71:0]    | Pipe signal for 4 lanes                               |

**Table 695: Output Ports (Continued)**

| Name                            | Description                                                               |
|---------------------------------|---------------------------------------------------------------------------|
| PIPE_REMOTE_EQ_RX_PRESET[15:0]  | Pipe signal for 4 lanes                                                   |
| PIPE_REMOTE_FS[23:0]            | Pipe signal for 4 lanes                                                   |
| PIPE_REMOTE_LF[23:0]            | Pipe signal for 4 lanes                                                   |
| PIPE_RX_EI_DISABLE[3:0]         | Pipe signal for 4 lanes                                                   |
| PIPE_RX_EQ_EVAL[3:0]            | Pipe signal for 4 lanes                                                   |
| PIPE_INVALID_REQUEST[3:0]       | Pipe signal for 4 lanes                                                   |
| PIPE_RX_POLARITY[3:0]           | Pipe signal for 4 lanes                                                   |
| PIPE_RX_PRESET_HINT[11:0]       | Pipe signal for 4 lanes                                                   |
| PIPE_RX_PRESET_HINT_ENABLE[3:0] | Pipe signal for 4 lanes                                                   |
| PIPE_TX_CLKREQ_N[3:0]           | Pipe signal for 4 lanes                                                   |
| PIPE_TX_CM_DISABLE[3:0]         | Pipe signal for 4 lanes                                                   |
| PIPE_TX_COMPLIANCE[3:0]         | Pipe signal for 4 lanes                                                   |
| PIPE_TX_DATA[127:0]             | Pipe signal for 4 lanes                                                   |
| PIPE_TX_DATA_VALID[3:0]         | Pipe signal for 4 lanes                                                   |
| PIPE_TX_DATAK[15:0]             | Pipe signal for 4 lanes                                                   |
| PIPE_TX_DEEMPH[71:0]            | Pipe signal for 4 lanes                                                   |
| PIPE_TX_DEEMPH_WINDOW[3:0]      | Pipe signal for 4 lanes                                                   |
| PIPE_TX_DETECT_RX_LOOPBACK[3:0] | Pipe signal for 4 lanes                                                   |
| PIPE_TX_ELEC_IDLE[3:0]          | Pipe signal for 4 lanes                                                   |
| PIPE_TX_MARGIN[11:0]            | Pipe signal for 4 lanes                                                   |
| PIPE_TX_START_BLOCK[3:0]        | Pipe signal for 4 lanes                                                   |
| PIPE_TX_SWING[3:0]              | Pipe signal for 4 lanes                                                   |
| PIPE_TX_SYNC_HEADER[7:0]        | Pipe signal for 4 lanes                                                   |
| BIFUR_SEL[2:0]                  | bifur_sel to PCS_top, PCS_top will use this signal to do In2lk processing |
| LINK1_CSR_PIPE_RESET            | Pipe reset for lane3 in link1                                             |
| LINK0_CSR_PIPE_RESET[3:0]       | Pipe reset for 4 lanes in link0                                           |

## PCLKDIV

Clock Divider for Primary Clock

Architectures supported:

▶ LFCPNX

- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 696: Input Ports**

| Name    | Range | Description     |
|---------|-------|-----------------|
| CLKIN   | 1     | Input clock     |
| LSRPDIV | 1     | Local set/reset |

**Table 697: Output Ports**

| Name   | Range | Description          |
|--------|-------|----------------------|
| CLKOUT | 1     | Output divided clock |

**Table 698: Parameters**

| Name        | Values                            | Description      | Outputs   |
|-------------|-----------------------------------|------------------|-----------|
| DIV_PCLKDIV | X1 (default)                      | Clock divider    | CLKIN/1   |
|             | X2                                |                  | CLKIN/2   |
|             | X4                                |                  | CLKIN/4   |
|             | X8                                |                  | CLKIN/8   |
|             | X16                               |                  | CLKIN/16  |

|-------------|-----------|-------------------------------------------------------------|
| DIV_PCLKDIV | "X1"      | Divider value. Other values X2, X4, X8, X16, X32, X64, X128 |
| GSR         | "ENABLED" | Enable global set/reset                                     |

## PCNTR

Power Controller

Architectures Supported:

- ▶ LFMXO4

**Table 702: Input Ports**

| Name        | Range | Description |
|-------------|-------|-------------|
| CLK         | 1     |             |
| USERTIMEOUT | 1     |             |
| USERSTDBY   | 1     |             |
| CLRFLAG     | 1     |             |
| CFGWAKE     | 1     |             |
| CFGSTDBY    | 1     |             |

**Table 703: Output Ports**

| Name  | Range | Description |
|-------|-------|-------------|
| STOP  | 1     |             |
| STDBY | 1     |             |
| SFLAG | 1     |             |

**Table 704: Parameters**

| Name     | Values                                    | Description                                  |
|----------|-------------------------------------------|----------------------------------------------|
| STDBYOPT | "USER_CFG" (default)<br>"USER"<br>"CFG"   | Specifies the entry option for entry signals |
| TIMEOUT  | "BYPASS" (default)<br>"USER"<br>"COUNTER" | Specifies the stop to standby delay          |
| WAKEUP   | "USER_CFG" (default)<br>"USER"<br>"CFG"   | Specifies the wake option for wake signals   |
| POROFF   | "FALSE" (default)<br>"TRUE"               | Turns on or off POR when in standby          |
| BGOFF    | "FALSE" (default)<br>"TRUE"               | Turns on or off Bandgap when in standby      |

**Description**

PCNTR is the power controller primitive.

For more information, refer to the related technical notes on the Lattice web site.

## PCSREFMUX

Multiplexer of reference clock for PCS. SW provides one set of reference clock, 40K could instantiate one, 80k could instantiate twice and 120k could have three instances.

Architectures supported:

- ▶ LFCPNX
- ▶ LFMXO5T
- ▶ LFMXO5TD
- ▶ UT24CP

**Table 705: Input Ports**

| Name         | Description                                                  |
|--------------|--------------------------------------------------------------|
| DIFFIOCLK0   | PMA PLL refclk from external IO pad0                         |
| DIFFIOCLK1   | PMA PLL refclk from external IO pad1                         |
| PLLCLK0      | MA PLL refclk from GPLL                                      |
| PLLCLK1      | MA PLL refclk from GPLL                                      |
| CLK          | PMA PLL refclk from CIB                                      |
| DIFFIOCLKSEL | Dynamic selection between I/O pad0 and IO pad1 for PCS quad0 |
| CLKSEL[1:0]  | Dynamic selection among I/O pad, PLL and CIB for PCS quad0   |

**Table 706: Output Ports**

| Name   | Description                                |
|--------|--------------------------------------------|
| CLKOUT | PMA PLL refclk output from refclk_mux_tree |

## PCSX1

Wrapper of PCSX1 and MPCS. PCS hard IP block is quad-base but each channel has independent ports, controls, registers and setting to support channel-base, dual-channel-base and quad-base usage.

There are four software parameters:

1. **PROTOCOL:** The protocol implemented in all channels of current PCS instance. The protocol should be set when soft IP instantiates the primitive.
2. **DATARATE:** The data rate of the protocol. The data rate should be set if corresponding data rate exists for the protocol.
3. **LANE\_ID:** User could specify it to locate the PCS instance in device. LANE\_ID should be unique among all PCS instances in the design. Otherwise, software will report error. 'AUTO' is default that SW could determine automatically.
4. **GRP\_NAME:** If multiple PCS instances are used to implement the protocol, same GRP\_NAME should be set in these instances so that software binds them together.

Architectures supported:

- ▶ LFCPNX
- ▶ LFMXO5T
- ▶ LFMXO5TD
- ▶ UT24CP

| PCSK1                                                           |                                                                      |
|-----------------------------------------------------------------|----------------------------------------------------------------------|
| PMACLKIN                                                        | PIPE_PCS_TXCLKOUT                                                    |
| TXCLK                                                           | RXOUTCLK                                                             |
| RXCLK                                                           | TX_ALIGN_CLKOUT                                                      |
| CCCLK                                                           | RX_ALIGN_CLKOUT                                                      |

Table 707: Input Ports

| Name           | Description                                                      |
|----------------|------------------------------------------------------------------|
| PMACLKIN       | This low speed clock will also drive PMA 'epcs_clkln' clock port |
| TXCLK          | User interface tx clock input (From FPGA)                        |
| RXCLK          | User interface rx clock input (From FPGA)                        |
| CCCLK          | CTC clock from Fabric                                            |
| TX_ALIGN_CLKIN | Clock for multi quad usage in TX mode                            |
| RX_ALIGN_CLKIN | Clock for multi quad usage in RX mode                            |

**Table 707: Input Ports (Continued)**

|                       |                                                                              |
|-----------------------|------------------------------------------------------------------------------|
| PERSTN                | Fundamental reset. Will trigger PCS auto calibration                         |
| MPCS_TX_URSTN         | MPCS core logic reset (TX path), but do not reset PMA phy                    |
| MPCS_RX_URSTN         | MPCS core logic reset (RX path), but do not reset PMA phy                    |
| LMMICLK               | LMMI Clock (from FPGA)                                                       |
| LMMIRESETN            | LMMI Reset                                                                   |
| LMMIREQUEST           | LMMI start transaction                                                       |
| LMMIWR_RDN            | LMMI Write=HIGH, LMMI Read=LOW                                               |
| LMMIOFFSET8           | LMMI Word Address/Offset                                                     |
| LMMIOFFSET0           |                                                                              |
| LMMIWDATA7            | LMMI write data                                                              |
| LMMIWDATA0            |                                                                              |
| SDRXP                 | Analog RX diffIO                                                             |
| SDRXN                 | Analog RX diffIO                                                             |
| SDREXT                | External resistance                                                          |
| SDREFRET              |                                                                              |
| SDQ_REFCLKP           | Refclk of IO EOM pll in one quad                                             |
| SDQ_REFCLKN           | Refclk of IO EOM pll in one quad                                             |
| AUXCLK                | Auxiliary clock from Fabric for PCIe-PCS core clock                          |
| ALTCLKIN              | This is from refclk_mux_tree                                                 |
| ALTCLK_SEL            | Selection for alt_clk_in and independent diffIO refclk                       |
| CLKREQI               | Open drain bidirectional CLKREQ# input                                       |
| TX_LALIGN_IN_UP7      | The connection signals between Quads for lane alignment across Quad boundary |
| TX_LALIGN_IN_UP0      |                                                                              |
| TX_LALIGN_IN_DOWN7    | The connection signals between Quads for lane alignment across Quad boundary |
| TX_LALIGN_IN_DOWN0    |                                                                              |
| PIPE_POWER_DOWN1      | Pipe signal open for user, mpcs and ecps sharing                             |
| PIPE_POWER_DOWN0      |                                                                              |
| PIPE_RATE1            | Pipe signal open for user, mpcs and ecps sharing                             |
| PIPE_RATE0            |                                                                              |
| PIPE_TXDETECTRX       | Pipe signal open for user, mpcs and ecps sharing                             |
| PIPE_RX_EQEVAL        | Pipe signal open for user, mpcs and ecps sharing                             |
| PIPE_INVALID_REQUEST  | Pipe signal open for user, mpcs and ecps sharing                             |
| PIPE_RX_PRESET_HINTEN | Pipe signal open for user, mpcs and ecps sharing                             |

**Table 707: Input Ports (Continued)**

|                               |                                                                                                        |
|-------------------------------|--------------------------------------------------------------------------------------------------------|
| PIPE_RX_PRESET_HINT2          | Pipe signal open for user, mpcs and ecps sharing                                                       |
| PIPE_RX_PRESET_HINT0          |                                                                                                        |
| PIPE_RX_POL                   | Pipe signal open for user, mpcs and ecps sharing                                                       |
| PIPE_TX_CLKREQ                | Pipe signal open for user, mpcs and ecps sharing                                                       |
| PIPE_TXCOMM_DIS               | Pipe signal open for user, mpcs and ecps sharing                                                       |
| PIPE_RXEI_DIS                 | Pipe signal open for user, mpcs and ecps sharing                                                       |
| PIPE_L1PMSSEN                 | Pipe signal open for user, mpcs and ecps sharing                                                       |
| PIPE_L1X_ENTRY_REQ            | Pipe signal open for user, mpcs and ecps sharing                                                       |
| PIPE_TX_SWING                 | Pipe signal open for user, mpcs and ecps sharing                                                       |
| PIPE_TX_MARGIN2               | Pipe signal open for user, mpcs and ecps sharing                                                       |
| PIPE_TX_MARGIN0               |                                                                                                        |
| PIPE_TX_DEEMPH17              | Pipe signal open for user, mpcs and ecps sharing                                                       |
| PIPE_TX_DEEMPH2               |                                                                                                        |
| PIPE_TX_DEEMPH_PCS_TX_DATA1   | Pipe signal open for user, mpcs and ecps sharing                                                       |
| PIPE_TX_DEEMPH_PCS_TX_DATA0   |                                                                                                        |
| PIPE_LOCAL_GET_PRESET_COEF    | Pipe signal open for user, mpcs and ecps sharing                                                       |
| PIPE_TX_DATA_VLD              | Pipe signal open for user, mpcs and ecps sharing                                                       |
| PIPE_TX_EI                    | Pipe signal open for user, mpcs and ecps sharing                                                       |
| PIPE_TX_DATA_PCS_TX_DATA31    | Pipe signal open for user, mpcs and ecps sharing                                                       |
| PIPE_TX_DATA_PCS_TX_DATA0     |                                                                                                        |
| PIPE_TX_DATAK_PCS_TX_DATA3    | Pipe signal open for user, mpcs and ecps sharing                                                       |
| PIPE_TX_DATAK_PCS_TX_DATA0    |                                                                                                        |
| PIPE_TX_COMP_PCS_TX_DATA      | Pipe signal open for user, mpcs and ecps sharing                                                       |
| PIPE_TX_START_BLK_PCS_TX_DATA | Pipe signal open for user, mpcs and ecps sharing                                                       |

| PIPE_LOCAL_LF_PCS_RX_DATA0    |                                                                                                                                            |
| PIPE_LOCAL_GET_TX_COEF_VLD    | Pipe signal open for user, mpcs and ecps sharing                                                                                           |
| PIPE_TX_DATA_EN               | Pipe signal open for user, mpcs and ecps sharing                                                                                           |
| PIPE_RX_DATAK_PCS_RX_DATA3    | Pipe signal open for user, mpcs and ecps sharing                                                                                           |
| PIPE_RX_DATAK_PCS_RX_DATA0    |                                                                                                                                            |
| PCS_RX_DATA79                 | Dedicated ports used for pcs rx data                                                                                                       |
| PCS_RX_DATA74                 |                                                                                                                                            |
| PCS_RX_HI_BER                 | The high level of this signal indicates High BER is detected                                                                               |
| PCS_RX_BLK_LOCK               | The high level of this signal indicates the block lock is achieved                                                                         |
| PCS_TX_FIFO_ST3               | Tx fifo status (empty, full)                                                                                                               |
| PCS_TX_FIFO_ST2               |                                                                                                                                            |
| ACJPOUT                       | Jtag mode for PMA. When PMA in jtag mode, user can force data and ctrl to PMA though JTAG signal directly                                  |
| ACJNOUT                       | Jtag mode for PMA. When PMA in jtag mode, user can force data and ctrl to PMA though JTAG signal directly                                  |

## PCSX2

Wrapper of PCSX2 and MPCS. PCS hard IP block is quad-base but each channel has independent ports, controls, registers and setting to support channel-base, dual-channel-base and quad-base usage.

Architectures supported:

- ▶ LFCPNX
- ▶ UT24CP

### Table 709: Input Ports

Lattice Radiant Software 2025.2.1 Help

**Table 709: Input Ports (Continued)**

|                   |                                                           |
|-------------------|-----------------------------------------------------------|
| CH0_RXCLK         | User interface rx clock input (From FPGA)                 |
| CH1_CCCLK         | CTC clock from Fabric                                     |
| CH0_CCCLK         | CTC clock from Fabric                                     |
| TX_ALIGN_CLKIN    | Clock for multi quad usage in TX mode                     |
| RX_ALIGN_CLKIN    | Clock for multi quad usage in RX mode                     |
| CH1_PERSTN        | Fundamental reset. Will trigger PCS auto calibration      |
| CH0_PERSTN        | Fundamental reset. Will trigger PCS auto calibration      |
| CH1_MPCS_TX_URSTN | MPCS core logic reset (TX path), but do not reset PMA phy |
| CH0_MPCS_TX_URSTN | MPCS core logic reset (TX path), but do not reset PMA phy |
| CH1_MPCS_RX_URSTN | MPCS core logic reset (RX path), but do not reset PMA phy |
| CH0_MPCS_RX_URSTN | MPCS core logic reset (RX path), but do not reset PMA phy |
| CH1_LMMICLK       | LMMI Clock (from FPGA)                                    |
| CH0_LMMICLK       | LMMI Clock (from FPGA)                                    |
| CH1_LMMIRESETN    | LMMI Reset                                                |
| CH0_LMMIRESETN    | LMMI Reset                                                |
| CH1_LMMIREQUEST   | LMMI start transaction                                    |
| CH0_LMMIREQUEST   | LMMI start transaction                                    |
| CH1_LMMIWR_RDN    | LMMI Write=HIGH, LMMI Read=LOW                            |
| CH0_LMMIWR_RDN    | LMMI Write=HIGH, LMMI Read=LOW                            |
| CH1_LMMIOFFSET8   | LMMI Word Address/Offset                                  |
| CH1_LMMIOFFSET0   |                                                           |
| CH0_LMMIOFFSET8   | LMMI Word Address/Offset                                  |
| CH0_LMMIOFFSET0   |                                                           |
| CH1_LMMIWDATA7    | LMMI write data                                           |
| CH1_LMMIWDATA0    |                                                           |
| CH0_LMMIWDATA7    | LMMI write data                                           |
| CH0_LMMIWDATA0    |                                                           |
| CH1_SDRXP         | Analog RX diffIO                                          |
| CH0_SDRXP         | Analog RX diffIO                                          |
| CH1_SDRXN         | Analog RX diffIO                                          |
| CH0_SDRXN         | Analog RX diffIO                                          |
| CH1_SDREXT        | External resistance                                       |
| CH0_SDREXT        | External resistance                                       |
| CH1_SDREFRET      | PCSX2 Channel 1 SD Reference Clock Return                 |

**Table 709: Input Ports (Continued)**

|                                                      |                                                                              |
|------------------------------------------------------|------------------------------------------------------------------------------|
| CH0_SDREFRET                                         | Channel 0 SD Reference Clock Return"                                         |
| SDQ_REFCLKP                                          | Refclk of IO EOM pll in one quad                                             |
| SDQ_REFCLKN                                          | Refclk of IO EOM pll in one quad                                             |
| CH1_AUXCLK                                           | Auxiliary clock from Fabric for PCIe-PCS core clock                          |
| CH0_AUXCLK                                           | Auxiliary clock from Fabric for PCIe-PCS core clock                          |
| ALTCLKIN                                             | This is from refclk_mux_tree                                                 |
| ALTCLK_SEL                                           | Selection for alt_clk_in and independent diffIO refclk                       |
| CH1_CLKREQI                                          | Open drain bidirectional CLKREQ# input                                       |
| CH0_CLKREQI                                          | Open drain bidirectional CLKREQ# input                                       |
| TX_LALIGN_IN_UP7<br>TX_LALIGN_IN_UP0                 | The connection signals between Quads for lane alignment across Quad boundary |
| TX_LALIGN_IN_DOWN7<br>TX_LALIGN_IN_DOWN0             | The connection signals between Quads for lane alignment across Quad boundary |
| CH1_PIPE_POWER_DOWN1<br>CH1_PIPE_POWER_DOWN0         | Pipe signal open for user, mpcs and ecps sharing                             |
| CH0_PIPE_POWER_DOWN1<br>CH0_PIPE_POWER_DOWN0         | Pipe signal open for user, mpcs and ecps sharing                             |
| CH1_PIPE_RATE1<br>CH1_PIPE_RATE0                     | Pipe signal open for user, mpcs and ecps sharing                             |
| CH0_PIPE_RATE1<br>CH0_PIPE_RATE0                     | Pipe signal open for user, mpcs and ecps sharing                             |
| CH1_PIPE_TXDETECTRX                                  | Pipe signal open for user, mpcs and ecps sharing                             |
| CH0_PIPE_TXDETECTRX                                  | Pipe signal open for user, mpcs and ecps sharing                             |
| CH1_PIPE_RX_EQEVAL                                   | Pipe signal open for user, mpcs and ecps sharing                             |
| CH0_PIPE_RX_EQEVAL                                   | Pipe signal open for user, mpcs and ecps sharing                             |
| CH1_PIPE_INVALID_REQUEST                             | Pipe signal open for user, mpcs and ecps sharing                             |
| CH0_PIPE_INVALID_REQUEST                             | Pipe signal open for user, mpcs and ecps sharing                             |
| CH1_PIPE_RX_PRESET_HINTEN                            | Pipe signal open for user, mpcs and ecps sharing                             |
| CH0_PIPE_RX_PRESET_HINTEN                            | Pipe signal open for user, mpcs and ecps sharing                             |
| CH1_PIPE_RX_PRESET_HINT2<br>CH1_PIPE_RX_PRESET_HINT0 | Pipe signal open for user, mpcs and ecps sharing                             |
| CH0_PIPE_RX_PRESET_HINT2<br>CH0_PIPE_RX_PRESET_HINT0 | Pipe signal open for user, mpcs and ecps sharing                             |
| CH1_PIPE_RX_POL                                      | Pipe signal open for user, mpcs and ecps sharing                             |

**Table 709: Input Ports (Continued)**

|                                 |                                                  |
|---------------------------------|--------------------------------------------------|

**Table 709: Input Ports (Continued)**

|                                   |                                                                                                                                   |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| CH1_PIPE_TX_DATAK_LL3             | PIPE Tx Data K indicator for 8b10b                                                                                                |
| CH1_PIPE_TX_DATAK_LL0             |                                                                                                                                   |
| CH0_PIPE_TX_DATAK_LL3             | PIPE Tx Data K indicator for 8b10b                                                                                                |
| CH0_PIPE_TX_DATAK_LL0             |                                                                                                                                   |
| CH1_PIPE_TX_COMPLIANCE_LL         | PIPE Tx Compliance. 1==Force disparity to negative before encoding pipe_tx_data[7:0] (for 8b10b compliance pattern). 0==Otherwise |
| CH0_PIPE_TX_COMPLIANCE_LL         | PIPE Tx Compliance. 1==Force disparity to negative before encoding pipe_tx_data[7:0] (for 8b10b compliance pattern). 0==Otherwise |
| CH1_PIPE_TX_ELEC_IDLE_LL          | PIPE Tx Electrical Idle. 1==Idle, 0==Active                                                                                       |
| CH0_PIPE_TX_ELEC_IDLE_LL          |                                                                                                                                   |
| CH1_PIPE_BLOCK_ALIGN_CONTROL_LL   | PIPE Block Align Control. Set to 0 when within a datastream (except for Slave Loopback); otherwise set to 1                       |
| CH0_PIPE_BLOCK_ALIGN_CONTROL_LL   |                                                                                                                                   |
| CH1_PIPE_PRESET_INDX_PCS_TX_DATA3 | Pipe signal open for user, mpcs and ecps sharing                                                                                  |
| CH1_PIPE_PRESET_INDX_PCS_TX_DATA0 |                                                                                                                                   |
| CH0_PIPE_PRESET_INDX_PCS_TX_DATA3 | Pipe signal open for user, mpcs and ecps sharing                                                                                  |
| CH0_PIPE_PRESET_INDX_PCS_TX_DATA0 |                                                                                                                                   |
| CH1_PIPE_REMOTE_FS_PCS_TX_DATA5   | Pipe signal open for user, mpcs and ecps sharing                                                                                  |
| CH1_PIPE_REMOTE_FS_PCS_TX_DATA0   |                                                                                                                                   |
| CH0_PIPE_REMOTE_FS_PCS_TX_DATA5   | Pipe signal open for user, mpcs and ecps sharing                                                                                  |
| CH0_PIPE_REMOTE_FS_PCS_TX_DATA0   |                                                                                                                                   |
| CH1_PIPE_REMOTE_LF_PCS_TX_DATA5   | Pipe signal open for user, mpcs and ecps sharing                                                                                  |
| CH1_PIPE_REMOTE_LF_PCS_TX_DATA0   |                                                                                                                                   |
| CH0_PIPE_REMOTE_LF_PCS_TX_DATA5   | Pipe signal open for user, mpcs and ecps sharing                                                                                  |
| CH0_PIPE_REMOTE_LF_PCS_TX_DATA0   |                                                                                                                                   |
| CH1_PIPE_RX_DEEMPH_PCS_TX_DATA17  | Pipe signal open for user, mpcs and ecps sharing                                                                                  |
| CH1_PIPE_RX_DEEMPH_PCS_TX_DATA0   |                                                                                                                                   |
| CH0_PIPE_RX_DEEMPH_PCS_TX_DATA17  | Pipe signal open for user, mpcs and ecps sharing                                                                                  |
| CH0_PIPE_RX_DEEMPH_PCS_TX_DATA0   |                                                                                                                                   |
| CH1_PIPE_RX_PRESET_PCS_TX_DATA3   | Pipe signal open for user, mpcs and ecps sharing                                                                                  |
| CH1_PIPE_RX_PRESET_PCS_TX_DATA0   |                                                                                                                                   |
| CH0_PIPE_RX_PRESET_PCS_TX_DATA3   | Pipe signal open for user, mpcs and ecps sharing                                                                                  |
| CH0_PIPE_RX_PRESET_PCS_TX_DATA0   |                                                                                                                                   |
| ACTMD                             | Jtag mode for PMA. When PMA in jtag mode, user can force data and ctrl to PMA though JTAG signal directly                         |

**Table 709: Input Ports (Continued)**

|              |                                                                                                           |
|--------------|-----------------------------------------------------------------------------------------------------------|
| CH1_ACTEN    | Jtag mode for PMA. When PMA in jtag mode, user can force data and ctrl to PMA though JTAG signal directly |
| CH0_ACTEN    | Jtag mode for PMA. When PMA in jtag mode, user can force data and ctrl to PMA though JTAG signal directly |
| CH1_ACTACMD  | Jtag mode for PMA. When PMA in jtag mode, user can force data and ctrl to PMA though JTAG signal directly |
| CH0_ACTACMD  | Jtag mode for PMA. When PMA in jtag mode, user can force data and ctrl to PMA though JTAG signal directly |
| CH1_ACTDR11  | Jtag mode for PMA. When PMA in jtag mode, user can force data and ctrl to PMA though JTAG signal directly |
| CH0_ACTDR11  | Jtag mode for PMA. When PMA in jtag mode, user can force data and ctrl to PMA though JTAG signal directly |
| CH1_ACTHIGHZ | Jtag mode for PMA. When PMA in jtag mode, user can force data and ctrl to PMA though JTAG signal directly |
| CH0_ACTHIGHZ | Jtag mode for PMA. When PMA in jtag mode, user can force data and ctrl to PMA though JTAG signal directly |
| SCAN_CLK     | Scan clock for PCS                                                                                        |
| SCAN_RST     | Scan reset for PCS                                                                                        |

**Table 710: Output Ports**

| Name                  | Description                           |
|-----------------------|---------------------------------------|
| CH1_PIPE_PCS_TXCLKOUT | Pipe and PCS tx clock to Fabric       |
| CH0_PIPE_PCS_TXCLKOUT | Pipe and PCS tx clock to Fabric       |
| CH1_RXOUTCLK          | PCS RX clock to Fabric                |
| CH0_RXOUTCLK          | PCS RX clock to Fabric                |
| TX_ALIGN_CLKOUT       | Clock for multi quad usage in TX mode |
| RX_ALIGN_CLKOUT       | Clock for multi quad usage in RX mode |
| CH1_LMMIRDATA_VALID   | LMMI read data valid                  |
| CH0_LMMIRDATA_VALID   | LMMI read data valid                  |
| CH1_LMMIREADY         | LMMI Bus ready                        |
| CH0_LMMIREADY         | LMMI Bus ready                        |
| CH1_LMMIRDATA7        | LMMI read data                        |
| CH1_LMMIRDATA0        |                                       |
| CH0_LMMIRDATA7        | LMMI read data                        |
| CH0_LMMIRDATA0        |                                       |
| CH1_SDTXP             | Analog TX diffIO                      |

**Table 710: Output Ports (Continued)**

| CH1_PCS_RX_HI_BER                 | The high level of this signal indicates High BER is detected                                              |
| CH0_PCS_RX_HI_BER                 | The high level of this signal indicates High BER is detected                                              |
| CH1_PCS_RX_BLK_LOCK               | The high level of this signal indicates the block lock is achieved                                        |
| CH0_PCS_RX_BLK_LOCK               | The high level of this signal indicates the block lock is achieved                                        |
| CH1_PCS_TX_FIFO_ST3               | Tx fifo status (empty, full)                                                                              |
| CH1_PCS_TX_FIFO_ST2               |                                                                                                           |
| CH0_PCS_TX_FIFO_ST3               | Tx fifo status (empty, full)                                                                              |
| CH0_PCS_TX_FIFO_ST2               |                                                                                                           |
| CH1_ACJPOUT                       | Jtag mode for PMA. When PMA in jtag mode, user can force data and ctrl to PMA though JTAG signal directly |

**Table 710: Output Ports (Continued)**

|             |                                                                                                           |
|-------------|-----------------------------------------------------------------------------------------------------------|
| CH0_ACJPOUT | Jtag mode for PMA. When PMA in jtag mode, user can force data and ctrl to PMA though JTAG signal directly |
| CH1_ACJNOUT | Jtag mode for PMA. When PMA in jtag mode, user can force data and ctrl to PMA though JTAG signal directly |
| CH0_ACJNOUT | Jtag mode for PMA. When PMA in jtag mode, user can force data and ctrl to PMA though JTAG signal directly |

## PCSX4

Wrapper of PCSX4 and MPCS. PCS hard IP block is quad-base but each channel has independent ports, controls, registers and setting to support channel-base, dual-channel-base and quad-base usage.

PCSX1 uses one channel of PCSX4. PCSX2 uses two channels of PCSX4.

### Note:

You should not try to use this primitive directly. Instead, use the related IP in IP Catalog. The following information is for reference only.

Architectures supported:

- ▶ LFCPNX
- ▶ LFMXO5T
- ▶ UT24CP

**Table 711: Input Ports**

| Name         | Description                                                      |
|--------------|------------------------------------------------------------------|
| CH3_PMACLKIN | This low speed clock will also drive PMA 'epcs_clkin' clock port |
| CH2_PMACLKIN | This low speed clock will also drive PMA 'epcs_clkin' clock port |
| CH1_PMACLKIN | This low speed clock will also drive PMA 'epcs_clkin' clock port |
| CH0_PMACLKIN | This low speed clock will also drive PMA 'epcs_clkin' clock port |
| CH3_TXCLK    | User interface tx clock input (From FPGA)                        |
| CH2_TXCLK    | User interface tx clock input (From FPGA)                        |

**Table 711: Input Ports (Continued)**

| <b>Name</b>       | <b>Description</b>                                        |
|-------------------|-----------------------------------------------------------|
| CH1_TXCLK         | User interface tx clock input (From FPGA)                 |
| CH0_TXCLK         | User interface tx clock input (From FPGA)                 |
| CH3_RXCLK         | User interface rx clock input (From FPGA)                 |
| CH2_RXCLK         | User interface rx clock input (From FPGA)                 |
| CH1_RXCLK         | User interface rx clock input (From FPGA)                 |
| CH0_RXCLK         | User interface rx clock input (From FPGA)                 |
| CH3_CCCLK         | CTC clock from Fabric                                     |
| CH2_CCCLK         | CTC clock from Fabric                                     |
| CH1_CCCLK         | CTC clock from Fabric                                     |
| CH0_CCCLK         | CTC clock from Fabric                                     |
| TX_ALIGN_CLKIN    | Clock for multi quad usage in TX mode                     |
| RX_ALIGN_CLKIN    | Clock for multi quad usage in RX mode                     |
| CH3_PERSTN        | Fundamental reset. Will trigger PCS auto calibration      |
| CH2_PERSTN        | Fundamental reset. Will trigger PCS auto calibration      |
| CH1_PERSTN        | Fundamental reset. Will trigger PCS auto calibration      |
| CH0_PERSTN        | Fundamental reset. Will trigger PCS auto calibration      |
| CH3_MPCS_TX_URSTN | MPCS core logic reset (TX path), but do not reset PMA phy |
| CH2_MPCS_TX_URSTN | MPCS core logic reset (TX path), but do not reset PMA phy |
| CH1_MPCS_TX_URSTN | MPCS core logic reset (TX path), but do not reset PMA phy |
| CH0_MPCS_TX_URSTN | MPCS core logic reset (TX path), but do not reset PMA phy |
| CH3_MPCS_RX_URSTN | MPCS core logic reset (RX path), but do not reset PMA phy |
| CH2_MPCS_RX_URSTN | MPCS core logic reset (RX path), but do not reset PMA phy |
| CH1_MPCS_RX_URSTN | MPCS core logic reset (RX path), but do not reset PMA phy |
| CH0_MPCS_RX_URSTN | MPCS core logic reset (RX path), but do not reset PMA phy |
| CH3_LMMICLK       | LMMI Clock (from FPGA)                                    |
| CH2_LMMICLK       | LMMI Clock (from FPGA)                                    |
| CH1_LMMICLK       | LMMI Clock (from FPGA)                                    |
| CH0_LMMICLK       | LMMI Clock (from FPGA)                                    |
| CH3_LMMIRESETN    | LMMI Reset                                                |
| CH2_LMMIRESETN    | LMMI Reset                                                |
| CH1_LMMIRESETN    | LMMI Reset                                                |
| CH0_LMMIRESETN    | LMMI Reset                                                |

**Table 711: Input Ports (Continued)**

| <b>Name</b>         | <b>Description</b>                  |
|---------------------|-------------------------------------|
| CH3_LMMIREQUEST     | LMMI start transaction              |
| CH2_LMMIREQUEST     | LMMI start transaction              |
| CH1_LMMIREQUEST     | LMMI start transaction              |
| CH0_LMMIREQUEST     | LMMI start transaction              |
| CH3_LMMIWR_RDN      | LMMI Write=HIGH, LMMI Read=LOW      |
| CH2_LMMIWR_RDN      | LMMI Write=HIGH, LMMI Read=LOW      |
| CH1_LMMIWR_RDN      | LMMI Write=HIGH, LMMI Read=LOW      |
| CH0_LMMIWR_RDN      | LMMI Write=HIGH, LMMI Read=LOW      |
| CH3_LMMIOFFSET[8:0] | LMMI Word Address/Offset            |
| CH2_LMMIOFFSET[8:0] | LMMI Word Address/Offset            |
| CH1_LMMIOFFSET[8:0] | LMMI Word Address/Offset            |
| CH0_LMMIOFFSET[8:0] | LMMI Word Address/Offset            |
| CH3_LMMIWDATA[7:0]  | LMMI write data                     |
| CH2_LMMIWDATA[7:0]  | LMMI write data                     |
| CH1_LMMIWDATA[7:0]  | LMMI write data                     |
| CH0_LMMIWDATA[7:0]  | LMMI write data                     |
| CH3_SDRXP           | Analog RX diffIO                    |
| CH2_SDRXP           | Analog RX diffIO                    |
| CH1_SDRXP           | Analog RX diffIO                    |
| CH0_SDRXP           | Analog RX diffIO                    |
| CH3_SDRXN           | Analog RX diffIO                    |
| CH2_SDRXN           | Analog RX diffIO                    |
| CH1_SDRXN           | Analog RX diffIO                    |
| CH0_SDRXN           | Analog RX diffIO                    |
| CH3_SDREXT          | External resistance                 |
| CH2_SDREXT          | External resistance                 |
| CH1_SDREXT          | External resistance                 |
| CH0_SDREXT          | External resistance                 |
| CH3_SDREFRET        | Channel 3 SD Reference Clock Return |
| CH2_SDREFRET        | Channel 2 SD Reference Clock Return |
| CH1_SDREFRET        | Channel 1 SD Reference Clock Return |
| CH0_SDREFRET        | Channel 0 SD Reference Clock Return |

**Table 711: Input Ports (Continued)**

| Name                     | Description                                                                  |
|--------------------------|------------------------------------------------------------------------------|
| SDQ_REFCLKP              | Refclk of IO EOM pll in one quad                                             |
| SDQ_REFCLKN              | Refclk of IO EOM pll in one quad                                             |
| CH3_AUXCLK               | Auxiliary clock from Fabric for PCIe-PCS core clock                          |
| CH2_AUXCLK               | Auxiliary clock from Fabric for PCIe-PCS core clock                          |
| CH1_AUXCLK               | Auxiliary clock from Fabric for PCIe-PCS core clock                          |
| CH0_AUXCLK               | Auxiliary clock from Fabric for PCIe-PCS core clock                          |
| ALTCLKIN                 | This is from refclk_mux_tree                                                 |
| ALTCLK_SEL               | Selection for alt_clk_in and independent diffIO refclk                       |
| CH3_CLKREQI              | Open drain bidirectional CLKREQ# input                                       |
| CH2_CLKREQI              | Open drain bidirectional CLKREQ# input                                       |
| CH1_CLKREQI              | Open drain bidirectional CLKREQ# input                                       |
| CH0_CLKREQI              | Open drain bidirectional CLKREQ# input                                       |
| TX_LALIGN_IN_UP[7:0]     | The connection signals between Quads for lane alignment across Quad boundary |
| TX_LALIGN_IN_DOWN[7:0]   | The connection signals between Quads for lane alignment across Quad boundary |
| CH3_PIPE_POWER_DOWN[1:0] | Pipe signal open for user, mpcs and ecps sharing                             |
| CH2_PIPE_POWER_DOWN[1:0] | Pipe signal open for user, mpcs and ecps sharing                             |
| CH1_PIPE_POWER_DOWN[1:0] | Pipe signal open for user, mpcs and ecps sharing                             |
| CH0_PIPE_POWER_DOWN[1:0] | Pipe signal open for user, mpcs and ecps sharing                             |
| CH3_PIPE_RATE[1:0]       | Pipe signal open for user, mpcs and ecps sharing                             |
| CH2_PIPE_RATE[1:0]       | Pipe signal open for user, mpcs and ecps sharing                             |
| CH1_PIPE_RATE[1:0]       | Pipe signal open for user, mpcs and ecps sharing                             |
| CH0_PIPE_RATE[1:0]       | Pipe signal open for user, mpcs and ecps sharing                             |
| CH3_PIPE_TXDETECTRX      | Pipe signal open for user, mpcs and ecps sharing                             |
| CH2_PIPE_TXDETECTRX      | Pipe signal open for user, mpcs and ecps sharing                             |
| CH1_PIPE_TXDETECTRX      | Pipe signal open for user, mpcs and ecps sharing                             |
| CH0_PIPE_TXDETECTRX      | Pipe signal open for user, mpcs and ecps sharing                             |
| CH3_PIPE_RX_EQEVAL       | Pipe signal open for user, mpcs and ecps sharing                             |
| CH2_PIPE_RX_EQEVAL       | Pipe signal open for user, mpcs and ecps sharing                             |
| CH1_PIPE_RX_EQEVAL       | Pipe signal open for user, mpcs and ecps sharing                             |
| CH0_PIPE_RX_EQEVAL       | Pipe signal open for user, mpcs and ecps sharing                             |
| CH3_PIPE_INVALID_REQUEST | Pipe signal open for user, mpcs and ecps sharing                             |

**Table 711: Input Ports (Continued)**

| <b>Name</b>                  | <b>Description</b>                               |
|------------------------------|--------------------------------------------------|
| CH2_PIPE_INVALID_REQUEST     | Pipe signal open for user, mpcs and ecps sharing |
| CH1_PIPE_INVALID_REQUEST     | Pipe signal open for user, mpcs and ecps sharing |
| CH0_PIPE_INVALID_REQUEST     | Pipe signal open for user, mpcs and ecps sharing |
| CH3_PIPE_RX_PRESET_HINTEN    | Pipe signal open for user, mpcs and ecps sharing |
| CH2_PIPE_RX_PRESET_HINTEN    | Pipe signal open for user, mpcs and ecps sharing |
| CH1_PIPE_RX_PRESET_HINTEN    | Pipe signal open for user, mpcs and ecps sharing |
| CH0_PIPE_RX_PRESET_HINTEN    | Pipe signal open for user, mpcs and ecps sharing |
| CH3_PIPE_RX_PRESET_HINT[2:0] | Pipe signal open for user, mpcs and ecps sharing |
| CH2_PIPE_RX_PRESET_HINT[2:0] | Pipe signal open for user, mpcs and ecps sharing |
| CH1_PIPE_RX_PRESET_HINT[2:0] | Pipe signal open for user, mpcs and ecps sharing |
| CH0_PIPE_RX_PRESET_HINT[2:0] | Pipe signal open for user, mpcs and ecps sharing |
| CH3_PIPE_RX_POL              | Pipe signal open for user, mpcs and ecps sharing |
| CH2_PIPE_RX_POL              | Pipe signal open for user, mpcs and ecps sharing |
| CH1_PIPE_RX_POL              | Pipe signal open for user, mpcs and ecps sharing |
| CH0_PIPE_RX_POL              | Pipe signal open for user, mpcs and ecps sharing |
| CH3_PIPE_TX_CLKREQ           | Pipe signal open for user, mpcs and ecps sharing |
| CH2_PIPE_TX_CLKREQ           | Pipe signal open for user, mpcs and ecps sharing |
| CH1_PIPE_TX_CLKREQ           | Pipe signal open for user, mpcs and ecps sharing |
| CH0_PIPE_TX_CLKREQ           | Pipe signal open for user, mpcs and ecps sharing |
| CH3_PIPE_TXCOMM_DIS          | Pipe signal open for user, mpcs and ecps sharing |
| CH2_PIPE_TXCOMM_DIS          | Pipe signal open for user, mpcs and ecps sharing |
| CH1_PIPE_TXCOMM_DIS          | Pipe signal open for user, mpcs and ecps sharing |
| CH0_PIPE_TXCOMM_DIS          | Pipe signal open for user, mpcs and ecps sharing |
| CH3_PIPE_RXEI_DIS            | Pipe signal open for user, mpcs and ecps sharing |
| CH2_PIPE_RXEI_DIS            | Pipe signal open for user, mpcs and ecps sharing |
| CH1_PIPE_RXEI_DIS            | Pipe signal open for user, mpcs and ecps sharing |
| CH0_PIPE_RXEI_DIS            | Pipe signal open for user, mpcs and ecps sharing |
| CH3_PIPE_L1PMSSSEN           | Pipe signal open for user, mpcs and ecps sharing |
| CH2_PIPE_L1PMSSSEN           | Pipe signal open for user, mpcs and ecps sharing |
| CH1_PIPE_L1PMSSSEN           | Pipe signal open for user, mpcs and ecps sharing |
| CH0_PIPE_L1PMSSSEN           | Pipe signal open for user, mpcs and ecps sharing |
| CH3_PIPE_L1X_ENTRY_REQ       | Pipe signal open for user, mpcs and ecps sharing |

**Table 711: Input Ports (Continued)**

| Name                                | Description                                      |
|-------------------------------------|--------------------------------------------------|
| CH2_PIPE_L1X_ENTRY_REQ              | Pipe signal open for user, mpcs and ecps sharing |
| CH1_PIPE_L1X_ENTRY_REQ              | Pipe signal open for user, mpcs and ecps sharing |
| CH0_PIPE_L1X_ENTRY_REQ              | Pipe signal open for user, mpcs and ecps sharing |
| CH3_PIPE_TX_SWING                   | Pipe signal open for user, mpcs and ecps sharing |
| CH2_PIPE_TX_SWING                   | Pipe signal open for user, mpcs and ecps sharing |
| CH1_PIPE_TX_SWING                   | Pipe signal open for user, mpcs and ecps sharing |
| CH0_PIPE_TX_SWING                   | Pipe signal open for user, mpcs and ecps sharing |
| CH3_PIPE_TX_MARGIN[2:0]             | Pipe signal open for user, mpcs and ecps sharing |
| CH2_PIPE_TX_MARGIN[2:0]             | Pipe signal open for user, mpcs and ecps sharing |
| CH1_PIPE_TX_MARGIN[2:0]             | Pipe signal open for user, mpcs and ecps sharing |
| CH0_PIPE_TX_MARGIN[2:0]             | Pipe signal open for user, mpcs and ecps sharing |
| CH3_PIPE_TX_DEEMPH[15:0]            | Pipe signal open for user, mpcs and ecps sharing |
| CH2_PIPE_TX_DEEMPH[15:0]            | Pipe signal open for user, mpcs and ecps sharing |

| CH1_PIPE_RX_EQ_EVAL_FEEDBACK_DIR_LL[5:0] | PHY provides pre/post coefficient up/dn guidance on pipe_rx_eq_eval_feedback_dir coincident with pipe_phy_status == 1                                       |
| CH0_PIPE_RX_EQ_EVAL_FEEDBACK_DIR_LL[5:0] | PHY provides pre/post coefficient up/dn guidance on pipe_rx_eq_eval_feedback_dir coincident with pipe_phy_status == 1                                       |
| CH3_PIPE_PHY_STATUS_LL                   | Set to 1 by PHY for one clock to communicate Tx detection, rate change, power down change, and equalization evaluation completion                           |
| CH2_PIPE_PHY_STATUS_LL                   | Set to 1 by PHY for one clock to communicate Tx detection, rate change, power down change, and equalization evaluation completion                           |
| CH1_PIPE_PHY_STATUS_LL                   | Set to 1 by PHY for one clock to communicate Tx detection, rate change, power down change, and equalization evaluation completion                           |
| CH0_PIPE_PHY_STATUS_LL                   | Set to 1 by PHY for one clock to communicate Tx detection, rate change, power down change, and equalization evaluation completion                           |
| CH3_PIPE_RX_ELEC_IDLE_LL                 | PIPE Rx Electrical Idle. 1==Idle, 0==Active. Required valid at 2.5G. Allowance for inaccuracy at >= 5G. See core User Guide                                 |

**Table 712: Output Ports (Continued)**

| Name                      | Description                                                                                                                                                  |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CH2_PIPE_RX_ELEC_IDLE_LL  | PIPE Rx Electrical Idle. 1==Idle, 0==Active. Required valid at 2.5G. Allowance for inaccuracy at >= 5G. See core User Guide                                  |
| CH1_PIPE_RX_ELEC_IDLE_LL  | PIPE Rx Electrical Idle. 1==Idle, 0==Active. Required valid at 2.5G. Allowance for inaccuracy at >= 5G. See core User Guide                                  |
| CH0_PIPE_RX_ELEC_IDLE_LL  | PIPE Rx Electrical Idle. 1==Idle, 0==Active. Required valid at 2.5G. Allowance for inaccuracy at >= 5G. See core User Guide                                  |
| CH3_PIPE_RX_CLKREQ_N_LL   | Open drain CLKREQ# pin input. Current value of open drain CLKREQ# pin. 1==Request to disable PCIe reference clock. 0==Request to enable PCIe reference clock |
| CH2_PIPE_RX_CLKREQ_N_LL   | Open drain CLKREQ# pin input. Current value of open drain CLKREQ# pin. 1==Request to disable PCIe reference clock. 0==Request to enable PCIe reference clock |
| CH1_PIPE_RX_CLKREQ_N_LL   | Open drain CLKREQ# pin input. Current value of open drain CLKREQ# pin. 1==Request to disable PCIe reference clock. 0==Request to enable PCIe reference clock |
| CH0_PIPE_RX_CLKREQ_N_LL   | Open drain CLKREQ# pin input. Current value of open drain CLKREQ# pin. 1==Request to disable PCIe reference clock. 0==Request to enable PCIe reference clock |
| CH3_PIPE_LOCAL_FS_LL[5:0] | Local PHY FS value. Captured on first pipe_phy_status == 1 after reset deassertion                                                                           |
| CH2_PIPE_LOCAL_FS_LL[5:0] | Local PHY FS value. Captured on first pipe_phy_status == 1 after reset deassertion                                                                           |
| CH1_PIPE_LOCAL_FS_LL[5:0] | Local PHY FS value. Captured on first pipe_phy_status == 1 after reset deassertion                                                                           |
| CH0_PIPE_LOCAL_FS_LL[5:0] | Local PHY FS value. Captured on first pipe_phy_status == 1 after reset deassertion                                                                           |
| CH3_PIPE_LOCAL_LF_LL[5:0] | Local PHY LF value. Captured on first pipe_phy_status == 1 after reset deassertion                                                                           |
| CH2_PIPE_LOCAL_LF_LL[5:0] | Local PHY LF value. Captured on first pipe_phy_status == 1 after reset deassertion                                                                           |
| CH1_PIPE_LOCAL_LF_LL[5:0] | Local PHY LF value. Captured on first pipe_phy_status == 1 after reset deassertion                                                                           |
| CH0_PIPE_LOCAL_LF_LL[5:0] | Local PHY LF value. Captured on first pipe_phy_status == 1 after reset deassertion                                                                           |

**Table 712: Output Ports (Continued)**

| Name                                       | Description                                                                                                                                                                                                                                                                                               |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CH3_PIPE_LOCAL_GET_TX_COEF_VALID_LL        | Local Tx coefficient valid: This signal is a per-lane signal which is used by the PHY layer to indicate the required preset to coefficient mapping is valid on pipe_local_tx_pset_coef[17:0] output signal. This signal is used by the PHY layer only when the pipe_getlocal_pset_coef signal is asserted |
| CH2_PIPE_LOCAL_GET_TX_COEF_VALID_LL        | Local Tx coefficient valid: This signal is a per-lane signal which is used by the PHY layer to indicate the required preset to coefficient mapping is valid on pipe_local_tx_pset_coef[17:0] output signal. This signal is used by the PHY layer only when the pipe_getlocal_pset_coef signal is asserted |
| CH1_PIPE_LOCAL_GET_TX_COEF_VALID_LL        | Local Tx coefficient valid: This signal is a per-lane signal which is used by the PHY layer to indicate the required preset to coefficient mapping is valid on pipe_local_tx_pset_coef[17:0] output signal. This signal is used by the PHY layer only when the pipe_getlocal_pset_coef signal is asserted |
| CH0_PIPE_LOCAL_GET_TX_COEF_VALID_LL        | Local Tx coefficient valid: This signal is a per-lane signal which is used by the PHY layer to indicate the required preset to coefficient mapping is valid on pipe_local_tx_pset_coef[17:0] output signal. This signal is used by the PHY layer only when the pipe_getlocal_pset_coef signal is asserted |
| CH3_PIPE_LOCAL_GET_TX_PRESET_COEF_LL[17:0] | Local Tx coefficient mapping: This signal is a per-lane signal which is used by the PHY layer to indicate the coefficient value corresponding to the required preset                                                                                                                                      |
| CH2_PIPE_LOCAL_GET_TX_PRESET_COEF_LL[17:0] | Local Tx coefficient mapping: This signal is a per-lane signal which is used by the PHY layer to indicate the coefficient value corresponding to the required preset                                                                                                                                      |
| CH1_PIPE_LOCAL_GET_TX_PRESET_COEF_LL[17:0] | Local Tx coefficient mapping: This signal is a per-lane signal which is used by the PHY layer to indicate the coefficient value corresponding to the required preset                                                                                                                                      |
| CH0_PIPE_LOCAL_GET_TX_PRESET_COEF_LL[17:0] | Local Tx coefficient mapping: This signal is a per-lane signal which is used by the PHY layer to indicate the coefficient value corresponding to the required preset                                                                                                                                      |
| CH3_PIPE_TX_DATA_ENABLE_LL                 | PIPE Tx Data Enable. Tx Data is taken by PHY when pipe_tx_data_enable==1. Tx Data outputs hold their value when pipe_tx_data_enable==0                                                                                                                                                                    |
| CH2_PIPE_TX_DATA_ENABLE_LL                 | PIPE Tx Data Enable. Tx Data is taken by PHY when pipe_tx_data_enable==1. Tx Data outputs hold their value when pipe_tx_data_enable==0                                                                                                                                                                    |
| CH1_PIPE_TX_DATA_ENABLE_LL                 | PIPE Tx Data Enable. Tx Data is taken by PHY when pipe_tx_data_enable==1. Tx Data outputs hold their value when pipe_tx_data_enable==0                                                                                                                                                                    |

**Table 712: Output Ports (Continued)**

| Name                            | Description                                                                                                                            |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| CH0_PIPE_TX_DATA_ENABLE_LL      | PIPE Tx Data Enable. Tx Data is taken by PHY when pipe_tx_data_enable==1. Tx Data outputs hold their value when pipe_tx_data_enable==0 |
| CH3_PIPE_RX_DATAEN_LL           | PIPE Rx Data Enable. Data is provided by PHY when pipe_rx_data_enable==1. Rx Data inputs are unused when pipe_rx_data_enable==0        |
| CH2_PIPE_RX_DATAEN_LL           | PIPE Rx Data Enable. Data is provided by PHY when pipe_rx_data_enable==1. Rx Data inputs are unused when pipe_rx_data_enable==0        |
| CH1_PIPE_RX_DATAEN_LL           | PIPE Rx Data Enable. Data is provided by PHY when pipe_rx_data_enable==1. Rx Data inputs are unused when pipe_rx_data_enable==0        |
| CH0_PIPE_RX_DATAEN_LL           | PIPE Rx Data Enable. Data is provided by PHY when pipe_rx_data_enable==1. Rx Data inputs are unused when pipe_rx_data_enable==0        |
| CH3_PIPE_RX_DATA_VALID_LL       | PIPE Rx Data Valid for >= 8G only. 1==Data is valid. 0==Data is invalid. De-asserted only to compensate for 128b130b encoding          |
| CH2_PIPE_RX_DATA_VALID_LL       | PIPE Rx Data Valid for >= 8G only. 1==Data is valid. 0==Data is invalid. De-asserted only to compensate for 128b130b encoding          |
| CH1_PIPE_RX_DATA_VALID_LL       | PIPE Rx Data Valid for >= 8G only. 1==Data is valid. 0==Data is invalid. De-asserted only to compensate for 128b130b encoding          |
| CH0_PIPE_RX_DATA_VALID_LL       | PIPE Rx Data Valid for >= 8G only. 1==Data is valid. 0==Data is invalid. De-asserted only to compensate for 128b130b encoding          |
| CH3_PIPE_RX_START_BLOCK_LL      | PIPE Rx Start Block. 1==Start of block. 0==Otherwise. All blocks received are 128-bit except SKP OS which is variable size             |
| CH2_PIPE_RX_START_BLOCK_LL      | PIPE Rx Start Block. 1==Start of block. 0==Otherwise. All blocks received are 128-bit except SKP OS which is variable size             |
| CH1_PIPE_RX_START_BLOCK_LL      | PIPE Rx Start Block. 1==Start of block. 0==Otherwise. All blocks received are 128-bit except SKP OS which is variable size             |
| CH0_PIPE_RX_START_BLOCK_LL      | PIPE Rx Start Block. 1==Start of block. 0==Otherwise. All blocks received are 128-bit except SKP OS which is variable size             |
| CH3_PIPE_RX_SYNC_HEADER_LL[1:0] | PIPE Rx Sync Header. When pipe_rx_start_block==1, indicates the block type: 01==Ordered Set or 10==Data                                |
| CH2_PIPE_RX_SYNC_HEADER_LL[1:0] | PIPE Rx Sync Header. When pipe_rx_start_block==1, indicates the block type: 01==Ordered Set or 10==Data                                |

**Table 712: Output Ports (Continued)**

| Name                            | Description                                                                                                                                 |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| CH1_PIPE_RX_SYNC_HEADER_LL[1:0] | PIPE Rx Sync Header. When pipe_rx_start_block==1, indicates the block type: 01==Ordered Set or 10==Data                                     |
| CH0_PIPE_RX_SYNC_HEADER_LL[1:0] | PIPE Rx Sync Header. When pipe_rx_start_block==1, indicates the block type: 01==Ordered Set or 10==Data                                     |
| CH3_PIPE_RX_DATA_LL[31:0]       | Pipe RX data                                                                                                                                |
| CH2_PIPE_RX_DATA_LL[31:0]       | Pipe RX data                                                                                                                                |
| CH1_PIPE_RX_DATA_LL[31:0]       | Pipe RX data                                                                                                                                |
| CH0_PIPE_RX_DATA_LL[31:0]       | Pipe RX data                                                                                                                                |
| CH3_PIPE_RX_DATAK_LL[3:0]       | PIPE Rx Data K indicator for 8b10b.                                                                                                         |
| CH2_PIPE_RX_DATAK_LL[3:0]       | PIPE Rx Data K indicator for 8b10b.                                                                                                         |
| CH1_PIPE_RX_DATAK_LL[3:0]       | PIPE Rx Data K indicator for 8b10b.                                                                                                         |
| CH0_PIPE_RX_DATAK_LL[3:0]       | PIPE Rx Data K indicator for 8b10b.                                                                                                         |
| CH3_PIPE_RX_VALID_LL            | 1==PHY is locked to Rx data stream and data is valid - use pipe_rx_data. 0==PHY is not locked - ignore pipe_rx_data                         |
| CH2_PIPE_RX_VALID_LL            | 1==PHY is locked to Rx data stream and data is valid - use pipe_rx_data. 0==PHY is not locked - ignore pipe_rx_data                         |
| CH1_PIPE_RX_VALID_LL            | 1==PHY is locked to Rx data stream and data is valid - use pipe_rx_data. 0==PHY is not locked - ignore pipe_rx_data                         |
| CH0_PIPE_RX_VALID_LL            | 1==PHY is locked to Rx data stream and data is valid - use pipe_rx_data. 0==PHY is not locked - ignore pipe_rx_data                         |
| CH3_PIPE_RX_STATUS_LL[2:0]      | PIPE Rx Status. 000=OK, 001/010 SKP Add/Del (unused), 011=Receiver Detected, 100/111 encoding error, 101/110 over/underflow error           |
| CH2_PIPE_RX_STATUS_LL[2:0]      | PIPE Rx Status. 000=OK, 001/010 SKP Add/Del (unused), 011=Receiver Detected, 100/111 encoding error, 101/110 over/underflow error           |
| CH1_PIPE_RX_STATUS_LL[2:0]      | PIPE Rx Status. 000=OK, 001/010 SKP Add/Del (unused), 011=Receiver Detected, 100/111 encoding error, 101/110 over/underflow error           |
| CH0_PIPE_RX_STATUS_LL[2:0]      | PIPE Rx Status. 000=OK, 001/010 SKP Add/Del (unused), 011=Receiver Detected, 100/111 encoding error, 101/110 over/underflow error           |
| PIPE_PCLKOUT_LL[3:0]            | Pipe clock connect to harden PCIe_LL. connect to pipe_pclkout_LL[0] goes to clk_250_i_link0, and pipe_pclkout_LL[3] goes to clk_250_i_link1 |
| CH3_PIPE_WIDTH_2G5[1:0]         | Pipe signal open for user, mpcs and ecps sharing                                                                                            |

**Table 712: Output Ports (Continued)**

| Name                                  | Description                                      |
|---------------------------------------|--------------------------------------------------|
| CH2_PIPE_WIDTH_2G5[1:0]               | Pipe signal open for user, mpcs and ecps sharing |
| CH1_PIPE_WIDTH_2G5[1:0]               | Pipe signal open for user, mpcs and ecps sharing |
| CH0_PIPE_WIDTH_2G5[1:0]               | Pipe signal open for user, mpcs and ecps sharing |
| CH3_PIPE_RXEQ_DIR_PCS_RX_DATA[3:0]    | Pipe signal open for user, mpcs and ecps sharing |
| CH2_PIPE_RXEQ_DIR_PCS_RX_DATA[3:0]    | Pipe signal open for user, mpcs and ecps sharing |
| CH1_PIPE_RXEQ_DIR_PCS_RX_DATA[3:0]    | Pipe signal open for user, mpcs and ecps sharing |
| CH0_PIPE_RXEQ_DIR_PCS_RX_DATA[3:0]    | Pipe signal open for user, mpcs and ecps sharing |
| CH3_PIPE_RXEQ_DIR_PCS_RX_FIFO_ST[1:0] | Pipe signal open for user, mpcs and ecps sharing |
| CH2_PIPE_RXEQ_DIR_PCS_RX_FIFO_ST[1:0] | Pipe signal open for user, mpcs and ecps sharing |
| CH1_PIPE_RXEQ_DIR_PCS_RX_FIFO_ST[1:0] | Pipe signal open for user, mpcs and ecps sharing |
| CH0_PIPE_RXEQ_DIR_PCS_RX_FIFO_ST[1:0] | Pipe signal open for user, mpcs and ecps sharing |
| CH3_PIPE_LOCAL_FS_PCS_RX_DATA[5:0]    | Pipe signal open for user, mpcs and ecps sharing |
| CH2_PIPE_LOCAL_FS_PCS_RX_DATA[5:0]    | Pipe signal open for user, mpcs and ecps sharing |
| CH1_PIPE_LOCAL_FS_PCS_RX_DATA[5:0]    | Pipe signal open for user, mpcs and ecps sharing |
| CH0_PIPE_LOCAL_FS_PCS_RX_DATA[5:0]    | Pipe signal open for user, mpcs and ecps sharing |
| CH3_PIPE_LOCAL_LF_PCS_RX_DATA[5:0]    | Pipe signal open for user, mpcs and ecps sharing |
| CH2_PIPE_LOCAL_LF_PCS_RX_DATA[5:0]    | Pipe signal open for user, mpcs and ecps sharing |
| CH1_PIPE_LOCAL_LF_PCS_RX_DATA[5:0]    | Pipe signal open for user, mpcs and ecps sharing |
| CH0_PIPE_LOCAL_LF_PCS_RX_DATA[5:0]    | Pipe signal open for user, mpcs and ecps sharing |
| CH3_PIPE_LOCAL_GET_TX_COEF_VLD        | Pipe signal open for user, mpcs and ecps sharing |
| CH2_PIPE_LOCAL_GET_TX_COEF_VLD        | Pipe signal open for user, mpcs and ecps sharing |
| CH1_PIPE_LOCAL_GET_TX_COEF_VLD        | Pipe signal open for user, mpcs and ecps sharing |
| CH0_PIPE_LOCAL_GET_TX_COEF_VLD        | Pipe signal open for user, mpcs and ecps sharing |
| CH3_PIPE_TX_DATA_EN                   | Pipe signal open for user, mpcs and ecps sharing |
| CH2_PIPE_TX_DATA_EN                   | Pipe signal open for user, mpcs and ecps sharing |
| CH1_PIPE_TX_DATA_EN                   | Pipe signal open for user, mpcs and ecps sharing |
| CH0_PIPE_TX_DATA_EN                   | Pipe signal open for user, mpcs and ecps sharing |
| CH3_PIPE_RX_DATAK_PCS_RX_DATA[3:0]    | Pipe signal open for user, mpcs and ecps sharing |
| CH2_PIPE_RX_DATAK_PCS_RX_DATA[3:0]    | Pipe signal open for user, mpcs and ecps sharing |
| CH1_PIPE_RX_DATAK_PCS_RX_DATA[3:0]    | Pipe signal open for user, mpcs and ecps sharing |
| CH0_PIPE_RX_DATAK_PCS_RX_DATA[3:0]    | Pipe signal open for user, mpcs and ecps sharing |
| CH3_PCS_RX_DATA[5:0]                  | Dedicated ports used for pcs rx data             |

**Table 712: Output Ports (Continued)**

| Name                    | Description                                                                                               |
|-------------------------|-----------------------------------------------------------------------------------------------------------|
| CH2_PCS_RX_DATA[5:0]    | Dedicated ports used for pcs rx data                                                                      |
| CH1_PCS_RX_DATA[5:0]    | Dedicated ports used for pcs rx data                                                                      |
| CH0_PCS_RX_DATA[5:0]    | Dedicated ports used for pcs rx data                                                                      |
| CH3_PCS_RX_HI_BER       | The high level of this signal indicates High BER is detected                                              |
| CH2_PCS_RX_HI_BER       | The high level of this signal indicates High BER is detected                                              |
| CH1_PCS_RX_HI_BER       | The high level of this signal indicates High BER is detected                                              |
| CH0_PCS_RX_HI_BER       | The high level of this signal indicates High BER is detected                                              |
| CH3_PCS_RX_BLK_LOCK     | The high level of this signal indicates the block lock is achieved                                        |
| CH2_PCS_RX_BLK_LOCK     | The high level of this signal indicates the block lock is achieved                                        |
| CH1_PCS_RX_BLK_LOCK     | The high level of this signal indicates the block lock is achieved                                        |
| CH0_PCS_RX_BLK_LOCK     | The high level of this signal indicates the block lock is achieved                                        |
| CH3_PCS_TX_FIFO_ST[1:0] | TX fifo status (empty, full)                                                                              |
| CH2_PCS_TX_FIFO_ST[1:0] | TX fifo status (empty, full)                                                                              |
| CH1_PCS_TX_FIFO_ST[1:0] | TX fifo status (empty, full)                                                                              |
| CH0_PCS_TX_FIFO_ST[1:0] | TX fifo status (empty, full)                                                                              |
| CH3_ACJPOUT             | Jtag mode for PMA. When PMA in jtag mode, user can force data and ctrl to PMA though JTAG signal directly |
| CH2_ACJPOUT             | Jtag mode for PMA. When PMA in jtag mode, user can force data and ctrl to PMA though JTAG signal directly |
| CH1_ACJPOUT             | Jtag mode for PMA. When PMA in jtag mode, user can force data and ctrl to PMA though JTAG signal directly |
| CH0_ACJPOUT             | Jtag mode for PMA. When PMA in jtag mode, user can force data and ctrl to PMA though JTAG signal directly |
| CH3_ACJNOUT             | Jtag mode for PMA. When PMA in jtag mode, user can force data and ctrl to PMA though JTAG signal directly |
| CH2_ACJNOUT             | Jtag mode for PMA. When PMA in jtag mode, user can force data and ctrl to PMA though JTAG signal directly |
| CH1_ACJNOUT             | Jtag mode for PMA. When PMA in jtag mode, user can force data and ctrl to PMA though JTAG signal directly |
| CH0_ACJNOUT             | Jtag mode for PMA. When PMA in jtag mode, user can force data and ctrl to PMA though JTAG signal directly |

## PDP4K

4 kb Pseudo-dual Port Block RAM

- ▶ iCE40 UltraPlus

**Table 713: Input Ports**

| Name   | Range | Description                           |
|--------|-------|---------------------------------------|
| DI     | 15:0  | Data in                               |
| ADW    | 10:0  | Write address                         |
| ADR    | 10:0  | Read address                          |
| CKW    | 1     | Write clock                           |
| CKR    | 1     | Read clock                            |
| CEW    | 1     | Write clock enable, active high       |
| CER    | 1     | Read clock enable, active high        |
| RE     | 1     | Read enable, active high              |
| WE     | 1     | Write enable, active high             |
| MASK_N | 15:0  | Per-bit write enable mask, active low |

**Note:**

MASK\_N input is functional only for the 16-bit mode. PDP4K is used to configure 2-, 4-, 8- or 16-bit mode EBR operations. MASK\_N functions only when it is configured to 16-bit data.

**Table 714: Output Ports**

| Name | Range | Description |
|------|-------|-------------|
| DO   | 15:0  | Data output |

**Table 715: Parameters**

| Name      | Values                                         |
|-----------|------------------------------------------------|
| INITVAL_0 | "0x00000000000000000000000000000000" (default) |
| INITVAL_1 | "0x00000000000000000000000000000000" (default) |
| INITVAL_2 | "0x00000000000000000000000000000000" (default) |
| INITVAL_3 | "0x00000000000000000000000000000000" (default) |
| INITVAL_4 | "0x00000000000000000000000000000000" (default) |
| INITVAL_5 | "0x00000000000000000000000000000000" (default) |
| INITVAL_6 | "0x00000000000000000000000000000000" (default) |
| INITVAL_7 | "0x00000000000000000000000000000000" (default) |
| INITVAL_8 | "0x00000000000000000000000000000000" (default) |
| INITVAL_9 | "0x00000000000000000000000000000000" (default) |
| INITVAL_A | "0x00000000000000000000000000000000" (default) |
| INITVAL_B | "0x00000000000000000000000000000000" (default) |
| INITVAL_C | "0x00000000000000000000000000000000" (default) |
| INITVAL_D | "0x00000000000000000000000000000000" (default) |
| INITVAL_E | "0x00000000000000000000000000000000" (default) |
| INITVAL_F | "0x00000000000000000000000000000000" (default) |

**Table 715: Parameters (Continued)**

| Name         | Values                                           |
|--------------|--------------------------------------------------|
| DATA_WIDTH_W | "2" (default), "4", "8", "16" (Write data width) |
| DATA_WIDTH_R | "2" (default), "4", "8", "16" (Read data width)  |

**Rules & Restrictions:**

See EBR\_B section. The same rules regard port mapping and initial value parameter conversion for EBR\_B apply for PDP4K (only difference is that for EBR\_B → INIT\_#, while for PDP4K → INITVAL\_#).

| RESETMODE               | "SYNC" ( <i>default</i> )<br>"ASYNC"                                                    | Reset sync/async control                                    |
| GSR                     | "ENABLED" ( <i>default</i> )<br>"DISABLED"                                              | Enable global set/reset for the output registers            |
| ECC                     | "DISABLED" ( <i>default</i> )<br>"ENABLED"                                              | Enable ECC                                                  |
| INITVAL_00...INITVAL_3F | Hex string, 320 bits, must include the "0x" prefix                                      | EBR initialization data                                     |
| CSDECODE_W              | "000" ( <i>default</i> )<br>"001"<br>"010"<br>"011"<br>"100"<br>"101"<br>"110"<br>"111" | Write chip select active level, 0=active high 1=active low  |
| CSDECODE_R              | "000" ( <i>default</i> )<br>"001"<br>"010"<br>"011"<br>"100"<br>"101"<br>"110"<br>"111" | Read chip select active setting, 0=active high 1=active low |

**Table 718: Parameters (Continued)**

| Name              | Values                                                | Description                                           |
|-------------------|-------------------------------------------------------|-------------------------------------------------------|
| ASYNC_RST_RELEASE | "SYNC" ( <i>default</i> )<br>"ASYNC"                  | Reset release sync/async control                      |
| INIT_DATA         | "STATIC" ( <i>default</i> )<br>"DYNAMIC"<br>"NO_INIT" | Defines whether or not the memory file can be updated |

**Note:**

It is **not** legal to drive the read and write clock such that their active edges switch simultaneously.

All inputs (except the register control signals) and all outputs are registered in the following manner:

Port assignments for different data widths will follow the table below:

| Data Width | Input Data | Output Data | Write Address<br>(MSB to LSB) | Read Address<br>(MSB to LSB) |
|------------|------------|-------------|-------------------------------|------------------------------|
| 16Kx1      | DI[0]      | DO[0]       | ADW[13:0]                     | ADR[13:0]                    |
| 8Kx2       | DI[1:0]    | DO[1:0]     | ADW[13:1]                     | ADR[13:1]                    |
| 4Kx4       | DI[3:0]    | DO[3:0]     | ADW[13:2]                     | ADR[13:2]                    |
| 2Kx9       | DI[8:0]    | DO[8:0]     | ADW[13:3]                     | ADR[13:3]                    |
| 1Kx18      | DI[17:0]   | DO[17:0]    | ADW[13:4]                     | ADR[13:4]                    |
| 512x36     | DI[35:0]   | DO[35:0]    | ADW[13:4]                     | ADR[13:4]                    |

For data widths that do not use all available address bits, the unused bits **must** be tied high for proper functionality.

**Table 719: Input Ports**

| Name | Range | Type         | Active State | Description                            |
|------|-------|--------------|--------------|----------------------------------------|
| DI   | 71:0  | Data         | Active High  | Data Inputs                            |
| ADW  | 14:0  | Addr         | Active High  | Write Address                          |
| ADR  | 14:0  | Addr         | Active High  | Read Address                           |
| CLKW | 1     | Clock        | Rising Edge  | Write Clock Input                      |
| CLKR | 1     | Clock        | Rising Edge  | Read Clock Input                       |
| CEW  | 1     | Clock Enable | Active High  | Write Clock Enable                     |
| CER  | 1     | Clock Enable | Active High  | Read Clock Enable                      |
| OCE  | 1     | Clock Enable | Active High  | Output Register Clock Enable           |
| BE6  | 1     | Control      | Active High  | Byte enable for x72/x64 highest-1 byte |
| BE7  | 1     | Control      | Active High  | Byte enable for x72/x64 highest byte   |
| CSW  | 2:0   | Control      | Active High  | Write Cascade Select                   |
| CSR  | 2:0   | Control      | Active High  | Read Cascade Select                    |
| RST  | 1     | Reset        | Active High  | Read output registers reset            |

**Table 720: Output Ports**

| Name      | Range | Type | Description                       |
|-----------|-------|------|-----------------------------------|
| DO        | 71:0  | Data | Data Output                       |
| ONEBITERR | 1     | Flag | ECC error flag (single bit error) |
| TWOBITERR | 1     | Flag | ECC error flag (two bit error)    |

**Table 721: Parameters**

| Name         | Values                                                                                       | Description                                      |
|--------------|----------------------------------------------------------------------------------------------|--------------------------------------------------|
| DATA_WIDTH_W | "X72" (default)<br>"X64" (virtual for ECC)<br>"X36"<br>"X18"<br>"X9"<br>"X4"<br>"X2"<br>"X1" | Specifies the Data Word Width                    |
| DATA_WIDTH_R | "X72" (default)<br>"X64"<br>"X36"<br>"X18"<br>"X9"<br>"X4"<br>"X2"<br>"X1"                   | Read port width                                  |
| OUTREG       | "BYPASSED" (default)<br>"USED"                                                               | Register output                                  |
| RESETMODE    | "SYNC" (default)<br>"ASYNC"                                                                  | Reset sync/async control                         |
| GSR          | "ENABLED" (default)<br>"DISABLED"                                                            | Enable global set/reset for the output registers |

**Table 721: Parameters (Continued)**

| <b>Name</b>             | <b>Values</b>                                                                  | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| ECC                     | "DISABLED" (default)<br>"ENABLED"                                              | Enable ECC                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| INITVAL_00...INITVAL_7F | Hex string, 320 bits, must include the "0x" prefix                             | Initialization value                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| INIT_DATA               | "STATIC" (default)<br>"DYNAMIC"                                                | <p>Specifies if the initialization data (as defined by the INITVAL parameters) may be changed after the synthesis stage.</p> <p>When INIT_DATA=STATIC, it is assumed that the initialization data will not change after synthesis, so an optimization to reduce the bitstream size can be applied.</p> <p>When INIT_DATA=DYNAMIC it is assumed that the initialization data may change after synthesis, so the aforementioned optimization is disabled.</p> |

**Note:**

If writing and reading at the same address simultaneously, the behavior is not guaranteed (i.e. either the read or write may happen first).

**PDPSC16K**

16Kb Pseudo Dual Port Single Clock Block RAM

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 722: Input Ports**

| Name | Range | Description   |
|------|-------|---------------|
| DI   | 35:0  | Data in       |
| ADW  | 13:0  | Write address |
| ADR  | 13:0  | Read address  |

**Table 722: Input Ports (Continued)**

| Name | Range | Description           |
|------|-------|-----------------------|

| INITVAL_00...INITVAL_3F | Hex string, 320 bits, must include the "0x" prefix                             | EBR Initialization data                                             |
| CSDECODE_W              | "000" (default)<br>"001"<br>"010"<br>"011"<br>"100"<br>"101"<br>"110"<br>"111" | Write chip select active setting<br>0: active high<br>1: active low |
| CSDECODE_R              | "000" (default)<br>"001"<br>"010"<br>"011"<br>"100"<br>"101"<br>"110"<br>"111" | Read chip select active setting<br>0: active high<br>1: active low  |
| ASYNC_RST_RELEASE       | "SYNC" (default)<br>"ASYNC"                                                    | Reset release sync/async control                                    |
| INIT_DATA               | "STATIC" (default)<br>"DYNAMIC"<br>"NO_INIT"                                   | Defines whether or not the memory file can be updated               |

**Note:**

When a pseudo-dual port RAM is desired, if only a single clock is required it is preferred to use PDPSC16K over PDP16K as performance in hardware will be faster with PDPSC16K.

All inputs (except the register control signals) and all outputs are registered in the following manner:

Port assignments for different data widths will follow the table below:

| Data Width | Input Data | Output Data | Write Address<br>(MSB to LSB) | Read Address<br>(MSB to LSB) |
|------------|------------|-------------|-------------------------------|------------------------------|
| 16Kx1      | DI[0]      | DO[0]       | ADW[13:0]                     | ADR[13:0]                    |
| 8Kx2       | DI[1:0]    | DO[1:0]     | ADW[13:1]                     | ADR[13:1]                    |
| 4Kx4       | DI[3:0]    | DO[3:0]     | ADW[13:2]                     | ADR[13:2]                    |
| 2Kx9       | DI[8:0]    | DO[8:0]     | ADW[13:3]                     | ADR[13:3]                    |
| 1Kx18      | DI[17:0]   | DO[17:0]    | ADW[13:4]                     | ADR[13:4]                    |
| 512x36     | DI[35:0]   | DO[35:0]    | ADW[13:4]                     | ADR[13:4]                    |

For data widths that don't use all available address bits, the unused bits must be tied high for proper functionality.

## PDPSC32K

32Kb Pseudo Dual Port Single Clock Block RAM

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 725: Input Ports**

| Name | Range | Type  | Active State | Description              |
|------|-------|-------|--------------|--------------------------|
| DI   | 71:0  | Data  | Active High  | Data Inputs              |
| ADW  | 14:0  | Addr  | Active High  | Write Address            |
| ADR  | 14:0  | Addr  | Active High  | Read Address             |
| CLK  | 1     | Clock | Rising Edge  | Write & Read Clock Input |

**Table 725: (Continued)Input Ports**

| Name | Range | Type         | Active State | Description                            |
|------|-------|--------------|--------------|----------------------------------------|
| CEW  | 1     | Clock Enable | Active High  | Write Clock Enable                     |
| CER  | 1     | Clock Enable | Active High  | Read Clock Enable                      |
| OCE  | 1     | Clock Enable | Active High  | Output register Clock Enable           |
| BE6  | 1     | Control      | Active High  | Byte enable for x72/x64 highest-1 byte |
| BE7  | 1     | Control      | Active High  | Byte enable for x72/x64 highest byte   |
| CSW  | 2:0   | Control      | Active High  | Write Cascade Select                   |
| CSR  | 2:0   | Control      | Active High  | Read Cascade Select                    |
| RST  | 1     | Reset        | Active High  | Read output registers reset            |

**Table 726: Output Ports**

| Name      | Range | Type | Description                       |
|-----------|-------|------|-----------------------------------|
| DO        | 71:0  | Data | Data Output                       |
| ONEBITERR | 1     | Flag | ECC error flag (single bit error) |
| TWOBITERR | 1     | Flag | ECC error flag (two bit error)    |

**Note:**

All inputs (except the register control signals) and all outputs are registered in the following manner:

**PG**

Power Guard

Architectures Supported:

▶ LFMXO4

**Table 731: Input Ports**

| Name | Range | Description  |
|------|-------|--------------|
| D    | 1     | Data input D |
| E    | 1     | Data input E |

**Table 732: Output Ports**

| Name | Range | Description   |
|------|-------|---------------|
| Q    | 1     | Data output Q |

### Description

In the power guard mode, the receiver input is disconnected from the pad and held low with a weak pull down. The pad can be toggling and no receiver power will be used. Power guard is enabled on a bank by bank basis. Each bank has a CIB input signal to enable power guard. In addition, each PIO has individually programmable bit control to disable or enable the power guard capability.

You can generate a primitive for a group of I/O pins and then connect it in the design. The PG primitive D port must be connected to the IO pin. You are required to connect the enable input of the primitive to the signal that is used to activate the power guard function. Only one enable signal can be used for all I/Os within an individual I/O bank using power guard. An individual I/O pin is only allowed to connect to one PG primitive module but there could be more than one PG module active in a single I/O bank. Once an I/O signal is connected to the power guard primitive, the software sets the individually programmable bit for that PIO to enable power guard. The default setting for this bit is to disable the power guard function for a PIO.

The following table describes the IO ports of the PG primitive.

**Table 733:**

| Port Name | I/O | Description                                                                                                                               |
|-----------|-----|-------------------------------------------------------------------------------------------------------------------------------------------|
| D         | I   | This is the signal coming from an input or I/O pad. This pin cannot have any fanout—only connects between pad and PG.                     |
| E         | I   | This is the “ENABLE” input that is tied to BIE (Block Input Enable).<br>When E=0, Q is connected to D.<br>When E=1, Q is isolated from D. |
| Q         | O   | This is the output of the power guard that drives towards the core. When E=0, the output Q is driven by the input D.                      |

**Table 736: Parameters**

| Name         | Values                      | Description                                                                                                                                                                                                                                          |
|--------------|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DATA_WIDTH_W | 18 (default)                | Write data word width. Attached to a memory type primitive.                                                                                                                                                                                          |
| DATA_WIDTH_R | 1, 2, 4, 9, 18 (default 9)  | Read data word width. Attached to a memory type primitive.                                                                                                                                                                                           |
| REGMODE      | "NOREG" (default), "OUTREG" | Specifies the register mode for pipelining.                                                                                                                                                                                                          |
| RESETMODE    | "SYNC" (default), "ASYN"    | Reset type. This attribute is attached to a block RAM-type primitive that has a memory size smaller than 9 bits. When set to SYNC, the memory reset is synchronized with the clock. When set to ASYN, the memory reset is asynchronous to the clock. |

**Table 736: Parameters**

| <b>Name</b>         | <b>Values</b>                   | <b>Description</b>                                                                                                                                                                                                                                    |
|---------------------|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CSDECODE_W          | "0b000"                         | Attached to a single-port block RAM primitive. The CSDECODE value determines the decoding value of CS[2:0]. A value set to "000" means that the memory is selected if CS[2:0]=1'B000. This is tied with Write operations.                             |
| CSDECODE_R          | "0b000"                         | Attached to a single-port block RAM primitive. The CSDECODE value determines the decoding value of CS[2:0]. A value set to "000" means that the memory is selected if CS[2:0]=1'B000. This is tied with Read operations.                              |
| GSR                 | "ENABLED" (default), "DISABLED" | Enables or disables the Global Set/Reset (GSR) for all registered primitives. Applicable to registers, PLLs, and memories such as SP8KA and DP8KA.                                                                                                    |
| RESETMODE           | "SYNC" (default), "ASYNC"       | Reset type. This attribute is attached to a block RAM-type primitive that has a memory size smaller than 9 bits. When set to SYNC, the memory reset is synchronized with the clock. When set to ASYNC, the memory reset is asynchronous to the clock. |
| ASYNC_RESET_RELEASE | "SYNC" (default), "ASYNC"       | Reset release when the reset mode is ASYNC.                                                                                                                                                                                                           |

**Table 736: Parameters**

| Name                        | Values                                                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------|----------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INIT_DATA                   | "STATIC" (default),<br>"DYNAMIC"                                                       | Specifies if the initialization data (as defined by the INITVAL parameters) may be changed after the synthesis stage.<br><br>When INIT_DATA=STATIC, it is assumed that the initialization data will not change after synthesis, so an optimization to reduce the bitstream size can be applied.<br><br>When INIT_DATA=DYNAMIC it is assumed that the initialization data may change after synthesis, so the aforementioned optimization is disabled. |
| INITVAL_00 to<br>INITVAL_1F | "0x00000000000000000000<br>00000000000000000000<br>00000000000000000000<br>0000000000" | Initialization value                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## PLL

Wrapper for Phase Locked Loop

PLL is capable of frequency synthesis and clock phase management including clock injection delay cancellation.

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 737: Input Ports**

| Name      | Range | Description                                                                                                                                               |
|-----------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| DIR       | 1     | Valid if MC1_DYN_SOURCE = 1. Specifies direction that CIB_ROTATE changes VCO phase. 0 - phase rotates to later phase. 1 - Phase rotates to earlier phase. |
| DIRSEL    | 2:0   | Valid if MC1_DYN_SOURCE = 1. CIB_DYN_SEL must be stable before initiating a rotation with CIB_LOAD_REG.                                                   |
| LOADREG   | 1     | Valid if MC1_DYN_SOURCE = 1. Initiates a divider output phase shift on negative edge of CIB_LOAD_REG.                                                     |
| DYNROTATE | 1     | Valid if MC1_DYN_SOURCE = 1. Initiates a change from current VCO clock phase to an earlier or later phase on the negative edge of CIB_ROTATE.             |

**Table 737: Input Ports (Continued)**

| Name           | Range | Description                                                                                        |
|----------------|-------|----------------------------------------------------------------------------------------------------|
| LMMICKL        | 1     | LMMI clock from fabric.                                                                            |
| LMMIRESET_N    | 1     | LMMI reset signal to reset the state machine if the IP gets locked.                                |
| LMMIREQUEST    | 1     | LMMI request signal from fabric.                                                                   |
| LMMIWRRD_N     | 1     | LMMI write-high/read-low from fabric.                                                              |
| LMMIOFFSET     | 6:0   | LMMI offset address from fabric. Not all bits are required for an IP.                              |
| LMMIWDATA      | 7:0   | LMMI write data from fabric. Not all bits are required for an IP.                                  |
| PLLPOWERDOWN_N | 1     | Active low to power down PLL from CIB port.                                                        |
| REFCK          | 1     | Reference Clock Input                                                                              |
| ENCLKOP        | 1     | Enable A output (CLKOP). Active high. PLL CIB input.                                               |
| ENCLKOS        | 1     | Enable B output (CLKOS). Active high. PLL CIB input.                                               |
| ENCLKOS2       | 1     | Enable C output (CLKOS2). Active high. PLL CIB input.                                              |
| ENCLKOS3       | 1     | Enable D output (CLKOS3). Active high. PLL CIB input.                                              |
| ENCLKOS4       | 1     | Enable E output (CLKOS4). Active high. PLL CIB input.                                              |
| ENCLKOS5       | 1     | Enable F output (CLKOS5). Active high. PLL CIB input.                                              |
| FBKCK          | 1     | Feedback Clock Input                                                                               |
| LEGACY         | 1     | PLL legacy mode signal. Active high to enter the mode. Enabled by Immi_legacy fuse. PLL CIB input. |
| PLLRESET       | 1     | Active high to reset PLL. Enabled by MC1_PLLRESET. PLL CIB input.                                  |
| STDBY          | 1     | PLL standby signal. Active high to put PLL clocks in low. Not used.                                |
| ROTDEL         | 1     | Rotation Delay                                                                                     |
| DIRDEL         | 1     | Direction Delay                                                                                    |
| ROTDELP1       | 1     | Rotation Delay P1                                                                                  |
| GRAYTEST       | 4:0   | Gray Code Test Enable                                                                              |
| BINTEST        | 1:0   | Binary Code Test Enable                                                                            |
| DIRDELP1       | 1     | Direction Delay Plus One                                                                           |

**Table 737: Input Ports (Continued)**

| Name    | Range | Description        |
|---------|-------|--------------------|
| GRAYACT | 4:0   | Gray Code Active   |
| BINACT  | 1:0   | Binary Code Active |

**Table 738: Output Ports**

| Name           | Range | Description                                  |
|----------------|-------|----------------------------------------------|
| INTFBKOP       | 1     | Internal Feedback Output Positive            |
| INTFBKOS       | 1     | Internal Feedback Output Single-Ended        |
| INTFBKOS2      | 1     | Internal Feedback Output Single-Ended 2      |
| INTFBKOS3      | 1     | Internal Feedback Output Single-Ended 3      |
| INTFBKOS4      | 1     | Internal Feedback Output Single-Ended 4      |
| INTFBKOS5      | 1     | Internal Feedback Output Single-Ended 5      |
| LMMIRDATA      | 7:0   | LMMI read data to fabric.                    |
| LMMIRDATAVALID | 1     | LMMI read data valid to fabric.              |
| LMMIREADY      | 1     | LMMI ready signal to fabric.                 |
| CLKOP          | 1     | Primary (A) output clock.                    |
| CLKOS          | 1     | Secondary (B) output clock.                  |
| CLKOS2         | 1     | Secondary (C) output clock.                  |
| CLKOS3         | 1     | Secondary (D) output clock.                  |
| CLKOS4         | 1     | Secondary (E) output clock.                  |
| CLKOS5         | 1     | Secondary (F) output clock.                  |
| INTLOCK        | 1     | PLL internal lock indicator. PLL CIB output. |
| LEGRDYN        | 1     | PLL lock indicator. PLL CIB output.          |
| LOCK           | 1     |                                              |
| PFDDN          | 1     | PFD DN output signal to PLL CIB port.        |
| PFDUP          | 1     | PFD UP output signal to PLL CIB port.        |
| REFMUXCK       | 1     | Reference CLK mux output. PLL CIB output.    |

**Table 738: Output Ports (Continued)**

| Name     | Range | Description             |
|----------|-------|-------------------------|
| REGQA    | 1     | Register Q Output A     |
| REGQB    | 1     | Register Q Output B     |
| REGQB1   | 1     | Register Q Output B1    |
| CLKOUTDL | 1     | Clock Output Delay Line |

**Table 739: Parameters**

| Name        | Values                                                                                                                                                         | Description                                                                                                                                                            |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BW_CTL_BIAS | "0'b0101" ( <i>default</i> )<br>"0000"                                                                                                                         | Input control signal to tune the bias current of ppath cp, when the bit increase, the bias current increase. This current branch is combined with the lvco_fb current. |
| CLKOP_TRIM  | "0'b0000" ( <i>default</i> )                                                                                                                                   | CLKOP output trim control bits                                                                                                                                         |
| CLKOS_TRIM  | "0'b0000" ( <i>default</i> )                                                                                                                                   | CLKOS output trim control bits                                                                                                                                         |
| CLKOS2_TRIM | "0'b0000" ( <i>default</i> )                                                                                                                                   | CLKOS2 output trim control bits                                                                                                                                        |
| CLKOS3_TRIM | "0'b0000" ( <i>default</i> )                                                                                                                                   | CLKOS3 output trim control bits                                                                                                                                        |
| CLKOS4_TRIM | "0'b0000" ( <i>default</i> )                                                                                                                                   | CLKOS4 output trim control bits                                                                                                                                        |

**Table 739: Parameters**

| Name         | Values                            | Description                                                                        |
|--------------|-----------------------------------|------------------------------------------------------------------------------------|
| DELAY_CTRL   | "200PS" (default)<br>"300PS"      | Control signal to adjust the delay of the PFD: default 1b0 = 200 ps; 1b1 = 300 ps. |
| DELA         | "0" (default)                     | Output divider phase shift. Works with Immi_diva.                                  |
| DELB         | "0" (default)                     | Output divider phase shift. Works with Immi_divb.                                  |
| DELC         | "0" (default)                     | Output divider phase shift. Works with Immi_divc.                                  |
| DELD         | "0" (default)                     | Output divider phase shift. Works with Immi_divd.                                  |
| DELE         | "0" (default)                     | Output divider phase shift. Works with Immi_dive.                                  |
| DELF         | "0" (default)                     | Output divider phase shift. Works with Immi_divf.                                  |
| DIRECTION    | "DISABLED" (default)<br>"ENABLED" | LMMI equivalent of CIB direction signal                                            |
| DIVA         | "0" (default)                     | Output dividers for CLKOP                                                          |
| DIVB         | "0" (default)                     | Output dividers for CLKOS                                                          |
| DIVC         | "0" (default)                     | Output dividers for CLKOS2                                                         |
| DIVD         | "0" (default)                     | Output dividers for CLKOS3                                                         |
| DIVE         | "0" (default)                     | Output dividers for CLKOS4                                                         |
| DIVF         | "0" (default)                     | Output dividers for CLKOS5                                                         |
| DYN_SEL      | "0'b000" (default)                | Dynamic phase selection                                                            |
| DYN_SOURCE   | "STATIC" (default)<br>"DYNAMIC"   | 1'b1 selects CIB signals for dynamic phase shift.                                  |
| ENCLK_CLKOP  | "DISABLED" (default)<br>"ENABLED" | Bit 0. Clock output enable. Active high.                                           |
| ENCLK_CLKOS  | "DISABLED" (default)<br>"ENABLED" | Bit 1. Clock output enable. Active high.                                           |
| ENCLK_CLKOS2 | "DISABLED" (default)<br>"ENABLED" | Bit 2. Clock output enable. Active high.                                           |
| ENCLK_CLKOS3 | "DISABLED" (default)<br>"ENABLED" | Bit 3. Clock output enable. Active high.                                           |
| ENCLK_CLKOS4 | "DISABLED" (default)<br>"ENABLED" | Bit 4. Clock output enable. Active high.                                           |
| ENCLK_CLKOS5 | "DISABLED" (default)<br>"ENABLED" | Bit 5. Clock output enable. Active high.                                           |
| ENABLE_SYNC  | "DISABLED" (default)<br>"ENABLED" | 1'b1 enables output sync with CLKOP.                                               |
| FAST_LOCK_EN | "ENABLED" (default)<br>"DISABLED" | Enables signal for fast lock.                                                      |
| V2I_1V_EN    | "DISABLED" (default)<br>"ENABLED" | 1V supply enable or disable                                                        |

**Table 739: Parameters**

| Name              | Values                                    | Description                                                                                                                                                                                                                                                                       |
|-------------------|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FBK_CUR_BLE       | "0'b00000000"<br>(default)                | Bleeding current for PI to adjust the linearity                                                                                                                                                                                                                                   |
| FBK_EDGE_SEL      | "POSITIVE" (default)<br>"NEGATIVE"        | Select the positive or negative phase of PI output. 0: positive phase; 1: negative phase                                                                                                                                                                                          |
| FBK_IF_TIMING_CTL | "0'b00" (default)                         | Interface timing control for feedback divider                                                                                                                                                                                                                                     |
| FBK_INTEGER_MODE  | "DISABLED" (default)<br>"ENABLED"         | Enable the integer mode for feedback divider                                                                                                                                                                                                                                      |
| FBK_MASK          | "0'b00001000"<br>(default)<br>"00000000"  | Minimum divider ratio control word for feedback divider. For example if n_pll[7:0] or mmd_dig[7:0] is less than Immi_fbk_mask[7:0], then the MMD divider ratio is determined by Immi_fbk_mask[7:0]. Otherwise the divider ratio will be determined by n_pll[7:0] or mmd_dig[7:0]. |
| FBK_MMD_DIG       | "8" (default)<br>"0"                      | MMD divider ratio setting in integer mode                                                                                                                                                                                                                                         |
| FBK_MMD_PULS_CTL  | "0'b0000" (default)                       | Pulse width control for MMD output clock. If Immi_fbk_mmd_puls_ctl[3:0]=4'b0110, it means that there's 6 VCO cycles in the MMD output clock.                                                                                                                                      |
| FBK_MODE          | "0'b00" (default)                         | Reserved floating control bits                                                                                                                                                                                                                                                    |
| FBK_PI_BYPASS     | "NOT_BYPASSED"<br>(default)<br>"BYPASSED" | PI bypass control bit. 0; PI not bypass, 1; PI bypass; it should be connected to Immi_ssc_pi_bypass                                                                                                                                                                               |
| FBK_PI_RC         | "0'b1100" (default)<br>"0000"             | RC time constant control in PI                                                                                                                                                                                                                                                    |
| FBK_PR_CC         | "0'b0000" (default)                       | Current control for PI to adjust the linearity                                                                                                                                                                                                                                    |
| FBK_PR_IC         | "0'b1000" (default)<br>"0000"             | Bias current control for PI                                                                                                                                                                                                                                                       |
| FBK_RSV           | "0'b0000000000000000"<br>0" (default)     | Reserved control bit for feedback divider.                                                                                                                                                                                                                                        |
| FLOAT_CP          | "DISABLED" (default)<br>"ENABLED"         | Active high to tri-state the ICP output.                                                                                                                                                                                                                                          |

| CONFIG_WAIT_FOR_LOCK   | "DISABLED" (default)<br>"ENABLED"                | Wait for PLL lock during configuration<br>Note: This attribute is not available in Avant.                               |

**PLL Device Constraints:**

Below are the device constraint equations used by the timer for the periods, phases, and delays of the output clocks based on user settings. START\_PERIOD must be provided as a constraint. These equations only apply for the integer mode divider values.

For CLKOP (generated clock):

- ▶  $\text{ADJUSTED\_PERIOD} = \text{START\_PERIOD} * (\text{REF\_MMD\_DIG} + 1) * (\text{DIVA} + 1) * (1/(\text{FBK\_MMD\_DIG} + 1))$
- ▶  $\text{ADJUSTED\_PHASE} = ((\text{PHIA} * 45)/360) * \text{ADJUSTED\_PERIOD}$
- ▶  $\text{ADJUSTED\_DELAY} = \text{START\_PERIOD} * (\text{REF\_MMD\_DIG} + 1) * (1/(\text{FBK\_MMD\_DIG} + 1)) * \text{DELA}$

For CLKOS (generated clock):

- ▶  $\text{ADJUSTED\_PERIOD} = \text{START\_PERIOD} * (\text{REF\_MMD\_DIG} + 1) * (\text{DIVB} + 1) * (1/(\text{FBK\_MMD\_DIG} + 1))$
- ▶  $\text{ADJUSTED\_PHASE} = ((\text{PHIB} * 45)/360) * \text{ADJUSTED\_PERIOD}$
- ▶  $\text{ADJUSTED\_DELAY} = \text{START\_PERIOD} * (\text{REF\_MMD\_DIG} + 1) * (1/(\text{FBK\_MMD\_DIG} + 1)) * \text{DELB}$

For CLKOS2 (generated clock):

- ▶  $\text{ADJUSTED\_PERIOD} = \text{START\_PERIOD} * (\text{REF\_MMD\_DIG} + 1) * (\text{DIVC} + 1) * (1/(\text{FBK\_MMD\_DIG} + 1))$

- ▶  $\text{ADJUSTED\_PHASE} = ((\text{PHIC} * 45) / 360) * \text{ADJUSTED\_PERIOD}$
- ▶  $\text{ADJUSTED\_DELAY} = \text{START\_PERIOD} * (\text{REF\_MMD\_DIG} + 1) * (1 / (\text{FBK\_MMD\_DIG} + 1)) * \text{DELC}$

For CLKOS3 (generated clock):

- ▶  $\text{ADJUSTED\_PERIOD} = \text{START\_PERIOD} * (\text{REF\_MMD\_DIG} + 1) * (\text{DIVD} + 1) * (1 / (\text{FBK\_MMD\_DIG} + 1))$
- ▶  $\text{ADJUSTED\_PHASE} = ((\text{PHID} * 45) / 360) * \text{ADJUSTED\_PERIOD}$
- ▶  $\text{ADJUSTED\_DELAY} = \text{START\_PERIOD} * (\text{REF\_MMD\_DIG} + 1) * (1 / (\text{FBK\_MMD\_DIG} + 1)) * \text{DELD}$

For CLKOS4 (generated clock):

- ▶  $\text{ADJUSTED\_PERIOD} = \text{START\_PERIOD} * (\text{REF\_MMD\_DIG} + 1) * (\text{DIVE} + 1) * (1 / (\text{FBK\_MMD\_DIG} + 1))$
- ▶  $\text{ADJUSTED\_PHASE} = ((\text{PHIE} * 45) / 360) * \text{ADJUSTED\_PERIOD}$
- ▶  $\text{ADJUSTED\_DELAY} = \text{START\_PERIOD} * (\text{REF\_MMD\_DIG} + 1) * (1 / (\text{FBK\_MMD\_DIG} + 1)) * \text{DELE}$

For CLKOS5 (generated clock):

- ▶  $\text{ADJUSTED\_PERIOD} = \text{START\_PERIOD} * (\text{REF\_MMD\_DIG} + 1) * (\text{DIVF} + 1) * (1 / (\text{FBK\_MMD\_DIG} + 1))$
- ▶  $\text{ADJUSTED\_PHASE} = ((\text{PHIF} * 45) / 360) * \text{ADJUSTED\_PERIOD}$
- ▶  $\text{ADJUSTED\_DELAY} = \text{START\_PERIOD} * (\text{REF\_MMD\_DIG} + 1) * (1 / (\text{FBK\_MMD\_DIG} + 1)) * \text{DELF}$

## PLLA

Wrapper for Phase Locked Loop

PLLA is capable of frequency synthesis and clock phase management including clock injection delay cancellation.

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 740: Input Ports**

| Name        | Range | Description                                                                                                                                            |
|-------------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| DIR         | 1     | Valid if MC1_DYN_SOURCE = 1. Specify direction that CIB_ROTATE changes VCO phase. 0 - phase rotates to later phase. 1 - Phase rotates to earlier phase |
| DIRSEL      | 2:0   | Valid if MC1_DYN_SOURCE = 1. CIB_DYN_SEL must be stable before initiating a rotation with CIB_LOAD_REG                                                 |
| LOADREG     | 1     | Valid if MC1_DYN_SOURCE = 1. Initiate a divider output phase shift on negative edge of CIB_LOAD_REG                                                    |
| DYNROTATE   | 1     | Valid if MC1_DYN_SOURCE = 1. Initiate a change from current VCO clock phase to an earlier or later phase on the negative edge of CIB_ROTATE            |
| LMMICLK     | 1     | LMMI Clock from Fabric                                                                                                                                 |
| LMMIRESET_N | 1     | LMMI Reset Signal to reset the state machine if the IP gets locked                                                                                     |
| LMMIREQUEST | 1     | LMMI Request signal from Fabric                                                                                                                        |

**Table 740: Input Ports (Continued)**

| Name           | Range | Description                                                                                       |
|----------------|-------|---------------------------------------------------------------------------------------------------|
| LMMIWRRD_N     | 1     | LMMI Write High / Read Low from Fabric                                                            |
| LMMIOFFSET     | 6:0   | LMMI Offset Address from Fabric, not all bits are required for an IP                              |
| LMMIWDATA      | 7:0   | LMMI Write Data from Fabric, not all bits are required for an IP                                  |
| PLLPOWERDOWN_N | 1     | Active low to power down PLL from CIB port                                                        |
| REFCK          | 1     | Reference Clock Input                                                                             |
| ENCLKOP        | 1     | Enable A output (CLKOP). Active high. PLL CIB input                                               |
| ENCLKOS        | 1     | Enable B output (CLKOS). Active high. PLL CIB input                                               |
| ENCLKOS2       | 1     | Enable C output (CLKOS2). Active high. PLL CIB input                                              |
| ENCLKOS3       | 1     | Enable D output (CLKOS3). Active high. PLL CIB input                                              |
| ENCLKOS4       | 1     | Enable E output (CLKOS4). Active high. PLL CIB input                                              |
| ENCLKOS5       | 1     | Enable F output (CLKOS5). Active high. PLL CIB input                                              |
| FBKCK          | 1     | Feedback Clock Input                                                                              |
| LEGACY         | 1     | PLL legacy mode signal. Active high to enter the mode. Enabled by lmmi_legacy fuse. PLL CIB input |
| PLLRESET       | 1     | Active high to reset PLL. Enabled by MC1_PLLRESET. PLL CIB input                                  |
| STDBY          | 1     | PLL standby signal. Active high to put PLL clocks in low. Not used                                |
| ROTDEL         | 1     | Rotation Delay                                                                                    |
| DIRDEL         | 1     | Direction Delay                                                                                   |
| ROTDELP1       | 1     | Rotation Delay Plus One                                                                           |
| GRAYTEST       | 4:0   | Gray Code Test Mode Enable                                                                        |
| BINTEST        | 1:0   | Binary Code Test Mode Enable                                                                      |
| DIRDELP1       | 1     | Direction Delay Plus One                                                                          |
| GRAYACT        | 4:0   | Gray Code Active Indicator                                                                        |
| BINACT         | 1:0   | Binary Code Active Indicator                                                                      |
| REFDETRESET    | 1     | Reference Detector Reset                                                                          |

**Table 741: Output Ports**

| <b>Name</b>    | <b>Range</b> | <b>Description</b>                            |
|----------------|--------------|-----------------------------------------------|
| INTFBKOP       | 1            | Internal Feedback Clock Output Positive       |
| INTFBKOS       | 1            | Internal Feedback Clock Output Single-Ended   |
| INTFBKOS2      | 1            | Internal Feedback Clock Output Single-Ended 2 |
| INTFBKOS3      | 1            | Internal Feedback Clock Output Single-Ended 3 |
| INTFBKOS4      | 1            | Internal Feedback Clock Output Single-Ended 4 |
| INTFBKOS5      | 1            | Internal Feedback Clock Output Single-Ended 5 |
| LMMIRDATA      | 7:0          | LMMI Read Data to Fabric                      |
| LMMIRDATAVALID | 1            | LMMI Read Date Valid to Fabric                |
| LMMIREADY      | 1            | LMMI Ready signal to Fabric                   |
| CLKOP          | 1            | Primary (A) output clock                      |
| CLKOS          | 1            | Secondary (B) output clock                    |
| CLKOS2         | 1            | Secondary (C) output clock                    |
| CLKOS3         | 1            | Secondary (D) output clock                    |
| CLKOS4         | 1            | Secondary (E) output clock                    |
| CLKOS5         | 1            | Secondary (F) output clock                    |
| INTLOCK        | 1            | PLL internal lock indicator. PLL CIB output   |
| LEGRDYN        | 1            | Legacy Ready                                  |
| LOCK           | 1            | PLL lock indicator. PLL CIB output            |
| PFD DN         | 1            | PFD DN output signal to PLL CIB port          |
| PFDUP          | 1            | PFD UP output signal to PLL CIB port          |
| REFMUXCK       | 1            | Reference CLK mux output. PLL CIB output      |
| REGQA          | 1            | Register Q Output A                           |
| REGQB          | 1            | Register Q Output B                           |
| REGQB1         | 1            | Register Q Output B1                          |
| CLKOUTDL       | 1            | Clock Output Delay Line                       |
| REFDETLOS      | 1            | Reference Detect Loss Indicator               |

**Table 743: Input Ports**

| Name                          | Description                                                                                                                                                                                                                                                                                      |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REFERENCECLK                  | Reference clock                                                                                                                                                                                                                                                                                  |
| FEEDBACK                      | External feedback input                                                                                                                                                                                                                                                                          |
| DYNAMICDELAY7...DYNAMICDELAY0 | Dynamic control of delay for adjusting the phase alignment. Only used when DELAY_ADJUSTMENT_MODE is set to DYNAMIC. RESETB must be active before this bus can change value in order to ensure proper PLL functionality. Once value is changed user must set RESETB high and wait for PLL to lock |
| BYPASS                        | Bypass PLL core (directly connect REFERENCECLK to OUTCORE/OUTGLOBAL pins)                                                                                                                                                                                                                        |
| RESET_N                       | Asynchronously reset the PLL, active low                                                                                                                                                                                                                                                         |
| SCLK                          | Clock for internal testing                                                                                                                                                                                                                                                                       |
| SDI                           | Data for internal testing                                                                                                                                                                                                                                                                        |
| LATCH                         | Enable low power mode, active high. OUTGLOBAL*/OUTCORE* ports are held static at their last value when ENABLE_ICEGATE_PORT* is set to 1                                                                                                                                                          |

**Table 744: Output Ports**

| Name      | Description                                                             |
|-----------|-------------------------------------------------------------------------|
| INTFBOUT  | For internal feedback PLL operation, must route this output to FEEDBACK |
| OUTCORE   | Output clock A, drives regular fabric routing                           |
| OUTGLOBAL | Output clock A, drives global clock network                             |

**Table 744: Output Ports (Continued)**

| Name       | Description                                                                                             |
|------------|---------------------------------------------------------------------------------------------------------|
| OUTCOREB   | Output clock B, drives regular fabric routing                                                           |
| OUTGLOBALB | Output clock B, drives global clock network                                                             |
| SDO        | Data for internal testing                                                                               |
| LOCK       | Indicates that the output signal on OUTGLOBALB/OUTCOREB is locked to the REFERENCECLK port, active high |

**Table 745: Parameters**

| Name                           | Values                                                                                                                                               | Description                                                                                                                                                                                                                                 |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FEEDBACK_PATH                  | "SIMPLE" ( <i>default</i> ),<br>"DELAY",<br>"PHASE_AND_DELAY"                                                                                        | Selects the feedback path.<br>SIMPLE = internal feedback, directly from VCO.<br>DELAY = internal feedback, through the delay adjustment block.<br>PHASE_AND_DELAY = internal feedback, through the phase shifter and delay adjustment block |
| DELAY_ADJUSTMENT_MODE_FEEDBACK | "FIXED" ( <i>default</i> ),<br>"DYNAMIC"                                                                                                             | Selects the mode for the delay adjustment block in the feedback path.<br>FIXED = fixed delay, selected with the FDA_FEEDBACK parameter.<br>DYNAMIC = dynamic delay, selected by the DYNAMICDELAY port                                       |
| FDA_FEEDBACK                   | "0" ( <i>default</i> ),<br>"1",<br>"2",<br>"3",<br>"4",<br>"5",<br>"6",<br>"7",<br>"8",<br>"9",<br>"10",<br>"11",<br>"12",<br>"13",<br>"14",<br>"15" | Sets a constant value for the delay adjustment block.<br>OUTGLOBALA and OUTCOREA are delayed by $(n+1)*150\text{ps}$                                                                                                                        |

**Rules & Restrictions:**

FEEDBACK port (external feedback input pin) CANNOT be VHI, VLO, or floating. Otherwise, PLL in HW will not operate correctly.

When EXTERNAL\_DIVIDE\_FACTOR != NONE,  
DELAY\_ADJUSTMENT\_MODE should be set to either FIXED or DYNAMIC.

When EXTERNAL\_DIVIDE\_FACTOR != NONE, PLLOUT\_SELECT\_PORTA != SHIFTREG\_0deg, PLLOUT\_SELECT\_PORTA != SHIFTREG\_90deg,  
PLLOUT\_SELECT\_PORTB != SHIFTREG\_0deg,  
PLLOUT\_SELECT\_PORTB != SHIFTREG\_90deg.

When FEEDBACK\_PATH = DELAY,  
DELAY\_ADJUSTMENT\_MODE\_FEEDBACK should be set to either FIXED or DYNAMIC.

When FEEDBACK\_PATH = DELAY, PLLOUT\_SELECT\_PORTA != SHIFTREG\_0deg, PLLOUT\_SELECT\_PORTA != SHIFTREG\_90deg,  
PLLOUT\_SELECT\_PORTB != SHIFTREG\_0deg,  
PLLOUT\_SELECT\_PORTB != SHIFTREG\_90deg.

When `FEEDBACK_PATH = PHASE_AND_DELAY`,  
`DELAY_ADJUSTMENT_MODE_FEEDBACK` should be set to either `FIXED`  
or `DYNAMIC`.

When `FEEDBACK_PATH = PHASE_AND_DELAY` both  
`PLLOUT_SELECT_PORTA` and `PLLOUT_SELECT_PORTB` must be set to  
either `SHIFTREG_0deg` or `SHIFTREG_90deg`.

When `EXTERNAL_DIVIDE_FACTOR = NONE`, make sure `INTFBOUT` is  
connected to `FEEDBACK`.

When `EXTERNAL_DIVIDE_FACTOR != NONE`, make sure `INTFBOUT` is  
NOT connected to `FEEDBACK`.

`REFERNCECLK` input must be between 10 and 133 MHz.

### How to calculate output frequency:

When `FEEDBACK_PATH = "SIMPLE"`, the calculation of the period of the  
output clock of `PLL_B` is:

$$\text{Output\_period} = \text{reference\_clk\_period} * \\
\_\_\text{EQ\_}[\text{EXTERNAL\_DIVIDE\_FACTOR}, \text{NONE}, (2^{\text{DIVQ}}), 1/ \\
\text{EXTERNAL\_DIVIDE\_FACTOR}] * (\text{DIVR} + 1) * (1/(\text{DIVF} + 1)) * \\
\_\_\text{EQ\_}[\text{PLLOUT\_SELECT\_PORTB}, \text{GENCLK\_HALF}, 2, 1]$$

When `FEEDBACK_PATH = "DELAY"`, the calculation of the period of the  
output clock of `PLL_B` is:

$$\text{Output\_period} = \text{reference\_clk\_period} * \\
\_\_\text{EQ\_}[\text{EXTERNAL\_DIVIDE\_FACTOR}, \text{NONE}, 1, 1/ \\
\text{EXTERNAL\_DIVIDE\_FACTOR}] * (\text{DIVR} + 1) * (1/(\text{DIVF} + 1)) * \\
\_\_\text{EQ\_}[\text{PLLOUT\_SELECT\_PORTB}, \text{GENCLK\_HALF}, 2, 1]$$

When `FEEDBACK_PATH = "PHASE_AND_DELAY"`, the calculation of the  
period of the output clock of `PLL_B` is:

$$\text{Output\_period} = \text{reference\_clk\_period} * \\
\_\_\text{EQ\_}[\text{EXTERNAL\_DIVIDE\_FACTOR}, \text{NONE}, 1, 1/ \\
\text{EXTERNAL\_DIVIDE\_FACTOR}] * (\text{DIVR} + 1) * (1/(\text{DIVF} + 1)) * \\
\_\_\text{EQ\_}[\text{PLLOUT\_SELECT\_PORTA}, \text{GENCLK\_HALF}, 2, 1] * \\
\_\_\text{EQ\_}[\text{PLLOUT\_SELECT\_PORTA}, \text{SHIFTREG\_0deg}, \\
\_\_\text{EQ\_}[\text{SHIFTREG\_DIV\_MODE}, 1, 7, 4], 1] * \\
\_\_\text{EQ\_}[\text{PLLOUT\_SELECT\_PORTA}, \text{SHIFTREG\_0deg}, \\
\_\_\text{EQ\_}[\text{SHIFTREG\_DIV\_MODE}, 1, 7, 4], 1]$$

In the above equations, the sections beginning with “`__EQ__`” and enclosed  
in “[ ]” are treated as if/else statements during calculation. For example,  
“`__EQ__[EXTERNAL_DIVIDE_FACTOR, NONE, 1, 1/`  
`EXTERNAL_DIVIDE_FACTOR]`” means that if  
`EXTERNAL_DIVIDE_FACTOR` is set to `NONE` then use the value “1,”  
otherwise use the value “`1/EXTERNAL_DIVIDE_FACTOR`” in the calculation.

### Note:

EXTERNAL\_DIVIDE\_FACTOR is embedded in each of the equations, so even if you are using external feedback in your design, you will still need to choose one of the above equations based on the FEEDBACK\_PATH setting.

#### Example PLL\_B Instantiation (External Feedback):

```
PLL_B PLL_B_inst (
  .REFERENCECLK      (REFERENCECLK      ),
  .FEEDBACK          (FEEDBACK          ),
  .DYNAMICDELAY7     (DYNAMICDELAY7     ),
  .DYNAMICDELAY6     (DYNAMICDELAY6     ),
  .DYNAMICDELAY5     (DYNAMICDELAY5     ),
  .DYNAMICDELAY4     (DYNAMICDELAY4     ),
  .DYNAMICDELAY3     (DYNAMICDELAY3     ),
  .DYNAMICDELAY2     (DYNAMICDELAY2     ),
  .DYNAMICDELAY1     (DYNAMICDELAY1     ),
  .DYNAMICDELAY0     (DYNAMICDELAY0     ),
  .BYPASS            (BYPASS            ),
  .RESET_N           (RESET_N           ),
  .SCLK              (SCLK              ),
  .SDI               (SDI               ),
  .LATCH             (LATCH             ),
  .INTFBOUT          (/ *NOT CONNECTED* /),
  .OUTCORE           (OUTCORE           ),
  .OUTGLOBAL         (                  ),
  .OUTCOREB          (OUTCOREB          ),
  .OUTGLOBALB        (                  ),
  .SDO               (SDO               ),
  .LOCK              (LOCK              )
);

defparam PLL_B_inst.EXTERNAL_DIVIDE_FACTOR = "15";
defparam PLL_B_inst.DELAY_ADJUSTMENT_MODE_FEEDBACK = "DYNAMIC";
```

#### Example PLL\_B Instantiation (Internal Feedback):

```
PLL_B PLL_B_inst (
  .REFERENCECLK      (REFERENCECLK      ),
  .FEEDBACK          (INTFBOUT          ),
  .DYNAMICDELAY7     (DYNAMICDELAY7     ),
  .DYNAMICDELAY6     (DYNAMICDELAY6     ),
  .DYNAMICDELAY5     (DYNAMICDELAY5     ),
  .DYNAMICDELAY4     (DYNAMICDELAY4     ),
  .DYNAMICDELAY3     (DYNAMICDELAY3     ),
  .DYNAMICDELAY2     (DYNAMICDELAY2     ),
  .DYNAMICDELAY1     (DYNAMICDELAY1     ),
  .DYNAMICDELAY0     (DYNAMICDELAY0     ),
  .BYPASS            (BYPASS            ),
  .RESET_N           (RESET_N           ),
  .SCLK              (SCLK              ),
  .SDI               (SDI               ),
  .LATCH             (LATCH             ),
  .INTFBOUT          (INTFBOUT          ),
  .OUTCORE           (OUTCORE           ),
  .OUTGLOBAL         (                  ),
  .OUTCOREB          (OUTCOREB          ),
  .OUTGLOBALB        (                  ),
  .SDO               (SDO               )
);
```

```

        .LOCK                                (LOCK                                )
    );

    defparam PLL_B_inst.EXTERNAL_DIVIDE_FACTOR = "NONE";
    defparam PLL_B_inst.FEEDBACK_PATH = "SIMPLE";

```

## PLLC

PLL functional block

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 746: Input Ports**

| Name     | Range | Type  | Active State | Description                      |
|----------|-------|-------|--------------|----------------------------------|
| CLKI     | 1     | Clock | Active high  | Reference Clock                  |
| CLKFB    | 1     | Clock | Active high  | Feedback Clock                   |
| RESET    | 1     | Reset | Active high  | PLL Reset                        |
| ENCLKPHY | 1     | Clock | Active high  | Enable Physical clock output     |
| ENCLKOP  | 1     | Clock | Active high  | Enable CLKOP (DIVA) clock output |
| ENCLKOS  | 1     | Clock | Active high  | Enable CLKOS (DIVB) clock output |

**Table 747: Output Ports**

| Name    | Range | Type  | Active State | Description                    |
|---------|-------|-------|--------------|--------------------------------|
| CLKOPHY | 1     | Clock | Active high  | High speed PHYCLK              |
| CLKOP   | 1     | Clock | Active high  | Primary CLKOP (DIVA) output    |
| CLKOS   | 1     | Clock | Active high  | Secondary CLKOS (DIVB) output  |
| CLKOS2  | 1     | Clock | Active high  | Secondary CLKOS2 (DIVC) output |
| CLKOS3  | 1     | Clock | Active high  | Secondary CLKOS3 (DIVD) output |

**Table 747: Output Ports (Continued)**

| Name               | Range | Type  | Active State | Description                                     |
|--------------------|-------|-------|--------------|-------------------------------------------------|
| CLKOS4             | 1     | Clock | Active high  | Secondary CLKOS4 (DIVE) output                  |
| CLKOS5             | 1     | Clock | Active high  | Secondary CLKOS5 (DIVF) output                  |
| CLKOREF            | 1     | Clock | Active high  | The reference CLK output                        |
| LOCK               | 1     | Data  | Active high  | PLL lock indicator                              |
| CLKOP_STEPACK      | 1     | Clock | Active high  | CLKOP VCO PS status                             |
| CLKOS_STEPACK      | 1     | Clock | Active high  | CLKOS VCO PS status                             |
| CLKOS2_STEPACK     | 1     | Clock | Active high  | CLKOS2 VCO PS status                            |
| CLKOS3_STEPACK     | 1     | Clock | Active high  | CLKOS3 VCO PS status                            |
| CLKOS4_STEPACK     | 1     | Clock | Active high  | CLKOS4 VCO PS status                            |
| CLKOS5_STEPACK     | 1     | Clock | Active high  | CLKOS5 VCO PS status                            |
| CLKPHY_STEPACK     | 1     | Clock | Active high  | CLKPHY VCO PS status                            |
| CLKOP_OUTRESETACK  | 1     | Clock | Active high  | CLKOP reset status                              |
| CLKOS_OUTRESETACK  | 1     | Clock | Active high  | CLKOS reset status                              |
| CLKOS2_OUTRESETACK | 1     | Clock | Active high  | CLKOS2 reset status                             |
| CLKOS3_OUTRESETACK | 1     | Clock | Active high  | CLKOS3 reset status                             |
| CLKOS4_OUTRESETACK | 1     | Clock | Active high  | CLKOS4 reset status                             |
| CLKOS5_OUTRESETACK | 1     | Clock | Active high  | CLKOS5 reset status                             |
| CLKPHY_OUTRESETACK | 1     | Clock | Active high  | CLKPHY reset status                             |
| CLKISLIP           | 1     | Clock | Active high  | Reference cycle slip output                     |
| CLKFBSLIP          | 1     | Clock | Active high  | Feedback cycle slip output                      |
| CLKIDIVCHANGE      | 1     | Clock | Active high  | Reference divider NR count change enable output |
| CLKFBDIVCHANGE     | 1     | Clock | Active high  | Feedback divider NF count change enable output  |
| LMMIRDATA          | 15:0  | Data  | Active high  | LMMI read data                                  |
| LMMIRDATAVALID     | 1     | Data  | Active high  | LMMI data valid                                 |
| LMMIREADY          | 1     | Data  | Active high  | LMMI Ready                                      |
| CLKRES             | 1     | Clock | Active high  | CLKRES output                                   |
| CLKRES_STEPACK     | 1     | Clock | Active high  | CLKRES VCO PS status                            |
| CLKRES_OUTRESETACK | 1     | Clock | Active high  | CLKRES reset status                             |

**Table 748: Parameters**

| Name                  | Values                  | Description                                                                                                                                                                                                                                                                                       |
|-----------------------|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FCLKI                 | "100" (default)         | None                                                                                                                                                                                                                                                                                              |
| FVCO                  | "1600 MHz" - "4000 MHz" | The actual FVCO value is not user defined.<br><br>In the Lattice Avant PLL Module configuration interface, when Enable Dynamic Phase Ports is checked, a Use Phase Advance option is added. When this is enabled, the maximum VCO frequency is reduced. Otherwise, the value remains at 4000 MHz. |
| CLKOP_OUT_SEL         | "DIVA" (default)        | Select output to CLKOP 0: DIVA: 1: CLKI                                                                                                                                                                                                                                                           |
| CLKOS_OUT_SEL         | "DIVB" (default)        | Select output to CLKOS0: DIVB: 1: CLKI                                                                                                                                                                                                                                                            |
| CLKOS2_OUT_SEL        | "DIVC" (default)        | Select output to CLKOS20: DIVC: 1: CLKI                                                                                                                                                                                                                                                           |
| CLKOS3_OUT_SEL        | "DIVD" (default)        | Select output to CLKOS30: DIVD: 1: CLKI                                                                                                                                                                                                                                                           |
| CLKOS4_OUT_SEL        | "DIVE" (default)        | Select output to CLKOS40: DIVE: 1: CLKI                                                                                                                                                                                                                                                           |
| CLKOS5_OUT_SEL        | "DIVF" (default)        | Select output to CLKOS50: DIVF: 1: CLKI                                                                                                                                                                                                                                                           |
| CLKPHY_OUT_SEL        | "DIVPHY" (default)      | Select output to CLKPHY0: DIVPHY: 1: CLKI                                                                                                                                                                                                                                                         |
| CLKRES_OUT_SEL        | "DIVRES" (default)      | Select output of divider (DIVRES) or reference clock (CLKI) to CLKRES                                                                                                                                                                                                                             |
| SYNC_CLKOP            | "DISABLED" (default)    | Enable output(s) sync with CLKOP0: disabled; 1: enabled                                                                                                                                                                                                                                           |
| PHASE_SOURCE          | "STATIC" (default)      | 1b1 select DYN (CIB signals) for dynamic phase shift                                                                                                                                                                                                                                              |
| STATIC_PHASE_SEL      | "CLKOP" (default)       | To select which output clocks is phase shifted                                                                                                                                                                                                                                                    |
| STATIC_PHASE_LOADREG  | "NO" (default)          | Immi equivalent of CIB load signal                                                                                                                                                                                                                                                                |
| STATIC_VCO_PHASE_STEP | "NO" (default)          | Trigger for VCO phase rotation, 1: YES; 0: NO                                                                                                                                                                                                                                                     |
| STATIC_VCO_PHASE_DIR  | "DELAYED" (default)     | VCO phase rotation direction, 1b0 for phase lagging0 -> phase rotates to later phase (lagging, delayed)1 -> Phase rotates to earlier phase (leading, advanced)                                                                                                                                    |
| CLKOP_FPHASE          | "1" (default)           | VCO phase A step control                                                                                                                                                                                                                                                                          |
| CLKOS_FPHASE          | "1" (default)           | VCO phase B step control                                                                                                                                                                                                                                                                          |
| CLKOS2_FPHASE         | "1" (default)           | VCO phase C step control                                                                                                                                                                                                                                                                          |
| CLKOS3_FPHASE         | "1" (default)           | VCO phase D step control                                                                                                                                                                                                                                                                          |
| CLKOS4_FPHASE         | "1" (default)           | VCO phase E step control                                                                                                                                                                                                                                                                          |
| CLKOS5_FPHASE         | "1" (default)           | VCO phase F step control                                                                                                                                                                                                                                                                          |
| CLKPHY_FPHASE         | "1" (default)           | VCO phase PHY step control                                                                                                                                                                                                                                                                        |

**Table 748: Parameters (Continued)**

| <b>Name</b>         | <b>Values</b>                    | <b>Description</b>                                                                                                                       |
|---------------------|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| CLKRES_FPHASE       | "1" (default)                    | VCO phase RES step control                                                                                                               |
| CLKOP_CPHASE        | "1" (default)                    | Delay A section output DELA VCO clock cycles with respect to VCO phase 0, or REFBUF if in VCO bypass mode (post-divider phase-shift)     |
| CLKOS_CPHASE        | "1" (default)                    | Delay B section output DELB VCO clock cycles with respect to VCO phase 0, or REFBUF if in VCO bypass mode (post-DELAYider phase-shift)   |
| CLKOS2_CPHASE       | "1" (default)                    | Delay C section output DELC VCO clock cycles with respect to VCO phase 0, or REFBUF if in VCO bypass mode (post-DELAYider phase-shift)   |
| CLKOS3_CPHASE       | "1" (default)                    | Delay D section output DELD VCO clock cycles with respect to VCO phase 0, or REFBUF if in VCO bypass mode (post-DELAYider phase-shift)   |
| CLKOS4_CPHASE       | "1" (default)                    | Delay E section output DELE VCO clock cycles with respect to VCO phase 0, or REFBUF if in VCO bypass mode (post-DELAYider phase-shift)   |
| CLKOS5_CPHASE       | "1" (default)                    | Delay F section output DELF VCO clock cycles with respect to VCO phase 0, or REFBUF if in VCO bypass mode (post-divider phase-shift)     |
| CLKOPHY_CPHASE      | "1" (default)                    | Delay F section output DELPHY VCO clock cycles with respect to VCO phase 0, or REFBUF if in VCO bypass mode (post-divider phase-shift)   |
| CLKRES_CPHASE       | "1" (default)                    | Delay RES section output DELRES VCO clock cycles with respect to VCO phase 0, or REFBUF if in VCO bypass mode (post-divider phase-shift) |
| FAST_LOCK           | "ENABLED" (default)              | Fast lock enable0: disabled; 1: enabled                                                                                                  |
| LOSS_LOCK_DETECTION | "ENABLED" (default)              | 1b1 enable cycle slip detection                                                                                                          |
| CLKI_DIV            | "8" (default)                    | Reference clock divider; NR=CLKR[5:0]+1, CLKR[0] is LSB                                                                                  |
| CLKI_SEL            | "REFMUX0" (default)              | Static setting (Immi version) of refin_sel (CIB) from REFMUX0 or REFMUX1                                                                 |
| CLKFB_DIV           | "2" (default)                    | Feedback clock divider; CLKF[25:14]                                                                                                      |
| FRACTIONAL_FBK      | "0b00000000000000" (default)     | Precise & SSC fractional multiplication                                                                                                  |
| CLKFB_PATH          | "EXTERNAL" (default)             | Feedback path0: external feedback1: the internal feedback is selected                                                                    |
| EXT_FB_DELAY        | "0b00" (default)                 | Determine the output enable delayed time for external feedback mode                                                                      |
| LOOP_BW             | "0b000000000000" (default)       | Loop BW control.: NB=BWADJ[11:0]+1, BWADJ[0] is LSB                                                                                      |
| CLKV_SSC_SLOPE      | "0b000000000000000000" (default) | SSC Slope multiplier                                                                                                                     |

**Table 748: Parameters (Continued)**

| <b>Name</b>    | <b>Values</b>              | <b>Description</b>                                                                |
|----------------|----------------------------|-----------------------------------------------------------------------------------|
| CLKS_SSC_RATE  | "0b000000000000" (default) | SSC rate multiplier                                                               |
| SCC_SS         | "DISABLED" (default)       | Enable or disable the Spread Spectrum0: disabled; 1: enabled                      |
| SCC_FRACTIONAL | "DISABLED" (default)       | Enable fractional accumulation. 0: disabled; 1: enabled                           |
| CLKOP_DIV      | "8" (default)              | CLKOP Divider Setting, BFD bit setting is user primitive DIV bit stting = value-1 |
| CLKOS_DIV      | "8" (default)              | CLKOS Divider Setting                                                             |
| CLKOS2_DIV     | "8" (default)              | CLKOS2 Divider Setting                                                            |
| CLKOS3_DIV     | "8" (default)              | CLKOS3 Divider Setting                                                            |
| CLKOS4_DIV     | "8" (default)              | CLKOS4 Divider Setting                                                            |
| CLKOS5_DIV     | "8" (default)              | CLKOS5 Divider Setting                                                            |
| CLKPHY_DIV     | "1" (default)              | CLKPHY Divider Setting                                                            |
| INT_CLK7_DIV   | "8" (default)              | CLK7 Divider Setting                                                              |
| CLKRES_DIV     | "8" (default)              | CLKRES Divider Setting                                                            |
| SATURATION     | "ENABLED" (default)        | Saturation behavior enable0: disabled; 1: enabled                                 |
| EN_PLL         | "DISABLED" (default)       | 1b1 to select GPLL IP                                                             |
| EN_PLLRESET    | "DISABLED" (default)       | 1b1 to enable pllreset control (cib port)                                         |
| EN_CLKOP       | "YES" (default)            | Enable CLKOP (DIVA) clock output 0: DISABLED (NO); 1: ENABLED (YES)               |
| EN_CLKOS       | "YES" (default)            | Enable CLKOS (DIVB) clock output 0: DISABLED; 1: ENABLED                          |
| EN_CLKOS2      | "YES" (default)            | Enable CLKOS2 (DIVC) clock output 0: DISABLED; 1: ENABLED                         |
| EN_CLKOS3      | "YES" (default)            | Enable CLKOS3 (DIVD) clock output 0: DISABLED; 1: ENABLED                         |
| EN_CLKOS4      | "YES" (default)            | Enable CLKOS4 (DIVE) clock output 0: DISABLED; 1: ENABLED                         |
| EN_CLKOS5      | "YES" (default)            | Enable CLKOS5 (DIVF) clock output0: DISABLED; 1: ENABLED                          |
| EN_CLKPHY      | "YES" (default)            | Enable CLKPHY (DIVY) clock output 0: DISABLED; 1: ENABLED                         |
| EN_CLKRES      | "NO" (default)             | Enable CLKRES clock output                                                        |
| EN_CLKOP_OUT   | "OFF" (default)            | Output CLKOP 0: ON: 1: OFF                                                        |
| EN_CLKOS_OUT   | "OFF" (default)            | Output CLKOS0: ON;1: OFF                                                          |
| EN_CLKOS2_OUT  | "OFF" (default)            | Output CLKOS20: ON:1: OFF                                                         |

**Table 748: Parameters (Continued)**

| Name                 | Values               | Description                            |
|----------------------|----------------------|----------------------------------------|
| EN_CLKOS3_OUT        | "OFF" (default)      | Output CLKOS30: ON; 1: OFF             |
| EN_CLKOS4_OUT        | "OFF" (default)      | Output CLKOS40: ON; 1: OFF             |
| EN_CLKOS5_OUT        | "OFF" (default)      | Output CLKOS50: ON; 1: OFF             |
| EN_CLKPHY_OUT        | "OFF" (default)      | Output CLKPHY0: ON; 1: OFF             |
| EN_CLKRES_OUT        | "OFF" (default)      | Output CLKRES: ON; 1: OFF              |
| CONFIG_WAIT_FOR_LOCK | "DISABLED" (default) | Wait for PLL lock during configuration |

## PLLREFCS

PLL Dynamic Reference Clock Switching

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T

**Table 749: Input Ports**

| Name | Range | Description                                                                                                                                             |
|------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLK0 | 1     | There are two clock input MUXES (8 inputs each) which are labeled as REFCLK1 and REFCLK2. CLK0 is the output of REFCLK1. CLK1 is the output of REFCLK2. |
| CLK1 | 1     | Input clock 1                                                                                                                                           |
| SEL  | 1     | Selects which signal goes to the input clock MUX.                                                                                                       |

**Table 750: Output Ports**

| Name     | Range | Description  |
|----------|-------|--------------|
| PLLCSOUT | 1     | Clock output |

The PLLREFCS primitive is used to support the dynamic reference clock switching using the SEL signal. This primitive does not require a wrapper.

You only need to instantiate the PLLREFCS primitive if you want to select between two different reference clocks in your application. If you only use one reference clock for the PLL, the software will automatically make the correct connections.

## PLLREFCSA

2:1 mux with dynamic select

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 751: Input Ports**

| Name | Range | Type    | Active State | Description                              |
|------|-------|---------|--------------|------------------------------------------|
| CLK0 | 1     | Clock   | Rising Edge  | CLK0 input                               |
| CLK1 | 1     | Clock   | Rising Edge  | CLK1 input                               |
| SEL  | 1     | Control | High         | Select the CLK0 (SEL=0) and CLK1 (SEL=1) |

**Table 752: Output Ports**

| Name     | Range | Type  | Active State | Description  |
|----------|-------|-------|--------------|--------------|
| PLLCSOUT | 1     | Clock | N/A          | Clock output |

## PLLREFCSB

PLL Dynamic Reference Clock Switching

Architectures Supported:

- ▶ LFMXO4

**Table 753: Input Ports**

| Name | Range | Description                                                                                                                                             |
|------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLK  | 1:0   | There are two clock input MUXES (8 inputs each) which are labeled as REFCLK1 and REFCLK2. CLK0 is the output of REFCLK1. CLK1 is the output of REFCLK2. |
| SEL  | 1     | Selects which signal goes to the input clock MUX.                                                                                                       |

**Table 754: Output Ports**

| Name     | Range | Description  |
|----------|-------|--------------|
| PLLCSOUT | 1     | Clock output |

**Description**

The PLLREFCSB primitive is used to support the dynamic reference clock switching using the SEL signal. This primitive does not require a wrapper.

You only need to instantiate the PLLREFCSB primitive if you want to select between two different reference clocks in your application. If you only use one reference clock for the PLL, the software will automatically make the correct connections.

For more information, refer to related technical notes on the Lattice web site.

**PUR**

Power Up Set/Reset

Architectures Supported:

▶ LFMXO4

**Table 755: Input Ports**

| Name | Range | Description    |
|------|-------|----------------|
| PUR  | 1     | Power-Up Reset |

**Table 756: Parameters**

| Name      | Values | Description |
|-----------|--------|-------------|
| RST_PULSE | "1"    | Reset Pulse |

### Description

PUR is used to reset or set all register elements in your design upon device configuration/startup. The PUR component can be connected to a net from an input buffer or an internally generated net. It is active LOW and when pulsed will set or reset all register bits to the same state as the local set or reset functionality.

It is not necessary to connect signals for PUR to any register elements explicitly. The function will be implicitly connected globally.

## RGB

RGB LED drive module, containing three open drain I/O pins for RGB LED outputs.

Architectures supported:

- ▶ iCE40 UltraPlus

**Table 757: Input Ports**

| Name     | Description                                                                                                                      |
|----------|----------------------------------------------------------------------------------------------------------------------------------|
| CURREN   | Enable reference current to IR drivers. Enabling the drivers takes 100us to reach a stable reference current value. Active high. |
| RGBLEDEN | Enable the RGB driver. Active high.                                                                                              |
| RGB0PWM  | Input data to drive RGB0 LED pin.                                                                                                |
| RGB1PWM  | Input data to drive RGB1 LED pin.                                                                                                |
| RGB2PWM  | Input data to drive RGB2 LED pin.                                                                                                |

**Table 758: Output Ports**

| Name | Description      |
|------|------------------|
| RGB2 | RGB2 LED output. |
| RGB1 | RGB1 LED output. |
| RGB0 | RGB0 LED output. |

| LEDDCLK               | Write clock.                                                                                             |
| LEDDDAT7...LEDDDAT0   | Data input.                                                                                              |
| LEDDADDR3...LEDDADDR0 | Data address.                                                                                            |
| LEDDDEN               | Data enable input to indicate data and address are stable.                                               |
| LEDDEXE               | Enable the IP to run the blinking sequence. When it is low, the sequence stops at the nearest OFF state. |

**Table 767: Output Ports**

| Name              | Description              |
|-------------------|--------------------------|
| PWMOUT2...PWMOUT0 | PWM outputs.             |
| LEDDON            | Indicates the LED is on. |

SAME AS: SB\_LEDDA\_IP

## SEDFA

Soft Error Detect in Basic Mode

Architectures Supported:

- ▶ LFMXO4

### Description

The Soft-Error Detect (SED) circuitry provides a method for the device to check its configuration data for soft-errors. SEDFA is used for SED basic mode.

**Table 789: Input Ports**

| Name      | Range | Description                                              |
|-----------|-------|----------------------------------------------------------|
| SEDSTDBY  | 1     | SED standby.                                             |
| SEDENABLE | 1     | SED enable (a Low clears the SED).                       |
| SEDSTART  | 1     | Error detection start (sampled at positive clock edge).  |
| SEDFRCERR | 1     | Force an SED error flag (e.g. for testing), active high. |

**Table 790: Output Ports**

| Name      | Range | Description                             |
|-----------|-------|-----------------------------------------|
| SEDINPROG | 1     | SED cycle is in progress, asserts High. |
| SEDDONE   | 1     | SED cycle is complete, asserts High.    |
| SEDERR    | 1     | SED error flag, asserts High.           |
| SEDCLKOUT | 1     | Optional clock output.                  |

**Table 791: Parameters**

| Name         | Value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Description         |

You can refer to related technical notes on the Lattice web site for more information and usage.

## SEDFB

Soft Error Detect in One Shot Mode

Architectures Supported:

- ▶ LFMX04

**Table 792: Output Ports**

| Name      | Range | Description                             |
|-----------|-------|-----------------------------------------|
| SEDINPROG | 1     | SED cycle is in progress, asserts High. |
| SEDDONE   | 1     | SED cycle is complete, asserts High.    |
| SEDERR    | 1     | SED error flag, asserts High.           |
| SEDCLKOUT | 1     | Optional clock output.                  |

### Description

The Soft-Error Detect (SED) circuitry provides a method for the device to check its configuration data for soft-errors. SEDFB is used for One Shot SED mode.

You can refer to related technical notes on the Lattice web site for more information and usage.

## SEIO18

Single Ended I/O block for 1.8V

Architectures supported:

- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5D
- ▶ LFMXO5-25
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL

**Table 793: Input Ports**

| Name  | Description                              |
|-------|------------------------------------------|
| PADD0 | Data output from fabric to IO pad        |
| DOLP  | Data output for MIPI low-power mode      |
| PADDT | Data tri-state control; high = tri-state |

**Table 794: Output Ports**

| Name  | Description                        |
|-------|------------------------------------|
| PADDI | Data input from IO pad to fabric   |
| INLP  | Data input for MIPI low-power mode |
| INADC | Output to ADC                      |

**Table 795: Bidirectional Ports**

| Name  | Description       |
|-------|-------------------|
| IOPAD | IO Pad connection |

**Table 796: Parameters**

| Name     | Values                                                                | Description                      |
|----------|-----------------------------------------------------------------------|----------------------------------|
| PULLMODE | "DOWN" ( <i>default</i> )<br>"NONE"<br>"UP"<br>"KEEPER"<br>"FAILSAFE" | Enables pullup and pulldown mode |
| ENADC_IN | "DISABLED" ( <i>default</i> )<br>"ENABLED"                            | Enables pad A path to adc block  |
| MIPI     | "DISABLED" ( <i>default</i> )<br>"ENABLED"                            | Enable MIPI_DPHY IO TYPE         |

## SEIO18A

Single Ended I/O block for 1.8V

Architectures supported:

- ▶ LFCPNX
- ▶ LFMXO5T
- ▶ LFMXO5TD
- ▶ UT24CP

**Table 797: Input Ports**

| Name     | Description                                                                                                                                                                                                                                                                                                                                          |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PADD0    | HS Data out to PAD                                                                                                                                                                                                                                                                                                                                   |
| DOLP     | LP Data out to PAD                                                                                                                                                                                                                                                                                                                                   |
| PADDT    | Tri-state input signals to IO A,<br>0: driver output enabled<br>1: diver enabled to tri-state(high-Z) output                                                                                                                                                                                                                                         |
| IVREF_IN | Internal Receiver Reference Voltage Input. Each bank will support 3 VREF analog input voltages for flexibility to receive three different referenced input levels on the same bank. VREFs are used to set the threshold for the referenced input receiver. Each referenced receiver has a programmable option to select VREF1/2 and a internal VREF. |

**Table 798: Output Ports**

| Name  | Description                           |
|-------|---------------------------------------|
| PADDI | Data in                               |
| INLP  | MIPI LP RX output                     |
| INADC | Output to ADC through switch from PAD |

**Table 799: Bidirectional Ports**

| Name  | Description                                             |
|-------|---------------------------------------------------------|
| IOPAD | A virtual port, which is connected to the external pad. |

**Table 800: Parameters**

| Name     | Values                                      | Description                     |

| PULLMODE | "DOWN" ( <i>default</i> )<br>"NONE"<br>"UP" | Pull mode                       |
| ENADC_IN | "DISABLED" ( <i>default</i> )<br>"ENABLED"  | Enables pad A path to adc block |
| MIPI     | "DISABLED" ( <i>default</i> )<br>"ENABLED"  | MIPI usage                      |

## SEIO33

Single Ended I/O Block for 3.3V

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 801: Input Ports**

| Name     | Description                              |
|----------|------------------------------------------|
| PADD0    | Data output from fabric to IO pad        |
| PADDT    | Data tri-state control; high = tri-state |
| I3CRESEN | I3C resistor enable                      |
| I3CWKPU  | I3C weak pullup enable                   |

**Table 802: Output Ports**

| Name  | Description                      |
|-------|----------------------------------|
| PADDI | Data input from IO pad to fabric |

**Table 803: Bidirectional Ports**

| Name  | Description       |
|-------|-------------------|
| IOPAD | IO Pad connection |

**Table 804: Parameters**

| Name     | Values                    | Description     |
|----------|---------------------------|-----------------|
| PULLMODE | "DOWN" ( <i>default</i> ) | Pull down       |
|          | "NONE"                    | No pull up/down |
|          | "UP"                      | Pull up         |

**Table 804: Parameters**

| Name | Values     | Description                                                                                                                                       |
|------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
|      | "KEEPER"   | Retain the last state if bus connected to this IO goes to tri-state.                                                                              |
|      | "FAILSAFE" | For differential IOs, uses a weak pullup on the "true" pad and a weak pulldown on the "complement" pad to give a determinate value when undriven. |

## SGMIICDR

SGMII stands for Serial Gigabit Media Independent Interface, widely used for the interface to a discrete Ethernet PHY chip, it is defined as a 1.25 Gbps DDR interface with both clock and data pairs.

### Note:

You should not try to use this primitive directly. Instead, use the related IP in IP Catalog. The following information is for reference only.

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL-40
- ▶ LIFCL-17
- ▶ UT24C
- ▶ UT24CP

**Table 805: Input Ports**

| Name        | Range | Description                                                                        |
|-------------|-------|------------------------------------------------------------------------------------|
| LMMICK      | 1     | Clock for LMMI interface                                                           |
| LMMIRESET_N | 1     | LMMI Reset                                                                         |
| LMMIREQUEST | 1     | LMMI request                                                                       |
| LMMIWRRD_N  | 1     | LMMI write-high/read-low from fabric                                               |
| LMMIOFFSET  | 3:0   | LMMI Offset                                                                        |
| LMMIWDATA   | 7:0   | LMMI Write Data                                                                    |
| DCALIRST    | 1     | Reset signal to trigger the DCO calibration process when it is necessary           |
| DFACQRST    | 1     | Reset signal to trigger the DCO frequency acquisition process when it is necessary |
| RRST        | 1     | Reset for the SGMII CDR IP                                                         |
| SPCLK       | 1     | 125MHz Fabric clock                                                                |
| RSTBFBW     | 1     | FIFO write reset                                                                   |
| RSTBRXF     | 1     | FIFO read reset                                                                    |
| SGMIIIN     | 1     | 125MHz reference clock                                                             |
| SREFCLK     | 1     | 125MHz reference clock                                                             |

**Table 806: Output Ports**

| Name           | Range | Description                                                    |
|----------------|-------|----------------------------------------------------------------|
| LMMIRDATA      | 7:0   | Read data                                                      |
| LMMIRDATAVALID | 1     | Read transaction is complete and LMMIRDATA contains valid data |
| LMMIREADY      | 1     | LMML ready signal                                              |
| SRCLK          | 1     | 125MHz recovered byte clock to Fabric                          |
| SRXD           | 9:0   | 10-bit parallel data to Fabric                                 |
| CDRLOL         | 1     | CDR loss of lock                                               |

## SGSR

Synchronous GSR Primitive

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 808: Input Ports**

| Name  | Range | Description              |
|-------|-------|--------------------------|
| GSR_N | 1     | User GSR input           |
| CLK   | 1     | User clock for sync mode |

## SGSRA

### Note:

The SGSR primitive needs to be instantiated in the user design.

Synchronous Release Global Set/Reset Interface

Architectures Supported:

- ▶ LFMXO4

### Description

SGSR is used to reset or set all register elements in your design. The SGSR component can be connected to a net from an input buffer or an internally generated net. It is active LOW and when pulsed will set or reset all flip-flops, latches, registers, and counters to the same state as the local set or reset functionality. When input GSR is HIGH, the global signal is released at the positive edge of the clock (CLK).

It is not necessary to connect signals for SGSR to any register elements explicitly. The function will be implicitly connected globally. The functionality of the SGSR for sequential cells without a local set or reset are described in the appropriate library help page.

**Table 809: Input Ports**

| Name | Range | Description |
|------|-------|-------------|
| GSR  | 1     | GSR input   |
| CLK  | 1     | Clock input |

## SLICEMUX

Architectures Supported:

- ▶ LFMXO4

**Table 810: Input Ports**

| Name | Range | Description |
|------|-------|-------------|
| D1   | 1     | Data input  |
| D0   | 1     | Data input  |
| SEL  | 1     | Data select |

**Table 811: Output Ports**

| Name | Range | Description |
|------|-------|-------------|
| Z    | 1     | Data output |

## SP16K

16 kb Single Port Block RAM

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 812: Input Ports**

| Name | Range | Description           |
|------|-------|-----------------------|

| RESETMODE               | "SYNC" ( <i>default</i> )<br>"ASYN"                      | Reset mode                                       |
| GSR                     | "ENABLED" ( <i>default</i> )<br>"DISABLED"               | Enable global set/reset for the output registers |
| INITVAL_00...INITVAL_3F | Hex string, 320 bits, must include the "0x" prefix       | EBR initialization data                          |

**Table 814: Parameters**

| Name              | Values                                                                  | Description                                           |
|-------------------|-------------------------------------------------------------------------|-------------------------------------------------------|
| CSDECODE          | 000 ( <i>default</i> )<br>001<br>010<br>011<br>100<br>101<br>110<br>111 | Chip select active setting                            |
| ASYNC_RST_RELEASE | "SYNC" ( <i>default</i> )<br>"ASYNC"                                    | Reset release mode                                    |
| INIT_DATA         | "STATIC" ( <i>default</i> )<br>"DYNAMIC"<br>"NO_INIT"                   | Defines whether or not the memory file can be updated |

**Note:**

All inputs (except the register control signals) and all outputs are registered in the following manner:

Port assignments for different data widths will follow the table below:

| Data Width | Input Data | Output Data | Address (MSB to LSB) |
|------------|------------|-------------|----------------------|
| 16Kx1      | DI[0]      | DO[0]       | AD[13:0]             |
| 8Kx2       | DI[1:0]    | DO[1:0]     | AD[13:1]             |
| 4Kx4       | DI[3:0]    | DO[3:0]     | AD[13:2]             |
| 2Kx9       | DI[8:0]    | DO[8:0]     | AD[13:3]             |
| 1Kx18      | DI[17:0]   | DO[17:0]    | AD[13:4]             |

For data widths that do not use all available address bits, the unused bits **must** be tied high for proper functionality.

The initial value of the memory may be given in the INITVAL property. The format is little endian, with bytes (up to 9 bytes) packed as follows, where byte[n] is the most significant byte and byte[0] is the least significant byte:

INITVAL\_XX = { {0, byte[n]}, {0, byte[n-1]}, ... {0, byte[1]}, {0, byte[0]} }

## SP16KA

## SP256K

Single Port RAM that can be configured in 16K x 16 mode. This block can be cascaded using logic implemented in fabric to create larger memories.

Architectures supported:

- ▶ iCE40 UltraPlus

**Table 821: Input Ports**

| Name   | Range | Description                                                                                                                                                                     |
|--------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AD     | 13:0  | This Address input port is used to address the location to be written during the write cycle and read during the read cycle.                                                    |
| DI     | 15:0  | The data input bus used to write the data into the memory location specified by address input port during the write cycle.                                                      |
| MASKWE | 3:0   | The Bit Write feature where selective write to individual I/O's can be done using the Maskable Write Enable signals. Each bit masks a nibble of DI.                             |
| WE     | 1     | When the Write Enable input is Logic High, the memory is in the write cycle. When the Write enable is Logic Low, the memory is in the Read Cycle.                               |
| CS     | 1     | When the memory enable input is Logic High, the memory is enabled and read/write operations can be performed. When memory Enable input is logic Low, the memory is deactivated. |
| CK     | 1     | This is the external clock for the memory.                                                                                                                                      |
| STDBY  | 1     | When this pin is active then memory goes into low leakage mode, there is no change in the output state.                                                                         |

**Table 821: Input Ports (Continued)**

| Name     | Range | Description                                                                                                                                                                            |
|----------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SLEEP    | 1     | This pin shut down power to periphery and maintain memory contents. The outputs of the memory are pulled low.                                                                          |
| PWROFF_N | 1     | This pin turns off the power to the memory core when it is driven low. There is no memory data retention when it is driven low. When PWROFF_N is driven high, the SPRAM is powered on. |

**Table 822: Output Ports**

| Name | Value | Description                                                                            |
|------|-------|----------------------------------------------------------------------------------------|
| DO   | 15:0  | It outputs the contents of the memory location addressed by the Address Input signals. |

## SP512K

512Kb Single Port Block RAM

Architectures supported:

| Name     | Range | Description                                                                                                                 |
|----------|-------|-----------------------------------------------------------------------------------------------------------------------------|
| DI       | 31:0  | Data in                                                                                                                     |
| AD       | 13:0  | Address                                                                                                                     |
| CLK      | 1     | Clock                                                                                                                       |
| CE       | 1     | Clock enable                                                                                                                |
| WE       | 1     | Write enable                                                                                                                |
| CS       | 1     | Chip select                                                                                                                 |
| RSTOUT   | 1     | Output register reset                                                                                                       |
| CEOUT    | 1     | Output register clock enable                                                                                                |
| BYTEEN_N | 3:0   | Write byte enable: 0=enable, 1=disable.<br>BYTEEN_N[3] corresponds to the MSB of DI.<br>BYTEEN_N[0] corresponds to the LSB. |

**Table 824: Output Ports**

| Name    | Range | Description                     |
|---------|-------|---------------------------------|
| DDO     | 31:0  | Data out                        |
| ERRDECA | 1:0   | Port A 1- and 2-bit error flag. |
| ERRDECB | 1:0   | Port B 1- and 2-bit error flag. |

**Table 825: Parameters**

| Name                    | Values                                                    | Description                                                      |
|-------------------------|-----------------------------------------------------------|------------------------------------------------------------------|
| OUTREG                  | "NO_REG" ( <i>default</i> )<br>"OUT_REG"                  | Register output                                                  |
| GSR                     | "GSR_EN" ( <i>default</i> )<br>"GSR_DIS"                  | Enable global set/reset                                          |
| RESETMODE               | "SYNC" ( <i>default</i> )<br>"ASYNC"                      | Reset sync/async control                                         |
| INITVAL_00...INITVAL_7F | Hex string, 5120 bits,<br>must include the "0x"<br>prefix | Specifies the initialization<br>value for RAM type<br>primitives |
| ASYNC_RESET_RELEASE     | "SYNC" ( <i>default</i> )<br>"ASYNC"                      | Reset release sync/async                                         |
| ECC_BYTE_SEL            | "BYTE_EN"<br>"ECC_EN" ( <i>default</i> )                  | Error Correction Code Byte<br>Select                             |

**Note:**

All inputs (except the register control signals) and all outputs are registered in the following manner:

**SP8KC**

8K Single Port Block RAM

Architectures Supported:

- ▶ LFMXO4

**Table 826: Input Ports**

| Name | Range | Description         |
|------|-------|---------------------|
| CE   | 1     | Clock enable        |
| OCE  | 1     | Output clock enable |
| CLK  | 1     | Clock               |
| WE   | 1     | Write enable        |
| RST  | 1     | Reset               |
| CS   | 2:0   | Chip select         |
| AD   | 12:0  | Address bus         |
| DI   | 8:0   | Input data          |

**Table 827: Output Ports**

| Name    | Range | Description |
|---------|-------|-------------|
| DO[8:0] | 8:0   | Read data   |

**Table 828: Parameters**

| Name       | Values                       | Description                                           |
|------------|------------------------------|-------------------------------------------------------|
| DATA_WIDTH | "1", "2", "4", "9" (default) | Data word width. Attached to a memory type primitive. |
| REGMODE    | "NOREG" (default), "OUTREG"  | Specifies the register mode for pipelining.           |

**Table 828: Parameters**

| Name                        | Values                                                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------|---------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RESETMODE                   | "SYNC" (default),<br>"ASYNCR"                                                               | Reset type. This attribute is attached to a block RAM-type primitive that has a memory size smaller than 9 bits. When set to SYNC, the memory reset is synchronized with the clock. When set to ASYNCR, the memory reset is asynchronous to the clock.                                                                                                                                                                                               |
| CSDECODE                    | "0b000"                                                                                     | Attached to a single-port block RAM primitive. The CSDECODE value determines the decoding value of CS[2:0]. A value set to "000" means that the memory is selected if CS[2:0]=1'B000.                                                                                                                                                                                                                                                                |
| WRITEMODE                   | "NORMAL" (default),<br>"WRITETHROUGH",<br>"READBEFORE"                                      | Read/Write mode.<br>Attached to a dual- and single-port RAM primitive.                                                                                                                                                                                                                                                                                                                                                                               |
| GSR                         | "ENABLED" (default),<br>"DISABLED"                                                          | Enables or disables the Global Set/Reset (GSR) for all registered primitives. Applicable to registers, PLLs, and memories such as SP8KA and DP8KA.                                                                                                                                                                                                                                                                                                   |
| INIT_DATA                   | "STATIC" (default),<br>"DYNAMIC"                                                            | Specifies if the initialization data (as defined by the INITVAL parameters) may be changed after the synthesis stage.<br><br>When INIT_DATA=STATIC, it is assumed that the initialization data will not change after synthesis, so an optimization to reduce the bitstream size can be applied.<br><br>When INIT_DATA=DYNAMIC it is assumed that the initialization data may change after synthesis, so the aforementioned optimization is disabled. |
| INITVAL_00 to<br>INITVAL_1F | "0x0000000000000000<br>0000000000000000<br>0000000000000000<br>0000000000000000<br>0000000" | Initialization value                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## SPI\_B

Hard SPI interface

Architectures supported:

## ▶ iCE40 UltraPlus

**Table 829: Input Ports**

| Name              | Description                           |
|-------------------|---------------------------------------|
| SBCLKI            | System clock input.                   |
| SBRWI             | System read/write input.              |
| SBSTBI            | Strobe signal.                        |
| SBADRI7...SBADRI0 | System bus control registers address. |
| SBDATI7...SBDATI0 | System data input.                    |
| MI                | Master input from PAD.                |
| SI                | Slave input from PAD.                 |
| SCKI              | Slave clock input from PAD.           |
| SCSNI             | Slave chip select input from PAD.     |

**Table 830: Output Ports**

| Name              | Description           |
|-------------------|-----------------------|
| SBDATO7...SBDATO0 | System data output.   |
| SBACKO            | System acknowledgment |

**Table 830: Output Ports (Continued)**

| Name              | Description                              |
|-------------------|------------------------------------------|
| SPIIRQ            | SPI interrupt output                     |
| SPIWKUP           | SPI wake up from standby signal          |
| SO                | Slave output to PAD                      |
| SOE               | Slave output enable to PAD. Active high  |
| MO                | Master output to PAD                     |
| MOE               | Master output enable to PAD. Active high |
| SCKO              | Slave clock output to PAD                |
| SCKOE             | Slave clock output enable to PAD         |
| MCSNO3...MCSNO0   | Master chip select output to PAD         |
| MCSNOE3...MCSNOE0 | Master chip select output enable to PAD  |

**Table 831: Parameters**

| Name                 | Values                                                                                                                                                                                                                                                                                                                                                                                                                                          | Description                                                                                                                                     |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| BUS_ADDR74           | "0'b0000" ( <i>default</i> ),<br>"0'b0010".                                                                                                                                                                                                                                                                                                                                                                                                     | Fixed value. Upper left corner should be 0'b0000. Upper right corner should be 0'b0010. SBARDI[7:4] should match this value to activate the IP. |
| SPI_CLK_DIVIDER      | "0" ( <i>default</i> ),<br>"1", "2", "3", "4", "5", "6",<br>"7", "8", "9", "10", "11",<br>"12", "13", "14", "15", "16",<br>"17", "18", "19", "20", "21",<br>"22", "23", "24", "25", "26",<br>"27", "28", "29", "30", "31",<br>"32", "33", "34", "35", "36",<br>"37", "38", "39", "40", "41",<br>"42", "43", "44", "45", "46",<br>"47", "48", "49", "50", "51",<br>"52", "53", "54", "55", "56",<br>"57", "58", "59", "60", "61",<br>"62", "63". | Ratio of SCBLKI/SCKO.                                                                                                                           |
| FREQUENCY_PIN_SBCLKI | "NONE" ( <i>default</i> )                                                                                                                                                                                                                                                                                                                                                                                                                       | SDC constraint entry on SBCLKI port of SPI.                                                                                                     |

## SPR16X4

Distributed Single Port RAM with Synchronous Write and Asynchronous Read

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 832: Input Ports**

| Name | Range | Description        |
|------|-------|--------------------|
| DI   | 3:0   | Data in            |
| AD   | 3:0   | Read/write address |
| CK   | 1     | Write clock        |
| WRE  | 1     | Write enable       |

**Table 833: Output Ports**

| Name | Range | Description |
|------|-------|-------------|
| DO   | 3:0   | Data out    |

**Table 834: Parameters**

| Name    | Values                            | Description                           |
|---------|-----------------------------------|---------------------------------------|
| INITVAL | "0x0000000000000000"<br>(default) | 16-digit hex string,<br>64 bits total |

## SPR16X4A

Distributed Single Port RAM. Synchronous write, asynchronous read

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 835: Input Ports**

| Name | Range | Type    | Description  |
|------|-------|---------|--------------|
| DI   | 3:0   | Data    | Write data   |
| WCK  | 1     | Clock   | Write clock  |
| WRE  | 1     | Control | Write enable |
| AD   | 3:0   | Addr    | Address      |

**Table 836: Output Ports**

| Name | Range | Type | Description |
|------|-------|------|-------------|
| DO   | 3:0   | Data | Read data   |

**Table 837: Parameters**

| Name    | Values                                  | Description              |
|---------|-----------------------------------------|--------------------------|
| INITVAL | "0x0000000000000000" ( <i>default</i> ) | RAM initialization value |

## SPR16X4C

PFU based distributed Single Port RAM

Architectures Supported:

▶ LFMXO4

**Table 838: Input Ports**

| Name | Range | Description        |
|------|-------|--------------------|
| DI3  | 1     | Input data         |

| DI0  | 1     | Input data         |
| AD3  | 1     | Read/Write address |
| AD2  | 1     | Read/Write address |
| AD1  | 1     | Read/Write address |
| AD0  | 1     | Read/Write address |
| CK   | 1     | Write clock        |
| WRE  | 1     | Write enable       |

**Table 839: Output Ports**

| Name | Range | Description |
|------|-------|-------------|
| DO3  | 1     | Read data   |
| DO2  | 1     | Read data   |
| DO1  | 1     | Read data   |
| DO0  | 1     | Read data   |

**Table 840: Parameters**

| Name    | Values               | Description          |
|---------|----------------------|----------------------|
| INITVAL | "0x0000000000000000" | Initialization value |

## SPR32X2

Distributed Single Port RAM. Synchronous write, asynchronous read

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 841: Input Ports**

| Name | Range | Type    | Description  |
|------|-------|---------|--------------|
| DI   | 1:0   | Data    | Write data   |
| WCK  | 1     | Clock   | Write clock  |
| WRE  | 1     | Control | Write enable |
| AD   | 4:0   | Addr    | Address      |

**Table 842: Output Ports**

| Name | Range | Type | Description |
|------|-------|------|-------------|
| DO   | 1:0   | Data | Read data   |

**Table 843: Parameters**

| Name    | Values                                  | Description              |
|---------|-----------------------------------------|--------------------------|
| INITVAL | "0x0000000000000000" ( <i>default</i> ) | RAM initialization value |

## START

Startup Controller

Architectures Supported:

▶ LFMXO4

### Description

This primitive determines the user clock for the Wake up sequence. You can instantiate this module in your HDL source to tie a specific user clock to be used in the wake-up sequence instead of the TCK (JTAG), BCLK (SDM), or MCLK/CCLK (sysCONFIG).

**Table 844: Input Ports**

| Name     | Range | Description |
|----------|-------|-------------|
| STARTCLK | 1     | Start clock |

**START Usage with Verilog HDL**

```
module START (STARTCLK);
input  STARTCLK;
endmodule
```

**START Usage with VHDL**

```
COMPONENT START
  PORT (
    STARTCLK      :  IN STD_ULOGIC
  );
END COMPONENT;
```

**TSALL**

Global Tristate Interface

Architectures Supported:

▶ LFMXO4

**Table 845: Input Ports**

| Name  | Range | Description        |
|-------|-------|--------------------|
| TSALL | 1     | TSALLN for MachXO4 |

**Description**

TSALL is used to tristate buffers in your design. The TSALL component is connected to a net to drive all output and bidirectional buffers into a HIGH impedance state when active HIGH.

It is not necessary to connect signals to buffers explicitly. The function will be implicitly connected globally.

**Note**

The TSALL component may be driven by general FPGA logic or by the read-configuration block. In the latter case, the TSALL block must be driven by a buffer located at the RDCFGN pin. When locating the TSALL to the RDCFGN, you must do this by explicitly designating "RDCFGN" in the attribute. Check with customer support or with FAEs for more details.

---

## TSALLA

Global Tristate Interface

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 846: Input Ports**

| Name  | Range | Description           |
|-------|-------|-----------------------|
| TSALL | 1     | Tri-State All Control |

TSALLA is used to tristate buffers in your design. The TSALLA component is connected to a net to drive all output and bidirectional buffers into a HIGH impedance state when active HIGH.

It is not necessary to connect signals to buffers explicitly. The function will be implicitly connected globally.

## TSALLB

Tri-state all PIO outputs and bidirectional PIO

Architectures supported:

- ▶ LAV-AT-ES1
- ▶ LN2-CT

**Table 847: Input Ports**

| Name  | Range | Description                                            |
|-------|-------|--------------------------------------------------------|
| TSALL | 1     | Tri-state control to all outputs and bidirectional PIO |

## TSHX2DQ

DQ tristate control for DDR2 & DDR3 memory

Architectures supported:

- ▶ LFCPNX

- ▶ LFD2NX
- ▶ LFMXO5
- ▶ LIFCL-40,LIFCL-17
- ▶ UT24C
- ▶ UT24CP

This primitive is used to generate the tristate control for DQ data output for DDR3/DDR3L and LPDDR2/LPDDR3 memory interface with x2 gearing.

**Table 848: Input Ports**

| Name    | Description                                                           |
|---------|-----------------------------------------------------------------------|
| T0, T1  | Tristate input. T0 is output first, followed by T1.                   |
| DQSW270 | Clock that is 90° ahead of the clock used to generate the DQS output. |
| ECLK    | ECLK input.                                                           |
| SCLK    | Primary clock input (divide-by-2 of ECLK).                            |
| RST     | Reset input.                                                          |

**Table 849: Output Ports**

| Name | Description     |
|------|-----------------|
| Q    | Tristate output |

**Table 850: Parameters**

| Name | Values                                     | Description              |
|------|--------------------------------------------|--------------------------|
| GSR  | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable global set/reset. |

## TSHX2DQS

DQS tristate control for DDR2 & DDR3 memory

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFMXO5
- ▶ LIFCL-40,LIFCL-17
- ▶ UT24C
- ▶ UT24CP

This primitive is used to generate the tristate control for DQS output.

**Table 851: Input Ports**

| Name   | Description                                         |
|--------|-----------------------------------------------------|
| T0, T1 | Tristate input. T0 is output first, followed by T1. |
| DQSW   | DQSW includes write leveling phase shift from ECLK. |
| ECLK   | ECLK input.                                         |
| SCLK   | Primary clock input (divide-by-2 of ECLK).          |
| RST    | Reset input.                                        |

**Table 852: Output Ports**

| Name | Description     |
|------|-----------------|
| Q    | Tristate output |

**Table 853: Parameters**

| Name | Values                                     | Description              |
|------|--------------------------------------------|--------------------------|
| GSR  | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable global set/reset. |

## TSHX4DQ

DQ tristate control for DDR3 memory

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFMXO5
- ▶ LIFCL-40,LIFCL-17
- ▶ UT24C
- ▶ UT24CP

This primitive is used to generate the tristate control for DQ data output for DDR3/DDR3L and LPDDR2/LPDDR3 memory interfaces with x4 gearing.

**Table 854: Input Ports**

| Name    | Range | Description                                                           |
|---------|-------|-----------------------------------------------------------------------|
| T       | 3     | Tristate input. T0 is output first, T3 last.                          |
| DQSW270 | 1     | Clock that is 90° ahead of the clock used to generate the DQS output. |
| ECLK    | 1     | ECLK input.                                                           |

**Table 854: Input Ports**

| Name | Range | Description                                |
|------|-------|--------------------------------------------|
| SCLK | 1     | Primary clock input (divide-by-4 of ECLK). |
| RST  | 1     | Reset input.                               |

**Table 855: Output Ports**

| Name | Range | Description     |
|------|-------|-----------------|
| Q    | 1     | Tristate output |

**Table 856: Parameters**

| Name | Values                                     | Description              |
|------|--------------------------------------------|--------------------------|
| GSR  | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable global set/reset. |

## TSHX4DQS

DQS tristate control for DDR3 memory

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFMXO5
- ▶ LIFCL-40,LIFCL-17
- ▶ UT24C
- ▶ UT24CP

This primitive is used to generate the tristate control for DQS output for DDR3/DDR3L and LPDDR2/LPDDR3 memory interfaces with x4 gearing.

**Table 857: Input Ports**

| Name | Range | Description                                         |
|------|-------|-----------------------------------------------------|
| T    | 3:0   | Tristate input. T0 is output first, T3 last.        |
| DQSW | 1     | DQSW includes write leveling phase shift from ECLK. |
| ECLK | 1     | ECLK input.                                         |
| SCLK | 1     | Primary clock input (divide-by-4 of ECLK).          |
| RST  | 1     | Reset input.                                        |

**Table 858: Output Ports**

| Name | Range | Description     |
|------|-------|-----------------|
| Q    | 1     | Tristate output |

**Table 859: Parameters**

| Name | Values                                     | Description              |
|------|--------------------------------------------|--------------------------|
| GSR  | "ENABLED" ( <i>default</i> )<br>"DISABLED" | Enable global set/reset. |

## USB23

The software interface of USB2.0 & USB3.0 hard IP.

▶ LIFCL-33U

| Name           | Range | Description                                   |
|----------------|-------|-----------------------------------------------|
| USB_SUSPENDCLK | 1     | Suspend clock for usb23 controller in LP mode |
| USB3_MCUCLK    | 1     | MCU clock for USB3 phy register setting       |
| USB_RESETN     | 1     | Global reset of usb23 controller from user    |
| USB3_SYSRSTN   | 1     | Global reset of usb3 phy from user            |
| USB2_RESET     | 1     | Global reset of usb2 phy from user            |
| LMMICLK        | 1     | Clock of Immi bus                             |
| LMMIRESETN     | 1     | Reset of Immi bus                             |
| LMMIREQUEST    | 1     | Request of Immi bus                           |
| LMMIWRRD_N     | 1     | Write or read of Immi bus                     |
| LMMIOFFSET     | 14:0  | Address of Immi bus                           |
| LMMIWDATA      | 31:0  | Data of Immi bus                              |
| XMAWREADY      | 1     | AXI bus for DMA                               |
| XMWREADY       | 1     | AXI bus for DMA                               |
| XMBID          | 7:0   | AXI bus for DMA                               |
| XMBVALID       | 1     | AXI bus for DMA                               |
| XMBRESP        | 1:0   | AXI bus for DMA                               |

**Table 860: Input Ports (Continued)**

| Name               | Range | Description                            |
|--------------------|-------|----------------------------------------|
| XMBMISC_INFO       | 3:0   | AXI bus for DMA                        |

|----------------------|--------------|
| DATAOUT15...DATAOUT0 | Data output. |

## VHI

Logic High Generator

Architectures supported:

- ▶ iCE40 UltraPlus
- ▶ LAV-AT-ES1
- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO4
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ LN2-CT
- ▶
- ▶ UT24C
- ▶ UT24CP

**Table 866: Output Ports**

| Name | Range | Description  |
|------|-------|--------------|
| Z    | 1     | VHI output Z |

## VLO

Logic Low Generator

Architectures supported:

- ▶ iCE40 UltraPlus
- ▶ LAV-AT-ES1
- ▶ LFCPNX
- ▶ LFD2NX

- ▶ LFD2NX-35
- ▶ LFD2NX-65
- ▶ LFMXO4
- ▶ LFMXO5
- ▶ LFMXO5-35T
- ▶ LFMXO5-65T
- ▶ LIFCL
- ▶ LN2-CT
- ▶
- ▶ UT24C
- ▶ UT24CP

**Table 867: Output Ports**

| Name | Range | Description  |
|------|-------|--------------|
| Z    | 1     | VLO output Z |

## WARMBOOT

Allows for loading a different configuration during run time

Architectures supported:

- ▶ iCE40 UltraPlus

**Table 868: Input Ports**

| Name    | Description                           |
|---------|---------------------------------------|
| S1...S0 | Select desired configuration image.   |
| BOOT    | Trigger the re-configuration process. |

## WDT

Interface for Configuration Watchdog Timer

Architectures supported:

- ▶ LFCPNX
- ▶ LFD2NX
- ▶ LFMXO5
- ▶ LIFCL
- ▶ UT24C
- ▶ UT24CP

**Table 869: Input Ports**

| Name      | Range | Description              |
|-----------|-------|--------------------------|
| WDTRELOAD | 1     | Reload signal            |
| WDT_CLK   | 1     | Clock source             |
| WDT_RST   | 1     | Synchronous Reset signal |

**Table 870: Parameters**

| Name     | Values                                        | Description   |

# DSP Inference Guide

The following are examples of DSP Inference.

```
// Multiply without register example, corresponding to the
// following parameter settings of MAC16 (for iCE40UP primitive
// only):
```

```
//      A_REG = "0b0"
//      B_REG = "0b0"
//      TOP_8x8_MULT_REG = "0b0"
//      BOT_8x8_MULT_REG = "0b0"
//      PIPELINE_16x16_MULT_REG1 = "0b0"
//      PIPELINE_16x16_MULT_REG0 = "0b0"
//      TOPOUTPUT_SELECT = "0b10"
//      BOTOUTPUT_SELECT = "0b10"
```

```
module mult_unsign_7_6(a,b,c);
    parameter A_WIDTH = 7;
    parameter B_WIDTH = 6;

    input unsigned [(A_WIDTH - 1):0] a;
    input unsigned [(B_WIDTH - 1):0] b;
    output unsigned [(A_WIDTH + B_WIDTH - 1):0] c;

    assign c = a * b;
endmodule
```

```
// Multiply/add without register example, corresponding to the
// following parameter settings of
```

```
// MAC16:
//      A_REG = "0b0"
//      B_REG = "0b0"
//      TOP_8x8_MULT_REG = "0b0"
//      BOT_8x8_MULT_REG = "0b0"
//      PIPELINE_16x16_MULT_REG1 = "0b0"
//      PIPELINE_16x16_MULT_REG0 = "0b0"
//      TOPOUTPUT_SELECT = "0b00"
//      BOTOUTPUT_SELECT = "0b00"
//      TOPADDSUB_LOWERINPUT = "0b01"
//      BOTADDSUB_LOWERINPUT = "0b01"
module multaddsub_add_unsign_7_6(a,b,c,din);
    parameter A_WIDTH = 7;
    parameter B_WIDTH = 6;

    input unsigned [(A_WIDTH - 1):0] a;
    input unsigned [(B_WIDTH - 1):0] b;
    input unsigned [(A_WIDTH + B_WIDTH - 1):0] din;
    output unsigned [(A_WIDTH + B_WIDTH - 1):0] c;
```

```
    assign c = a * b + din;
endmodule
```

```
// Mult/sub with input registers, corresponding to the
// following parameter settings of MAC16:
```

```
//      A_REG = "0b1"
//      B_REG = "0b1"
//      TOP_8x8_MULT_REG = "0b0"
//      BOT_8x8_MULT_REG = "0b0"
```

---

```

//      PIPELINE_16x16_MULT_REG1 = "0b0"
//      PIPELINE_16x16_MULT_REG0 = "0b0"
//      TOPOUTPUT_SELECT = "0b00"
//      BOTOUTPUT_SELECT = "0b00"
//      TOPADDSUB_LOWERINPUT = "0b01"
//      BOTADDSUB_LOWERINPUT = "0b01"

## Command Line Reference Guide

This help guide contains information necessary for running the core design flow development from the command line. For tools that appear in the Radiant software graphical user interface, use Tcl commands to perform commands that are described in the [Tcl Command Reference Guide](#).

### Command Line Program Overview

Lattice FPGA command line programs can be referred to as the FPGA flow core tools. These are tools necessary to run a complete design flow and are used for tasks such as module generation, design implementation, design verification, and design configuration. This topic provides an overview of those tools, their functions, and provides links to detailed usage information on each tool.

Each command line program provides multiple options for specifying device information, applying special functions using switches, designating desired output file names, and [using command files](#). The programs also have particular default behavior that often precludes the need for some syntax, making commands less complex. See [Command Line General Guidelines](#) and [Command Line Syntax Conventions](#).

To learn more about the applications, usage, and syntax for each command line program, click on the hyperlink of the command line name in the section below.

### Note

Many of the command line programs described in this topic are run in the background when using the tools you run in the Radiant software environment. Please also note that in some cases, command line tools described here are used for earlier FPGA architectures only, are not always recommended for command line use, or are only available from the command line.

**Design Implementation Using Command Line Tools** The table below lists all of the command line tools used for various design functions and their graphical user interface counterparts. The table also provides the functional description of each command line tool.

**Table 1: The Radiant Software Core Design and Tool Chart**

| Design Function                                | Command Line Tool          | Radiant Process                                                                               | Description                                                                                                                   |

## Command Line Data Flow

The following chart illustrates the FPGA command line tool data flow through a typical design cycle.

### Command Line Tool Data Flow

**See Also**

## Command Line General Guidelines

You can run the FPGA family Radiant software design tools from the command line. The following are general guidelines that apply.

- ▶ Files are position-dependent. Generally, they follow the convention [options] <infile> <outfile> (although order of <outfile> and <infile> are sometimes reversed). Use the **-h** command line option to check the exact syntax; for example, **par -h**.
- ▶ For any Radiant software FPGA command line program, you can invoke help on available options with the **-h** or **-help** command. See [Invoking Core Tool Command Line Programs](#) for more information
- ▶ Command line options are entered on the command line in any order, preceded by a hyphen (-), and separated by spaces.
- ▶ Most command line options are case-sensitive and must be entered in lowercase letters. When an option requires an additional parameter, the option and the parameter must be separated by spaces or tabs (i.e., **-l 5** is correct, **-l5** is not).
- ▶ Options can appear anywhere on the command line. Arguments that are bound to a particular option must appear after the option (i.e., **-f <command\_file>** is legal; **<command\_file> -f** is not).
- ▶ For options that may be specified multiple times, in most cases the option letter must precede each parameter. For example, **-b romeo juliet** is not acceptable, while **-b romeo -b juliet** is acceptable.
- ▶ If you enter the FPGA family Radiant software application name on the command line with no arguments and the application requires one or more arguments (**par**, for example), you get a brief usage message consisting of the command line format string.

- ▶ For any Radiant software FPGA command line program, you can store program commands in a command file. Execute an entire batch of arguments by entering the program name, followed by the **-f** option, and the command file name. This is useful if you frequently execute the same arguments each time you execute a program or to avoid typing lengthy command line arguments. See [Using Command Files](#).

## Command Line Syntax Conventions

The following conventions are used when commands are described:

**Table 2: Command Line Syntax Conventions**

| Convention       | Meaning                                                                                                                                                                                                                                                                                                                                   |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ( )              | Encloses a logical grouping for a choice between sub-formats.                                                                                                                                                                                                                                                                             |
| [ ]              | Encloses items that are optional. (Do not type the brackets.) Note that <infile[.udb]> indicates that the .udb extension is optional but that the extension must be UDB.                                                                                                                                                                  |
| { }              | Encloses items that may be repeated zero or more times.                                                                                                                                                                                                                                                                                   |
|                  | Logical OR function. You must choose one or a number of options. For example, if the command syntax says <b>pan up   down   right   left</b> you enter <b>pan up</b> or <b>pan down</b> or <b>pan right</b> or <b>pan left</b> .                                                                                                          |
| < >              | Encloses a variable name or number for which you must substitute information.                                                                                                                                                                                                                                                             |
| , (comma)        | Indicates a range for an integer variable.                                                                                                                                                                                                                                                                                                |
| - (dash)         | Indicates the start of an option name.                                                                                                                                                                                                                                                                                                    |
| :                | The bind operator. Binds a variable name to a range.                                                                                                                                                                                                                                                                                      |
| <b>bold text</b> | Indicates text to be taken literally. You type this text exactly as shown (for example, "Type <b>autoroute -all -i 5</b> in the command area.") Bold text is also used to indicate the name of an EPIC command, a Linux command, or a DOS command (for example, "The <b>playback</b> command is used to execute the macro you created."). |

**Table 2: Command Line Syntax Conventions**

| Convention                                        | Meaning                                                                                                                                                                                                                                              |
|---------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Italic text or text enclosed in angle brackets <> | Indicates text that is not to be taken literally. You must substitute information for the enclosed text. Italic text is also used to show a file directory path, for example, "the file is in the /cd/data/Radiant directory").                      |
| Monospace                                         | Indicates text that appears on the screen (for example, "File already exists.") and text from Linux or DOS text files. Monospace text is also used for the names of documents, files, and file extensions (for example, "Edit the autoexec.bat file" |

## Setting Up the Environment to Run Command Line

**For Windows** The environments for both the Radiant Tcl Console window or Radiant Standalone Tcl Console window (radiant.exe) are already set. You can start entering Tcl tool command or core tool commands in the console and the software will perform them.

When running the Radiant software from the Windows command line (via cmd.exe), you will need to add the following values to the following environment variables:

- ▶ PATH includes, for 64-bit

```
<Install_directory>\bin\nt64;<Install_directory>\ispfpga\bin\nt64
```

Example <Install\_directory>:

```
c:\lsc\radiant\1.0\bin\nt64;c:\lsc\radiant\1.0\ispfpga\bin\nt64
```

- ▶ FOUNDRY includes

```
set FOUNDRY= <Install_directory>\ispfpga
```

**For Linux** On Linux, the Radiant software provides a similar standalone Tcl Console window (radiantc) that sets the environment. The user can enter Tcl commands and core tool commands in it.

If you do not use the Tcl Console window, you need to run "bash" to switch to BASH" first, then run the following command.

► For BASH (64-bit):

```
export bindir=<Install_directory>/bin/lin64
source $bindir/radiant_env
```

After setting up for either Windows or PC, you can run the Radiant software executable files directly. For example, you can invoke the Place and Route program by:

```
par test_map.ldb test_par.ldb
```

**Note:**

---

For Programmer use `set PATH= C:/lsc/radiant/2024.2/programmer/bin/nt64.`

## Invoking Core Tool Command Line Programs

This topic provides general guidance for running the Radiant software FPGA flow core tools. Refer to [Command Line Program Overview](#) to see what these tools include and for further information.

For any the Radiant software FPGA command line programs, you begin by entering the name of the command line program followed by valid options for the program separated by spaces. Options include switches (**-f**, **-p**, **-o**, etc.), values for those switches, and file names, which are either input or output files. You start command line programs by entering a command in the Linux™ or DOS™ command line. You can also run command line scripts or command files.

See Table 2 on page 1672 for details and links to specific information on usage and syntax. You will find all of the usage information on the command line in the **Running FPGA Tools from the Command Line > Command Line Tool Usage** book topics.

**See Also**

▶ [Using Command Files](#)

## Invoking Core Tool Command Line Tool Help

To get a brief usage message plus a verbose message that explains each of the options and arguments, enter the FPGA family Radiant software application name on the command line followed by **-help** or **-h**. For example, enter **bitgen -h** for option descriptions for the **bitgen** program.

To redirect this message to a file (to read later or to print out), enter this command:

```
command_name -help | -h > filename
```

The usage message is redirected to the filename that you specify.

For those FPGA family Radiant software applications that have architecture-specific command lines (e.g., iCE40 UltraPlus), you must enter the application name, **-help** (or **-h**), and the architecture to get the verbose usage message specific to that architecture. If you fail to specify the architecture, you get a message similar to the following:

Use '**<apiname> -help <architecture>**' to get detailed usage for a particular architecture.

## Command Line Tool Usage

This section contains usage information of all of the command line tools and valid syntax descriptions for each.

Topics include:

- ▶ [Running cmpl\\_libs.tcl from the Command Line](#)
- ▶ [Running HDL Encryption from the Command Line](#)
- ▶ [Running Synthesis from the Command Line](#)
- ▶ [Running Postsyn from the Command Line](#)

- ▶ [Running MAP from the Command Line](#)
- ▶ [Running PAR from the Command Line](#)
- ▶ [Running Timing from the Command Line](#)
- ▶ [Running Backannotation from the Command Line](#)
- ▶ [Running Bit Generation from the Command Line](#)
- ▶ [Running Various Utilities from the Command Line](#)
- ▶ [Using Command Files](#)
- ▶ [Using Command Line Shell Scripts](#)

## Running `cmpl_libs.tcl` from the Command Line

The `cmpl_libs.tcl` command allows you to perform simulation library compilation from the command line.

The following information is for running `cmpl_libs.tcl` from the command line using the `tclsh` application. The supported Tcl version is 8.5 or higher.

If you do not have Tcl installed, or you have an older version, perform the following:

- ▶ Add `<Radiant_install_path>/tcltk/windows/BIN` to the front of your `PATH`, and
- ▶ For Linux users only, add `<Radiant_install_path>/tcltk/linux/bin` to the front of your `LD_LIBRARY_PATH`

### Note

---

The default version of Tcl on Linux could be older and may cause the script to fail. Ensure that you have Tcl version 8.5 or higher.

---

To check Tcl version, type:

```
tclsh
% info tclversion
% exit
```

For script usage, type:

```
tclsh cmpl_libs.tcl [-h|-help]
```

## Notes

- ▶ If Siemens Questa is already in your PATH and preceding any tools, you can use: `'-sim_path .'` for simplification; `'.'` will be added to the front of your PATH.
- ▶ Ensure the `FOUNDRY` environment variable is set. If the `FOUNDRY` environment variable is missing, then you need to set it before running the script. For details, refer to [Setting Up the Environment to Run Command Line](#).
- ▶ To execute this script error free, **Siemens Questa 2020.4** or a later version should be used for compilation.

Check log files under `<target_path>` (default = `.`) for any errors, as follows:

- ▶ For Windows, type:
 

```
find /i "error" *.log
```
- ▶ For Linux, type:
 

```
grep -i error *.log
```

Subjects included in this topic:

- ▶ [Running compl\\_lib.tcl](#)
- ▶ [Command Line Syntax](#)
- ▶ [compl\\_libs.tcl Options](#)
- ▶ [Example](#)

## Running compl\_lib.tcl

`compl_libs.tcl` allows you to compile simulation libraries from the command line.

## Command Line Syntax

```
tclsh <Radiant_install_path>/cae_library/simulation/scripts/compl_libs.tcl -
sim_path <sim_path> [-sim_vendor {mentor<default>|cadence}] [-device
{ice40up|lifel|lfcpx|lfd2nx|lfxo5-25|lfxo5-15d|lfxo5-100t|lfxo5-
55t|lavat|ut24c|ut24cp|all<default>}] [-target_path <target_path>]
```

## compl\_libs.tcl Options

The table below contains all valid options for `cmpl_libs.tcl`.

**Table 3: `cmpl_libs.tcl` Command Line Options**

| Option                                                                                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-sim_path &lt;sim_path&gt;</code>                                                                                                   | The <code>-sim_path</code> argument specifies the path to the simulation tool executable (binary) folder. This option is mandatory. Currently, only QuestaSim simulators from Mentor and Xcelium simulator from Cadence are supported. NOTE: If <code>&lt;sim_path&gt;</code> has spaces, then it must be surrounded by " ". Do not use { }.                                                                                                                                                                                                                                              |
| <code>[-sim_vendor {mentor&lt;default&gt; cadence}]</code>                                                                                | The <code>-sim_vendor</code> argument specifies simulation vendor. This argument is optional. If you do not use this argument, Mentor is chosen by default, and the libraries are compiled for QuestaSim. If you are using QuestaSim choose mentor, and Xcelium choose cadence for <code>-sim_vendor</code> .                                                                                                                                                                                                                                                                             |
| <code>[-device {ice40up lifcl lfcpx lfd2nx lfrmxo5-25 lfrmxo5-15d lfrmxo5-100t lfrmxo5-55t lavat ut24c ut24cp all&lt;default&gt;}]</code> | The <code>-device</code> argument specifies the Lattice FPGA device to compile simulation libraries for. This argument is optional, and the default is to compile libraries for all the Lattice FPGA devices.                                                                                                                                                                                                                                                                                                                                                                             |
| <code>[-target_path &lt;target_path&gt;]</code>                                                                                           | <p>The <code>-target_path</code> argument specifies the target path, where you want the compiled libraries and <code>modelsim.ini</code> file to be located. This argument is optional, and the default target path is the current folder.</p> <p><b>Note:</b></p> <ol style="list-style-type: none"> <li>1. This argument is recommended if the current folder is the Radiant software's startup (binary) folder, or if the current folder is write-protected.</li> <li>2. If <code>&lt;target_path&gt;</code> has spaces, then it must be surrounded by " ". Do not use { }.</li> </ol> |

### Example

This section illustrates and describes an example of a Simulation Libraries Compilation Tcl command.

The following command will compile all the Lattice FPGA libraries for Verilog simulation and place them under the folder specified by `-target_path`. The path to QuestaSim is specified by `-sim_path`.

```
tclsh <c:/lsc/radiant/1.0/>/cae_library/simulation/scripts/
cmpl_libs.tcl -sim_path C:/questasim64_10.4e/win64 -target_path
c:/mti_libs
```

# Running HDL Encryption from the Command Line

Radiant software allows you to encrypt the individual HDL source files.

The tool supports encryption of Verilog HDL and VHDL files. Per command's execution, single source file is encrypted.

The HDL file can be partially or fully encrypted depending on pragmas' placements within the HDL file. To learn more about pragmas' placements, see [Defining Pragmas](#).

Subjects included in this topic:

- ▶ [Command Line Syntax](#)
- ▶ [Encryption Options](#)
- ▶ [Examples](#)

## Running HDL Encryption

Before running the utility, you need to annotate the HDL file with the appropriate pragmas. Additionally, you may need to create a key file containing an encryption key. To view the key file's proper formatting, see [Key File](#).

## Command Line Syntax

```
encrypt_hdl [-k <keyfile>] [-l language]  
[-o <output_file>] [-comment <comment>] <input_HDL_file>
```

## Encryption Options

The table below contains descriptions of all valid options for HDL encryption.

**Table 4: Encryption Command Line Options**

| Option                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>-h(elp)</b>                            | Print command help message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>-k &lt;keyfile&gt;</b>                 | <p>A key repository file. Depending on the location of the key, this option is required or optional.</p> <ul style="list-style-type: none"> <li>▶ If the HDL source file contains no pragma, the key file is required. The tool encrypts the entire HDL file using all key sets declared in the key file.</li> <li>▶ If the HDL source file contains only <code>begin</code> and <code>end</code> pragmas and no key pragmas, the key file is required. The tool encrypts the section between <code>begin</code> and <code>end</code> using all key sets declared in the key file.</li> <li>▶ If the HDL source file contains the proper key pragma, <code>key_keyowner</code>, <code>key_keyname</code>, but the key file is missing the provided <code>key_public_key</code>, the tool fetches the first public key string matching the <code>key_keyowner</code> and <code>key_keyname</code> requirement in the key file</li> </ul> <p>If the HDL source file contains the proper definition of key, this option is not required.</p> <p>NOTE: If the same key name is defined in both, HDL source file and key.txt file, the key defined in HDL source file has a precedence.</p> |
| <b>-l &lt;language&gt;</b>                | Directive language, vhdl or verilog (default).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>-o &lt;output_file&gt;</b>             | An encrypted HDL file. This is an optional field. If not defined during the encryption, the tool generates a new output file <code>&lt;input_file_name&gt;_enc.v</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>&lt;input&gt;</b>                      | Input Verilog or VHDL file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>-comment</b><br><b>&lt;comment&gt;</b> | Additional comment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Examples

This section illustrates and describes a few examples of HDL encryption using Tcl commands.

### Example 1

This example shows a successful encryption of HDL file with default options. It is assumed that key is properly defined in HDL file. Since output file name was not specified, the tool generates an output file `<file_name>_enc.v` in the same directory as the location of the input file.

```
> encrypt_hdl -k source/impl_1/keys.txt -o top.v top.v
Options:
  Key repository file:      source/impl_1/keys.txt
  Directive language:      <not specified>, use verilog as default
  Output file: top.v
Processed 2 envelopes.
```

### Example 2

This example shows a successful encryption of HDL file by generating a new output file.

```
> encrypt_hdl -k source/impl_1/keys.txt -o remote_files/top_v1_en.v remote_files/sources/top_v1_part.v
Options:
  Key repository file:    source/impl_1/keys.txt
  Directive language:    <not specified>, use verilog as default
  Output file:           remote_files/top_v1_en.v
Processed 2 envelopes.
```

### Example 3

This example shows unsuccessful HDL encryption due to a missing key file. To correct this issue, the user must either define the appropriate key file key.txt or annotate the HDL file with appropriate pragmas. To correct the issue, define the key either in key.txt file or directly in HDL source file.

```
> encrypt_hdl -o remote_files/sources/top_v1_part_en.v remote_files/sources/top_v1_part.v
Options:
  Key repository file:    <not specified>
  Directive language:    <not specified>, use verilog as default
  Output file:           remote_files/sources/top_v1_part_en.v
ERROR - remote_files/sources/top_v1_part.v at line 88: missing key.
```

### Note

A key is always required in the encryption tool while key file is optional. If the complete key: key\_keyowner, key\_keyname, key\_method, and key\_public\_key, is defined within HDL source file, key file is not required.

For specific steps and information on how to encrypt HDL files in the Radiant software, refer to the following section in the Radiant Software Help: **User Guides > Securing the Design**.

## Defining Pragmas

Pragmas are used to specify the portion of the HDL source file that must be encrypted. Pragma' definition is compliant with IEEE 1735-2014 V1 standard.

Pragma syntax in Verilog HDL file:

```
`pragma protect <pragma's option>
```

Pragma syntax in VHDL file:

```
`protect <pragma's option>
```

**Table 5: List of Available Pragma Options**

| Name        | Available Values | Description                                                |
|-------------|------------------|------------------------------------------------------------|
| version     | 1 (default)      | Specifies the current Radiant software encryption version. |
| author      | string           | Specifies the file creator.                                |
| author_info | string           | Additional information you would like to include in file.  |
| encoding    | base64           | The output format of processed data.                       |
| begin       |                  | The start point for data obfuscation.                      |

**Table 5: List of Available Pragma Options**

| Name           | Available Values                   | Description                                           |
|----------------|------------------------------------|-------------------------------------------------------|
| end            |                                    | The end point for data obfuscation.                   |
| key_keyowner   | string                             | The key creator.                                      |
| key_keyname    | string                             | The RSA key name to specify the private key.          |
| key_method     | rsa                                | The cryptographic algorithm used for key obfuscation. |
| key_public_key |                                    | The RSA public key file name.                         |
| data_method    | aes128-cbc<br>aes256-cbc (default) | The AES encryption data method.                       |

To encrypt HDL source file, encryption version, encoding type, and key specific pragmas must be defined in the HDL source file by HDL designer; only the content within the pragmas is encrypted.

### Note

Multiple key sets can be declared in a single key file.

### Example of Verilog source file marked with Pragmas:

```
// 3 bit counter with asynchronous reset
module count(c,clk,rst);

input clk,rst;
output [2:0]c;
reg [2:0]c;

`pragma protect version=1
`pragma protect author="<Your Name>"
`pragma protect author_info="<Your info>"
`pragma protect key_keyowner="Lattice Semiconductor"
`pragma protect key_keyname="LSCC_RADIANT_2"
`pragma protect key_method="rsa"
`pragma protect key_public_key
MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAEZKUUhbuB6vSsc70hQJ
iNAWJR5unW/OWp/LFI71eAl3s9bOYE201Kdxbai+ndIeo8xFt2btzetUzuR6Srvh
xR2Sj9BbW1QToo2u8JfzD3X7AmRv1wKRX8708DPo4LDHZMA3qh0kFDDWkp2Eausf
LzE2cVxgq7fy/bDhUeN8xKQCSKJ7aguG6k0I6ROoZz211jzDLUQzhm2qYF8SpU1o
tD8/uw53wLfSuhR3MBOB++xcn2imvSLqdgHWuhX6CtZIx5CD4y8inCboLy/0Qrf6
sdTN5SAg2OZhjeNdzmqSWqhL2JTDw+Ou2fWzhEd0i/HN0y4NMr6h9fNn8nqxRyE7
IwIDAQAB

//put a blank line above
`pragma protect data_method="aes256-cbc"

`pragma protect begin
always @(posedge clk or posedge rst)
begin
if (rst)
c = 3'b000;
else
c = c + 1;
end
`pragma protect end

endmodule
```

The encrypted file may contain multiple encrypted key sets.

**Example of encrypted Verilog file:**

```
// 3 bit counter with asynchronous reset
module count(c,clk,rst);

input clk,rst;
output [2:0]c;
reg [2:0]c;

//put a blank line above

`pragma protect begin_protected
`pragma protect version=1
`pragma protect author="<Your Name>"
`pragma protect author_info="<Your info>"
`pragma protect encrypt_agent="Radiant encrypt_hdl"
`pragma protect encrypt_agent_info="Radiant encrypt_hdl Version 1.0"

`pragma protect encoding=(enctype="base64", line_length=64, bytes=256)
`pragma protect key_keyowner="Lattice Semiconductor"

- ▶ [Key File](#)

**Key File**

The key repository file defines the cryptographic public key used for RSA encryption. In Radiant software, the key file contains Lattice public key. Additionally, it may contain some of the common EDA vendors public keys.

The Lattice public key file key.txt is located at *<Radiant\_installed\_directory>/ispfpga/data/* folder. Aside from the Lattice Public Key, the current version contains the public key for Synopsys and Cadence.

### Note

If using Synplify Pro synthesis tool, both, the Lattice Public Key and the Synplify Pro Public Key must be defined in the key file. The Synplify Pro Public Key is used during the synthesis step to decrypt an encrypted design. The Lattice Public Key is used during the post-synthesis flow to decrypt an encrypted design.

A key file must contain properly declared pragmas such as `key_keyowner`, `key_keyname`, `key_method`, and `key_public_key` for each of the specified keys. The key value follows the `key_public_key` pragma.

The key file typically also contains the `data_method` pragma. It defines the algorithm used in data block encryption of HDL source file.

### Example of a Key File:

```
// Use Verilog pragma syntax in this file
`pragma protect version=1
`pragma protect author="<Your Name>"
`pragma protect author_info="<Your info>"
`pragma protect key_keyowner="Lattice Semiconductor"
`pragma protect key_keyname="LSCC_RADIAN2"
`pragma protect key_method="rsa"
`pragma protect key_public_key

## Running Synthesis from the Command Line

The Lattice Synthesis command tool allows you to synthesize Verilog and VHDL HDL source files into netlists for design entry into the Radiant software environment. Based on your strategy settings you specify in the Radiant software, a synthesis project (.synproj) file is created and then used by synthesis using the -f option. The Radiant software translates strategy options into command line options described in this topic.

Verilog source files are passed to the program using the **-ver** option and VHDL source files are passed using the **-vhd** option. For mixed language designs the language type is automatically determined by synthesis based on the top module of the design. For IP design, you must also specify IP location (**-ip\_dir**), IP core name (**-corename**), and encrypted RTL file name (**-ertl\_file**).

Subjects included in this topic:

- ▶ [Running Synthesis](#)
- ▶ [Command Line Syntax](#)
- ▶ [Synthesis Options](#)
- ▶ [Examples](#)

**Running Synthesis** Synthesis will convert your input netlist (.v) file into a structural Verilog file that is used for the remaining mapping process.

- ▶ To run synthesis, type **synthesis** on the command line with valid options. A sample of a typical synthesis command would be as follows:

There are many command line options that give you control over the way synthesis processes the output file. Please refer to the rest of the subjects in this topic for more details. See examples.

**Command Line Syntax** **synthesis** [-a <arch>] [-p <device>] [-sp <performance\_grade>] [-t <package\_name>] [{-path <searchpath>}] [-top <top\_module\_name>] [-ver {<verilog\_file.v>}] [-sver {systemverilog\_file.sv}] [-lib <libname>] [-vhd {<vhdl\_file.vhd/vhdl>}] [-udb <udb\_file.udb>] [-hdl\_param <param\_name param\_value >] [-vh2008] [-optimization\_goal <area | timing | balanced (default)>] [-force\_gsr <no (default) | yes>] [-ramstyle <auto (default) | distributed | block\_ram(EBR) | registers>] [-romstyle <auto(default) | logic | EBR>] [-output\_edif <filename.edf>] [-output\_hdl <filename.v>] [-sdc <sdc\_file.ldc>] [-logfile <synthesis\_logfile>] [-frequency <target\_frequency (default 200.0MHz (ICE40))>] [-max\_fanout <max\_fanout (default 1000)>] [-bram\_utilization <bram\_utilization (default 100%)>] [-use\_dsp <0|1(default)>] [-dsp\_utilization <dsp\_utilization (default 100%)>] [-mux\_style <auto(default) | pfu\_mux | L6Mux\_single | L6Mux\_multiple>] [-fsm\_encoding\_style <auto(default) | one-hot | gray | binary>] [-partition] [-partition\_reset] [-resolve\_mixed\_drivers <0(default)|1>] [-fix\_gated\_clocks <0|1(default)>] [-use\_carry\_chain <0|1(default)>] [-carry\_chain\_length <chain\_length>] [-use\_io\_insertion <0|1(default)>] [-use\_io\_reg <0|1|auto(default)>] [-resource\_sharing <0|1(default)>] [-propagate\_constants <0|1(default)>] [-remove\_duplicate\_regs <0|1(default)>] [-loop\_limit <max\_loop\_iter\_cnt (default 1950)>] [-twr\_paths <timing\_path\_cnt>] [-dt] [-comp] [-syn] [-ifd] [-f <project\_file\_name>] [-drc] [-drc\_off {<message\_id>}] [-drc\_cfg <rule> <value>]

## Synthesis Options

The table below contains descriptions of all valid options for synthesis.

**Table 6: Synthesis Command Line Options**

| Option                                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-a</b> <arch>                                       | Sets the FPGA architecture. This synthesis option must be specified and if the value is set to any unsupported FPGA device architecture the command will fail.                                                                                                                                                                                                                                                                                                                               |
| <b>-p</b> <device>                                     | Specifies the device type for the architecture (optional).                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>-sp</b> <performance_grade>                         | Sets the device performance speed grade. If no performance grade specified, default performance value is used.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>-f</b> <proj_file_name>                             | Specifies the synthesis project file name (.synproj). The project file can be edited by the user to contain all desired command line options.                                                                                                                                                                                                                                                                                                                                                |
| <b>-t</b> <package_name>                               | Specifies the package type of the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>-path</b> <searchpath>                              | Add searchpath for Verilog "include" files (optional).                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>-top</b> <top_module_name>                          | Name of top module (optional, but better to have to avoid ambiguity).                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>-lib</b> <lib_name>                                 | Name of VHDL library (optional).                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>-vhd</b> <vhd_file.vhd/vhdl>                        | Names of VHDL design files (must have, if language is VHDL or mixed language).                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>-ver</b> <verilog_file.v>                           | Names of Verilog design files (must have, if language is Verilog, or mixed language).                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>-sver</b><br><systemverilog_file.sv>                | Names of SystemVerilog design files (must have, if language is SystemVerilog or mixed language).                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>-hdl_param</b><br><param_name<br>param_value>       | Allows you to override HDL parameter pairs in the design file.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>-optimization_goal</b> <area<br>  timing (default)> | <p>The synthesis tool allows you to choose among the following optimization options:</p> <ul style="list-style-type: none"> <li>▶ <b>balanced</b> balances the levels of logic.</li> <li>▶ <b>area</b> optimizes the design for area by reducing the total amount of logic used for design implementation.</li> <li>▶ <b>timing</b> optimizes the design for timing.</li> </ul> <p>The default setting depends on the device type. Smaller devices, such as ice40tp default to balanced.</p> |
| <b>-force_gsr</b> <no(default)  <br>yes>               | Enables ( <b>yes</b> ) or disables ( <b>no</b> ) forced use of the global set/reset routing resources. When the value is auto, the synthesis tool decides whether to use the global set/reset resources.                                                                                                                                                                                                                                                                                     |

**Table 6: Synthesis Command Line Options**

| Option                                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-ramstyle</b> <auto(default)   distributed   block_ram(EBR)   registers> | <p>Sets the type of random access memory globally to <i>distributed</i>, <i>embedded block RAM</i>, or <i>registers</i>. The default is auto which attempts to determine the best implementation, that is, synthesis tool will map to technology RAM resources (EBR/Distributed) based on the resource availability.</p> <p>This option will apply a syn_ramstyle attribute globally in the source to a module or to a RAM instance. To turn off RAM inference, set its value to registers.</p> <ul style="list-style-type: none"> <li>▶ <b>registers</b> causes an inferred RAM to be mapped to registers (flip-flops and logic) rather than the technology-specific RAM resources.</li> <li>▶ <b>distributed</b> causes the RAM to be implemented using the distributed RAM or PFU resources.</li> <li>▶ <b>block_ram (EBR)</b> causes the RAM to be implemented using the dedicated RAM resources. If your RAM resources are limited, for whatever reason, you can map additional RAMs to registers instead of the dedicated or distributed RAM resources using this attribute.</li> <li>▶ <b>no_rw_check</b> (Certain technologies only). You cannot specify this value alone. Without no_rw_check, the synthesis tool inserts bypass logic around the RAM to prevent the mismatch. If you know your design does not read and write to the same address simultaneously, use no_rw_check to eliminate bypass logic. Use this value only when you cannot simultaneously read and write to the same RAM location and you want to minimize overhead logic.</li> </ul> |

**Table 6: Synthesis Command Line Options**

| Option                                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-romstyle</b> <auto (default)   logic   EBR>                 | <p>Allows you to globally implement ROM architectures using <i>dedicated</i>, <i>distributed ROM</i>, or a <i>combination of the two</i> (auto). This applies the syn_romstyle attribute globally to the design by adding the attribute to the module or entity. You can also specify this attribute on a single module or ROM instance.</p> <p>Specifying a syn_romstyle attribute globally or on a module or ROM instance with a value of:</p> <ul style="list-style-type: none"> <li>▶ <b>auto</b> allows the synthesis tool to choose the best implementation to meet the design requirements for performance, size, etc.</li> <li>▶ <b>EBR</b> causes the ROM to be mapped to dedicated EBR block resources. ROM address or data should be registered to map it to an EBR block. If your ROM resources are limited, for whatever reason, you can map additional ROM to registers instead of the dedicated or distributed RAM resources using this attribute.</li> </ul> <p>Infer ROM architectures using a CASE statement in your code. For the synthesis tool to implement a ROM, at least half of the available addresses in the CASE statement must be assigned a value. For example, consider a ROM with six address bits (64 unique addresses). The case statement for this ROM must specify values for at least 32 of the available addresses.</p> |
| <b>-output_edif</b> <filename.edf>                              | Specifies the name of the output EDIF netlist file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>-output_hdl</b> <filename.v>                                 | Specifies the name of the output Verilog netlist file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>-sdc</b> <sdc_file.ldc>                                      | Specifies a Lattice design constraint (.ldc) file input.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>-loop_limit</b> <max_loop_iter_cnt (default 1950)>           | <p>Specifies the iteration limits for “for” and “while” loops in the user RTL for loops that have the loop index as a variable and not a constant.</p> <p>The higher the loop_limit, the longer the run time. Also, for some designs, a higher loop limit may cause stack overflow during some of the optimizations during compile/synthesis.</p> <p>The default value is 1950. Setting a higher value may cause stack overflow during some of the optimizations during synthesis.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>-logfile</b> <synthesis_logfile>                             | Specifies the name of the synthesis log file in ASCII format. If you do not specify a name, synthesis will output a file named synthesis.log by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>-frequency</b> <target_frequency (default 200.0MHz (ICE40))> | Specifies the target frequency setting. Default frequency value is 200.0 MHz.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>-max_fanout</b><br><max_fanout (default 1000)>                           | Specifies maximum global fanout limit to the entire design at the top level. Default value is 1000 fanouts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>-bram_utilization</b><br><bram_utilization (default 100%)>               | Specifies block RAM utilization target setting in percent of total vacant sites. Default is 100 percent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>-use_dsp</b> <0 1(default)>                                              | Specifies how DSP modules are implemented and allows DSP inference.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>-dsp_utilization</b><br><dsp_utilization (default 100%)>                 | Specifies the percentage of DSP that is allowed to be used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>-mux_style</b> <auto(default)   pfu_mux   L6Mux_single   L6Mux_multiple> | Specifies the MUX style setting, which controls the way the macrogenerator implements the multiplexer macros.<br><br>Valid options are <i>auto</i> , <i>L6Mux Multiple</i> , <i>L6Mux Single</i> , and <i>PFU Mux</i> . The default value is <i>auto</i> , meaning that the tool looks for the best implementation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>-fsm_encoding_style</b><br><auto(default)   one-hot   gray   binary>     | Specifies One-Hot, Gray, or Binary style. The -fsm_encoding_style. Allows the user to determine which style is faster based on specific design implementation.<br><br>Valid options are <i>auto</i> , <i>one-hot</i> , <i>gray</i> , and <i>binary</i> . The default value is <i>auto</i> , meaning that the tool looks for the best implementation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>-use_carry_chain</b><br><0 1(default)>                                   | Turns on (1) or off (0) carry chain implementation for adders. The 1 or true setting is the default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>-carry_chain_length</b><br><chain_length>                                | Specifies the maximum length of the carry chain.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>-use_io_insertion</b><br><0 1(default)>                                  | Specifies the use of I/O insertion. The 1 or true setting is the default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>-use_io_reg</b><br><0 1 auto(default)>                                   | Packs registers into I/O pad cells based on timing requirements for the target Lattice families. The value 1 enables and 0 disables (default) register packing. This applies it globally forcing the synthesis tool to pack all input, output, and I/O registers into I/O pad cells.<br><br>NOTE: You can place the syn_useioff attribute on an individual register or port. When applied to a register, the synthesis tool packs the register into the pad cell, and when applied to a port, packs all registers attached to the port into the pad cell.<br><br>The syn_useioff attribute can be set on a: <ul style="list-style-type: none"> <li>▶ top-level port</li> <li>▶ register driving the top-level port</li> <li>▶ lower-level port, only if the register is specified as part of the port declaration</li> </ul> |

**Table 6: Synthesis Command Line Options**

| Option                                           | Description                                                                                                                                                                                                                                                                                |
|--------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-resource_sharing</b><br><0 1(default)>       | Specifies the resource sharing option. The 1 or true setting is the default.                                                                                                                                                                                                               |
| <b>-propagate_constants</b><br><0 1(default)>    | Prevents sequential optimization such as constant propagation, inverter push-through, and FSM extraction. The 1 or true setting is the default.                                                                                                                                            |
| <b>-remove_duplicate_regs</b><br><0 1(default)>  | Specifies the removal of duplicate registers. The 1 or true setting is the default.                                                                                                                                                                                                        |
| <b>-twr_paths</b><br><timing_path_cnt>           | Specifies the number of critical paths.                                                                                                                                                                                                                                                    |
| <b>-dt</b>                                       | Disables the hardware evaluation capability. (This option is for internal use only.)                                                                                                                                                                                                       |
| <b>-comp</b>                                     | Indicates HDL compilation only without synthesis. (This option is for internal use only.)                                                                                                                                                                                                  |
| <b>-syn</b>                                      | Allows you to synthesize without HDL compilation. Reads the .db file. (This option is for internal use only.)                                                                                                                                                                              |
| <b>-udb</b> <udb_file.udb>                       | Writes UDB output.                                                                                                                                                                                                                                                                         |
| <b>-ifd</b>                                      | Sets option to dump intermediate files. If you run the tool with this option, it will dump about 20 intermediate encrypted Verilog files. If you supply Lattice with these files, they can be decrypted and analyzed for problems. This option is good to for analyzing simulation issues. |
| <b>-fix_gated_clocks</b><br><0 1(default)>       | Allows you to enable/disable gated clock optimization. By default, the option is enabled.                                                                                                                                                                                                  |
| <b>-vh2008</b>                                   | Enables VHDL 2008 support.                                                                                                                                                                                                                                                                 |
| <b>-drc</b>                                      | Run LSE RTL design rule checking.                                                                                                                                                                                                                                                          |
| <b>-drc_cfg</b> <rule>                           | Configure a DRC rule                                                                                                                                                                                                                                                                       |
| <b>-drc_off</b> <message_id>                     | Disable one or more DRC rules.                                                                                                                                                                                                                                                             |
| <b>-partition</b>                                | Enables the partition flow.                                                                                                                                                                                                                                                                |
| <b>-partition_reset</b>                          | Resets the partition flow (auto enables -partition).                                                                                                                                                                                                                                       |
| <b>-resolve_mixed_drivers</b><br><0 default   1> | Connects the net to the VCC or GND driver if it is driven by them.                                                                                                                                                                                                                         |

### Examples

The following are examples of synthesis command lines and their respective descriptions:

```
synthesis -a "ice40tp" -p itpa08 -t SG48 -sp "6" -mux_style Auto
```

```
-use_io_insertion 1
```

```
-sdc "C:/my_radiant_tutorial/impl1/impl1.ldc"
```

```
-path "C:/lsc/radiant/1.0/ispfpga/ice40tp/data" "C:/my_radiant_tutorial/impl1"
"C:/my_radiant_tutorial"
```

```
-ver "C:/my_radiant_tutorial/impl1/source/LED_control.v"
```

```
"C:/my_radiant_tutorial/impl1/source/spi_gpio.v"
```

```
"C:/my_radiant_tutorial/impl1/source/spi_gui_led_top.v"
```

```
-path "C:/my_radiant_tutorial"
```

```
-top spi_gui_led_top
```

```
-output_hdl "LEDtest_impl1.vm"
```

## Running Postsyn from the Command Line

The Postsyn process converts synthesized VM and integrates IPs into a completed design in UDB format for the remaining mapping process.

Subjects included in this topic:

► [Command Line Syntax](#)

► [Postsyn Options](#)

### Command Line Syntax

```
postsyn [-w] [-a <architecture>] [-p <device>] [-t <package>]
[-sp <performance>] [-oc <operating_condition>] [-ldc
<ldc_file>] [-iplist <iplist_file>] [-macro <macro_list_file>]
[-gui] [-msgset <msgtypefile>] [-verbose] [-o <output.udb>] [-
keeprtl] [-top] [-cont_on_sdc_err] <input.vm>
```

### Postsyn Options

**Table 7: Postsyn Command Line Options**

| Option  | Description                 |
|---------|-----------------------------|
| -h(elp) | Print command help message. |
| -w      | Overwrite output file.      |
| -a      | Target architecture name.   |
| -p      | Target device name.         |
| -t      | Target package name.        |

**Table 7: Postsyn Command Line Options**

| Option                  | Description                                                       |
|-------------------------|-------------------------------------------------------------------|
| <b>-sp</b>              | Target performance grade.                                         |
| <b>-oc</b>              | Target operating condition: commercial   industrial   automotive. |
| <b>-ldc</b>             | Load LDC file.                                                    |
| <b>-iplist</b>          | Load IP list file.                                                |
| <b>-macro</b>           | Load list file if any macro is used in the design.                |
| <b>-o</b>               | Output UDB file.                                                  |
| <b>-keeprtl</b>         | Keep RTL view if it exists in UDB file.                           |
| <b>-cont_on_sdc_err</b> | Continue on SDC error instead of exit.                            |
| <b>-verbose</b>         | Print more detailed messages.                                     |
| <b>-top</b>             | Indicate that the input is for the top design.                    |
| <b>&lt;input.vm&gt;</b> | Input structural Verilog file.                                    |

## Running MAP from the Command Line

The **Map Design** process in the Radiant software environment can also be run through the command line using the **map** program. The **map** program takes an input database (.udb) file and converts this design represented as a network of device-independent components (e.g., gates and flip-flops) into a network of device-specific components (e.g., PFUs, PFFs, and EBRs) or configurable logic blocks in the form of a Unified Database (.udb) file.

Subjects included in this topic:

- ▶ [Running MAP](#)
- ▶ [Command Line Syntax](#)
- ▶ [MAP Options](#)
- ▶ [Example](#)

### Running MAP

MAP uses the database (.udb) file that was the output of the **Synthesis** process and outputs a mapped Unified Database (.udb) file with constraints embedded.

- ▶ To run MAP, type **map** on the command line with, at minimum, the required options to describe your target technology (i.e., architecture, device, package, and performance grade), the input .udb along with the input .ldc file. The output .udb file specified by the **-o** option. That

additional physical constraint file (\*.pdc) can be applied optionally. A sample of a typical MAP command would be as follows:

```
map counter_impl1_syn.udb impl1.pdc -o counter_impl1.udb
```

### Note

The **-a** (architecture) option is not necessary when you supply the part number with the **-p** option. There is also no need to specify the constraint file here, but if you do, it must be specified after the input .udb file name. The constraint file automatically takes the name "**output**" in this case, which is the name given to the output .udb file. If the output file was not specified with the **-o** option as shown in the above case, **map** would place a file named input.udb into the current working directory, taking the name of the input file. If you specify the input.ldc file and it is not there, map will error out.

There are many command line options that give you control over the way MAP processes the output file. Please refer to the rest of the subjects in this topic for more details.

### Command Line Syntax

```
map [ -h <arch> ] <infile[.udb]> [<options>]
```

### MAP Options

The table below contains descriptions of all valid options for MAP.

**Table 8: MAP Command Line Options**

| Option                  | Description                                                                                  |
|-------------------------|----------------------------------------------------------------------------------------------|
| <b>-h</b> <arch>        | Displays all of the available MAP command options for mapping to the specified architecture. |
| <infile[.udb]>          | Specifies the output design file name in .udb format. The .udb extension is optional.        |
| <b>-help</b>            | Print usage.                                                                                 |
| <b>-inferGSR</b>        | GSR inferencing if applicable.                                                               |
| <b>-o</b> <name[.udb]>  | Optional output design file (.udb).                                                          |
| <b>-f</b>               | Reads map command line arguments and switches from file.                                     |
| <b>-mp</b> <name[.mrp]> | Optional report file (.mrp).                                                                 |
| <b>-xref_sig</b>        | Report signal cross reference for renamed signals.                                           |
| <b>-xref_sym</b>        | Report symbol cross reference for renamed symbols.                                           |
| <b>-hierprt</b>         | Print out hierarchical resource usage in .hrr file.                                          |
| <b>-cont_on_sdc_err</b> | Ignore Constraint errors.                                                                    |
| <b>-u</b>               | Unclip unused instances.                                                                     |

### Example

The following command maps an input database file named mapped.udb and outputs a mapped Unified Database file named mapped.udb.

```
map counter_impl1_syn.udb impl1.pdc -o counter_impl1.udb
```

## Running PAR from the Command Line

The **Place & Route Design** process in the Radiant software environment can also be run through the command line using the **par** program. The **par** program takes an input mapped Unified Database (.udb) file and further places and routes the design, assigning locations of physical components on the device and adding the inter-connectivity, outputting a placed and routed .udb file.

The Implementation Engine multi-tasking option available in Linux is explained in detail here because the option is not available for PCs.

Subjects included in this topic:

- ▶ [Running PAR](#)
- ▶ [Command Line Syntax](#)
- ▶ [General PAR Options](#)
- ▶ [Examples](#)
- ▶ [PAR Multi-Tasking \(-m\) Option](#)

### Running PAR

PAR uses your mapped Unified Database (.udb) file that were the outputs of the **Map Design** process or the **map** program. With these inputs, **par** outputs a new placed-and-routed .udb file, a PAR report (.par) file, and a PAD (specification (.pad) file that contains I/O placement information.

- ▶ To run PAR, type **par** on the command line with at minimum, the name of the input .udb file and the desired name of the output .udb file. Design constraints from previous stages are automatically embedded in the input .udb file, however the par program can accept additional constraints with either a .pdc or .sdc file. A sample of a basic PAR command would be as follows:

```
par input.udb output.udb
```

There are many command line options that give you control over PAR. Please refer to the rest of the subjects in this topic for more details.

## Command Line Syntax

```
par [-w] [-n <iterations:0,100>] [-t <iteration:0,100>] [-stopzero] [-s
<savecount:0,100>] [-m <nodelistfile>] [-cores <number of cores>] [-r] [-k] [-p
] [-x] [-pack <density:0,100>] [-sp <setupspeedgrade>] [-hsp
<holdspeedgrade>] [-dh] [-hos] [-sort <method>] <infile> <outfile> [<pdcfile>]
```

### Note

All filenames without special switches must be in the order <infile> <outfile> <pdcfile>. Options may exist in any order.

## General PAR Options

**Table 9: General PAR Command Line Options**

| Option           | Description                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-f</b>        | Read par command line arguments and switches from file.                                                                                                                                                                                                                                                                                                                                            |
| <b>-w</b>        | Overwrite. Allows overwrite of an existing file (including input file).                                                                                                                                                                                                                                                                                                                            |
| <b>-n</b>        | Number of iterations (seeds). Use "-n 0" to run until fully routed and a timing score of zero is achieved. Default: 1.                                                                                                                                                                                                                                                                             |
| <b>-t</b>        | Start at this placer cost table entry. Default is 1.                                                                                                                                                                                                                                                                                                                                               |
| <b>-stopzero</b> | Stop running iterations once a timing score of zero is achieved.                                                                                                                                                                                                                                                                                                                                   |
| <b>-s</b>        | Save "n" best results for this run. Default: Save All.                                                                                                                                                                                                                                                                                                                                             |
| <b>-m</b>        | Multi task par run. File "<node list file>", contains a list of node names to run the jobs on.                                                                                                                                                                                                                                                                                                     |
| <b>-cores</b>    | Run multiple threads on the local machine. You can specify "<number of cores>" to run the jobs. For cases when the user specifies both -cores and -m with a valid node list file, PAR should apply both settings (merge). If the user repeats the host machine in the node list file, the settings in the node list file take precedence over the setting in -cores (for backwards compatibility). |
| <b>-p</b>        | Do not run placement.                                                                                                                                                                                                                                                                                                                                                                              |
| <b>-r</b>        | Do not run router.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>-k</b>        | Keep existing routing in input UDB file.<br>Note: only meaningful when used with -p.                                                                                                                                                                                                                                                                                                               |
| <b>-x</b>        | Ignore timing constraints.                                                                                                                                                                                                                                                                                                                                                                         |

**Table 9: General PAR Command Line Options**

| Option       | Description                                                                                                                              |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-pack</b> | Set the packing density parameter.<br>Default: auto.                                                                                     |
| <b>-sp</b>   | Change performance grade for setup optimization.<br>Default: Keep current performance grade.                                             |
| <b>-hsp</b>  | Change performance grade for hold optimization.<br>Default: M.                                                                           |
| <b>-dh</b>   | Disable hold timing correction.                                                                                                          |
| <b>-hos</b>  | Prioritize hold timing correction over setup performance.                                                                                |
| <b>-sort</b> | Set the sorting method for ranking multiple iterations. <method> "c" sorts by cumulative slack, "w" sorts by worst slack.<br>Default: c. |
| <infile>     | Name of input UDB file.                                                                                                                  |
| <outfile>    | Name of output UDB file.                                                                                                                 |

**Table 10: PAR Placement Command Line Option**

| Option    | Description                                                                                                                                   |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <pdcfile> | Name of optional constraint file.<br><br>Note: the contents of <pdcfile> will overwrite all constraints saved in the input UDB file <infile>. |

### Examples

Following are a few examples of PAR command lines and a description of what each does.

#### Example 1

The following command places and routes the design in the file input.udb and writes the placed and routed design to output.udb.

```
par input.udb output.udb
```

#### Example 2

The following command runs 20 place and route iterations. The iterations begin at cost table entry 5. Only the best 3 output design files are saved.

```
par -n 20 -t 5 -s 3 input.udb output.udb
```

#### Example 3

(Lattice FPGAs only) This is an example of **par** using the **-io** switch to generate .udb files that contain only I/O for viewing in the PAD Specification file for adjustment of `Idc_set_location` constraints for optimal I/O placement. You can display I/O placement assignments in the Radiant Spreadsheet View and choosing **View > Display IO Placement**.

```
par -io -w lev1bist.udb lev1bist_io.udb
```

### PAR Multi-Tasking (-m) Option

This section provides information about environment setup, node list file creation, and step-by-step instructions for running the PAR Multi-tasking (**-m**) option from the command line. The PAR **-m** option allows you to use multiple machines (nodes) that are networked together for a multi-run PAR job, significantly reducing the total amount of time for completion. Before the multi-tasking option was developed, PAR could only run multiple jobs in a linear or serial fashion. The total time required to complete PAR was equal to the amount of time it took for each of the PAR jobs to run.

For example, the PAR command:

```
par -n 10 mydesign.udb output.udb
```

tells PAR to run 10 place and route passes (**-n 10**). It runs each of the 10 jobs consecutively, generating an output .udb file for each job, i.e., `output_par.dir/5_1.udb`, `output_par.dir/5_2.udb`, etc. If each job takes approximately one hour, then the run takes approximately 10 hours.

Suppose, however, that you have five nodes available. The PAR Multi-tasking option allows you to use all five nodes at the same time, dramatically reducing the time required for all ten jobs.

### To run the PAR multi-tasking option from the command line:

1. First generate a file containing a list of the node names, one per line as in the following example:

```
# This file contains a profile node listing for a PAR multi
# tasking job.
[machine1]
SYSTEM = linux
CORENUM = 2
[machine2]
SYSTEM = linux
CORENUM = 2
Env = /home/user/setup_multipar.lin
Workdir = /home/user/myworkdir
```

You must use the format above for the node list file and fill in all required parameters. Parameters are case insensitive. The node or machine names are given in square brackets on a single line.

The **System** parameter can take `linux` or `pc` values depending upon your platform. However, the `PC` value cannot be used with Linux because it is not possible to create a multiple computer farm with PCs. **Corenum** refers to the number of CPU cores available. Setting it to zero will disable the

node from being used. Setting it to a greater number than the actual number of CPUs will cause PAR to run jobs on the same CPU lengthening the runtime.

The **Env** parameter refers to a remote environment setup file to be executed before PAR is started on the remote machine. This is optional. If the remote machine is already configured with the proper environment, this line can be omitted. To test to see if the remote environment is responsive to PAR commands, run the following:

```
ssh <remote_machine> par <par_option>
```

See the [System Requirements](#) section below for details on this parameter.

**Workdir** is the absolute path to the physical working directory location on the remote machine where PAR should be run. This item is also optional. If an account automatically changes to the proper directory after login, this line can be omitted. To test the remote directory, run the following,

```
ssh <remote_machine> ls <udb_file>
```

If the design can be found then the current directory is already available.

2. Now run the job from the command line as follows:

```
par -m nodefile_name -n 10 mydesign.udb output.udb
```

This runs the following jobs on the nodes specified.

```
Starting job 5_1 on node NODE1 at ...
Starting job 5_2 on node NODE2 at ...
Starting job 5_3 on node NODE3 at ...
Starting job 5_4 on node NODE4 at ...
Starting job 5_5 on node NODE5 at ...
```

As the jobs finish, the remaining jobs start on the nodes until all 10 jobs are complete. Since each job takes approximately one hour, all 10 jobs will complete in approximately two hours.

### Note

If you attempt to use the multi-tasking option and you have specified only one placement iteration, PAR will disregard the **-m** option from the command and run the job in normal PAR mode. In this case you will see the following message:

```
WARNING - par: Multi task par not needed for this job. -m switch will be ignored.
```

**System Requirements** **ssh** must be located through the PATH variable. On Linux, the utility program's secure shell (**ssh**) and secure shell daemon (**sshd**) are used to spawn and listen for the job requests.

The executables required on the machines defined in the node list file are as follows:

- ▶ /bin/sh
- ▶ par (must be located through the PATH variable)

Required environment variable on local and remote machines are as follows:

- ▶ **FOUNDRY** (points at FOUNDRY directory structure must be a path accessible to both the machine from which the Implementation Engine is run and the node)
- ▶ **LM\_LICENSE\_FILE** (points to the security license server nodes)
- ▶ **LD\_LIBRARY\_PATH** (supports par path for shared libraries must be a path accessible to both the machine from which the Implementation Engine is run and the node)

To determine if everything is set up correctly, you can run the **ssh** command to the nodes to be used.

Type the following:

```
ssh <machine_name> /bin/sh -c par
```

If you get the usage message back on your screen, everything is set correctly. Note that depending upon your setup, this check may not work even though your status is fine.

If you have to set up your remote environment with the proper environment variables, you must create a remote shell environment setup file. An example of an ASCII file used to setup the remote shell environment would be as follows for ksh users:

```
export FOUNDRY=<install_directory>/ispfpga/bin/lin64
export PATH=$FOUNDRY/bin/lin64:$PATH
export LD_LIBRARY_PATH=$FOUNDRY/bin/lin:$LD_LIBRARY_PATH
64
```

For csh users, you would use the **setenv** command.

### Screen Output

When PAR is running multiple jobs and is not in multi-tasking mode, output from PAR is displayed on the screen as the jobs run. When PAR is running multiple jobs in multi-tasking mode, you only see information regarding the current status of the feature.

For example, when the job above is executed, the following screen output would be generated:

```
Starting job 5_1 on node NODE1
Starting job 5_2 on node NODE2
Starting job 5_3 on node NODE3
Starting job 5_4 on node NODE4
Starting job 5_5 on node NODE5
```

When one of the jobs finishes, this message will appear:

```
Finished job 5_3 on node NODE3
```

These messages continue until there are no jobs left to run.

## Running Timing from the Command Line

The **MAP Timing** and **Place & Route Timing** processes in the Radiant software environment can also be run through the command line using the **timing** program. Timing can be run on designs using the placed and routed Unified Design Database (.udb) and associated timing constraints specified in the design's (.ldc, .fdc, .sdc or .pdc) file or device constraints extracted from the design. Using these input files, **timing** provides static timing analysis and outputs a timing report file (.tw1/.twr).

Timing checks the delays in the Unified Design Database (.udb) file against your timing constraints. If delays are exceeded, Timing issues the appropriate timing error. See “Implementing the Design” in the Radiant Software Help and associated topics for more information.

Subjects included in this topic:

- ▶ [Running Timing](#)
- ▶ [Command Line Syntax](#)
- ▶ [Timing Options](#)
- ▶ [Examples](#)

### Running Timing

Timing uses your input mapped or placed-and-routed Unified Design Database (.udb) file and associated constraint file to create a Timing Report.

- ▶ To run Timing, type **timing** on the command line with, at minimum, the names of your input .udb and sdc files to output a timing report (.twr) file. A sample of a typical Timing command would be as follows:

```
timing design.udb (constraint is embedded in udb)
```

### Note

---

The above command automatically generates the report file named design.twr which is based on the name of the .udb file.

---

There are several command line options that give you control over the way Timing generates timing reports for analysis. Please refer to the rest of the subjects in this topic for more details. See Examples.

**Command Line Syntax** `timing <udb file name> [ -sdc <sdc file name> ] [ -hld | -sethld ] [ -o <output file name> ] [ -v <integer> ] [-endpoints <integer>] [-help]`

### Timing Options

The following tables contain descriptions of all valid options for Timing.

**Table 11: Compulsory Timing Command Line Options**

| Compulsory Option   | Description                |
|---------------------|----------------------------|
| <b>-db-file</b> arg | Design database file name. |

**Table 12: Optional Timing Command Line Options**

| Optional Option              | Description                                                          |
|------------------------------|----------------------------------------------------------------------|
| <b>-endpoints</b> arg (=10)  | Number of end points.                                                |
| <b>-logical-db-file</b> arg  | Logical design database file name.                                   |
| <b>-logical-sdc-file</b> arg | Alternate sdc file name.                                             |
| <b>-u</b> arg (=10)          | Number of unconstrained end points printed in the table.             |
| <b>-ports</b> arg (=10)      | Number of top ports printed in the table.                            |
| <b>-help</b>                 | Print the usage and exit.                                            |
| <b>-hld</b>                  | Hold report only.                                                    |
| <b>-sp</b> arg (=None)       | Setup speed grade.                                                   |
| <b>-hsp</b> arg (=M)         | Hold speed grade.                                                    |
| <b>-rpt-file</b> arg         | Timing report file name.                                             |
| <b>-o</b> arg                | Timing report file name.                                             |
| <b>-alt_report</b>           | Diamond-like report.                                                 |
| <b>-report_sdc</b>           | Parsed file appears in report file.                                  |
| <b>-sdc-file</b> arg         | sdc file name.                                                       |
| <b>-sethld</b>               | Both setup and hold report.                                          |
| <b>-v</b> arg (=10)          | Number of paths per constraint.                                      |
| <b>-time_through_async</b>   | Timer will time through async resets.                                |
| <b>-iotime</b>               | Compute the input setup/hold and clock to output delays of the FPGA. |
| <b>-io_allspeed</b>          | Get worst IO results for all speed grades.                           |
| <b>-pwrprd</b>               | Output clock information for PowerCalculator.                        |
| <b>-nperend</b> arg (=1)     | Number of paths per end point.                                       |
| <b>-html</b>                 | HTML format report.                                                  |

**Table 12: Optional Timing Command Line Options**

| Optional Option        | Description                                         |
|------------------------|-----------------------------------------------------|
| <b>-gui</b>            | Call from GUI.                                      |
| <b>-msg arg</b>        | Message log file.                                   |
| <b>-msgset arg</b>     | Message setting.                                    |
| <b>-io_allspeed</b>    | Get worst IO results for all speed grades.          |
| <b>-dump_cdc</b>       | Dump CDC registers.                                 |
| <b>-dump_uncovered</b> | Dump load pins of connections that are not covered. |

### Examples

Following are a few examples of Timing command lines and a description of what each does.

#### Example 1

The following command verifies the timing characteristics of the design named design1.ldb, generating a summary timing report. Timing constraints contained in the file group1.prj are the timing constraints for the design. This generates the report file design1.twr.

```
timing design1.ldb (constraint is embedded in ldb)
```

#### Example 2

The following command produces a file listing all delay characteristics for the design named design1.ldb. Timing constraints contained in the file group1.prj are the timing constraints for the design. The file output.twr is the name of the verbose report file.

```
timing -v design1.ldb -o output.twr
```

#### Example 3

The following command analyzes the file design1.ldb and reports on the three worst errors for each constraint embedded in design1.ldb and in additional timing constraint file (e.g. test.ldc). The report is called design1.twr.

```
timing -e 3 -sdc-file test.ldc design1.ldb
```

#### Example 4

The following command analyzes the file design1.ldb and produces a verbose report to check on hold times on any timing constraints embedded in design1.ldb. With the output report file name unspecified here, a file using the root name of the .ldb file (i.e., design1.twr) will be output by default.

```
timing -v -hld design1.ldb
```

### Example 5

The following command analyzes the file design1.udb and produces a summary timing report to check on both setup and hold times on any timing constraints embedded in design1.udb. With the output report file name unspecified here, a file using the root name of the .udb file (i.e., design1.twr) will be output by default.

```
timing -sethld design1.udb
```

## Running Backannotation from the Command Line

The **Generate Timing Simulation Files** process in the Radiant software environment can also be run through the command line using the **backanno** program. The **backanno** program back-annotates physical information (e.g., net delays) to the logical design and then writes out the back-annotated design in the desired netlist format. Input to **backanno** is a Unified Database file (.udb) a mapped and partially or fully placed and/or routed design.

Subjects included in this topic:

- ▶ [Running Backanno](#)
- ▶ [Command Line Syntax \(Verilog\)](#)
- ▶ [Backanno Options](#)
- ▶ [Examples](#)

### Running Backanno

Backanno uses your input mapped and at least partially placed-and-routed Unified Database (.udb) file to produce a back-annotated netlist (.v) and standard delay (.sdf) file. This tool supports all FPGA design architecture flows. Only Verilog netlist is generated.

- ▶ To run backanno, type **backanno** on the command line with, at minimum, the name of your input .udb file. A sample of a typical backanno command would be as follows:

```
backanno backanno.udb
```

### Note

The above command back annotates backanno.udb and generates a Verilog file backanno.v and an SDF file backanno.sdf. If the target files already exist, they will not be overwritten in this case. You would need to specify the **-w** option to overwrite them.

---

There are several command line options that give you control over the way backanno generates back-annotated netlists for simulation. Please refer to the rest of the subjects in this topic for more details.

### Command Line Syntax (Verilog)

**backanno** [-w] [-pre <prfx>] [-sp <grade>] [-neg] [-pos] [-sup] [-min] [-x] [-fc] [-slice] [-slice0] [-slice1] [-noslice] [-t] [-dis <del>]] [-m <limit>]] [-u] [-i] [-nopur] [-l <libtype>] [-s <separator>] [-o <verilog<<.v>>] [-d <delays[.sdf]>] [-gui] [-msg <msglogfile>] [-msgset <msgtypefile>] [<udbfile>]

### Backanno Options

The table below contains descriptions of all valid options for backanno.

**Table 13: Backanno Options**

| Option      | Description                                                                                                                                          |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| -w          | Overwrite the output files.                                                                                                                          |
| -sp <grade> | Override performance grade for backannotation.                                                                                                       |
| -pre <prfx> | Prefix to add to module name to make them unique for multi-chip simulation.                                                                          |
| -min        | Override performance grade to minimum timing for hold check.                                                                                         |
| -dis <del>  | Distribute routing delays by splitting the signal and inserting buffers. <del> is the maximum delay (in ps) between each buffer (1000ps by default). |
| -m <limit>  | Shortens the block names to a given character limit in terms of some numerical integer value.                                                        |
| -u          | Add pads for top-level dangling nets.                                                                                                                |
| -neg        | Negative setup/hold delay support. Without this option, all negative numbers are set to 0 in SDF.                                                    |
| -pos        | Write out 0 for negative setup/hold time in SDF for SC.                                                                                              |
| -x          | Generate x for setup/hold timing violation.                                                                                                          |
| -i          | Create a buffer for each block input that has interconnection delay.                                                                                 |
| -nopur      | Do not write PUR instance in the backannotation netlist. Instead, user has to instantiate it in a test bench.                                        |
| <type>      | Netlist type to write out.                                                                                                                           |
| <libtype>   | Library element type to use.                                                                                                                         |

**Table 13: Backanno Options**

| Option     | Description                                                                                                                                                                                                             |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <netfile>  | The name of the output netlist file. The extension on this file will change depending on which type of netlist is being written. Use -h <type>, where <type> is the output netlist type, for more specific information. |
| <udb file> | Input file '.udb '.                                                                                                                                                                                                     |

### Examples

Following are a few examples of backanno command lines and a description of what each does.

#### Example 1

The following command back annotates design.udb and generates a Verilog file design.vo and an SDF file design.sdf. If the target files exist, they will be overwritten.

```
backanno -w design.udb
```

#### Example 2

The following command back annotates design.udb and generates a Verilog file backanno.vo and an SDF file backanno.sdf. Any signal in the design that has an interconnection delay greater than 2000 ps (2 ns) will be split and a series of buffers will be inserted. The maximum interconnection delay between each buffer would be 2000 ps.

```
backanno -dis 2000 -o backanno design.udb
```

#### Example 3

The following command re-targets backannotation to performance grade -2, and puts a buffer at each block input to isolate the interconnection delay (ends at that input) and the pin to pin delay (starts from that input).

```
backanno -sp 2 -i design.udb
```

#### Example 4

The following command generates Verilog netlist and SDF files without setting the negative setup/hold delays to 0:

```
backanno -neg -n verilog design.udb
```

## Running Bit Generation from the Command Line

The **Bitstream** process in the Radiant software environment can also be run through the command line using the bit generation (**bitgen**) program. This topic provides syntax and option descriptions for usage of the **bitgen** program from the command line. The **bitgen** program takes a fully routed Unified Database (.udb) file as input and produces a configuration bitstream (bit images) needed for programming the target device.

Subjects included in this topic:

- [Running BITGEN](#)
- [iCE40UP Command Line Syntax](#)
- [All devices except iCE40UP Command Line Syntax](#)
- [BITGEN Options](#)
- [Examples](#)

### Running BITGEN

BITGEN uses your input, fully placed-and-routed Unified Database (.udb) file to produce bitstream (.bit, .msk, or .rpt) for device configuration.

- To run BITGEN, type **bitgen** on the command line with, at minimum, the **bitgen** command. There is no need to specify the input .udb file if you run **bitgen** from the directory where it resides and there is no other .udb present.

There are several command line options that give you control over the way BITGEN outputs bitstream for device configuration. Please refer to the rest of the subjects in this topic for more details.

### iCE40UP Command Line Syntax

```
bitgen [-d] [-b] [-a] [-w] [-noebrinitq1] [-noebrinitq2] [-noebrinitq3] [-noheader] [-simbitmap] [-nvcm] [-freq <frequency_bit_setting>] [-spilowpower] [-warmboot] [-nvcmsecurity] {-g <setting_value>} <infile> [<outfile>]
```

### All devices except iCE40UP Command Line Syntax

```
bitgen [-d] [-w] [-m <format>] [-g <opt:val>] [-f <*.t2b>] [-s <*.secproj>] {-site <seirule>} {-site <seitype>} <infile> [<outfile>]
```

### BITGEN Options

The table below contains descriptions of all valid options for BITGEN.

### Note

Many BITGEN options are only available for certain architectures. Please use the **bitgen -h <architecture>** help command to see a list of valid bitgen options for the particular device architecture you are targeting.

**Table 14: iCE40UP BITGEN Command Line Options**

| Option                                  | Description                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-d</b>                               | Disable DRC.                                                                                                                                                                                                                                                                                                                    |
| <b>-b</b>                               | Produce .rbt file (ASCII form of binary).                                                                                                                                                                                                                                                                                       |
| <b>-a</b>                               | Produce .hex file.                                                                                                                                                                                                                                                                                                              |
| <b>-w</b>                               | Overwrite an existing output file.                                                                                                                                                                                                                                                                                              |
| <b>-freq</b><br><frequency_bit_setting> | Can setup different frequency: 0 = slow, 1 = medium, 2 = fast.<br><br>Depending on the speed of external PROM, this options adjusts the frequency of the internal oscillator used by the iCE40UP device during configuration. This is only applicable when the iCE40UP device is used in SPI Controller Mode for configuration. |
| <b>-nvcm</b>                            | Produce NVCM file.                                                                                                                                                                                                                                                                                                              |
| <b>-nvcmsecurity</b>                    | Set security. Ensures that the contents of the Non-Volatile Configuration Memory (NVCM) are secure and the configuration data cannot be read out of the device.                                                                                                                                                                 |
| <b>-spilowpower</b>                     | SPI flash low power mode. Places the PROM in low-power mode after configuration.<br><br>This option is applicable only when the iCE40UP device is used as SPI Controller Mode for configuration.                                                                                                                                |
| <b>-warmboot</b>                        | Enable warm boot. Enables the Warm Boot functionality, provided the design contains an instance of the WARMBOOT primitive.                                                                                                                                                                                                      |
| <b>-noheader</b>                        | Do not include the bitstream header.                                                                                                                                                                                                                                                                                            |
| <b>-noebrinitq0</b>                     | Do not include EBR initialization for quadrant 0.                                                                                                                                                                                                                                                                               |
| <b>-noebrinitq1</b>                     | Do not include EBR initialization for quadrant 1.                                                                                                                                                                                                                                                                               |
| <b>-noebrinitq2</b>                     | Do not include EBR initialization for quadrant 2.                                                                                                                                                                                                                                                                               |
| <b>-noebrinitq3</b>                     | Do not include EBR initialization for quadrant 3.                                                                                                                                                                                                                                                                               |
| <b>-g NOPULLUP:ENABLED</b>              | No IO pullup. Removes the pullup on the unused I/Os, except Bank 3 I/Os which do not have pullup.                                                                                                                                                                                                                               |

**Table 14: iCE40UP BITGEN Command Line Options**

| Option                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-h</b> <architecture> or <b>-help</b> <architecture> | Display available BITGEN command options for the specified architecture. The <b>bitgen -h</b> command with no architecture specified will display a list of valid architectures.                                                                                                                                                                                                                                                      |
| <infile>                                                | The input post-PAR design database file (.udb).                                                                                                                                                                                                                                                                                                                                                                                       |
| <outfile>                                               | The output file. If you do not specify an output file, BITGEN creates one in the input file's directory. If you specify <b>-b</b> , the extension is .rbt. If you specify <b>-a</b> , the extension is .hex. If you specify <b>-nvc</b> , the extension is .nvc. Otherwise the extension is .bin.<br><br>A report (.bgn) file containing all of BITGEN's output is automatically created under the same directory as the output file. |

**Table 15: BITGEN Command Line Options (all devices except iCE40UP)**

| Option                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |         |                              |        |                |           |                |          |            |          |            |          |            |    |          |
|---------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|------------------------------|--------|----------------|-----------|----------------|----------|------------|----------|------------|----------|------------|----|----------|
| <b>-d</b>                                               | Disable DRC.                                                                                                                                                                                                                                                                                                                                                                                                                      |         |                              |        |                |           |                |          |            |          |            |          |            |    |          |
| <b>-w</b>                                               | Overwrite an existing output file.                                                                                                                                                                                                                                                                                                                                                                                                |         |                              |        |                |           |                |          |            |          |            |          |            |    |          |
| <b>-m</b> <format>                                      | Create "mask" and "readback" files. Valid formats are:<br>0: Output files in ASCII<br>1: Output files in binary.                                                                                                                                                                                                                                                                                                                  |         |                              |        |                |           |                |          |            |          |            |          |            |    |          |

| <b>-h</b> <architecture> or <b>-help</b> <architecture> | Display available BITGEN command options for the specified architecture. The <b>bitgen -h</b> command with no architecture specified will display a list of valid architectures.                                                                                                                                                                                                                                                  |         |                              |        |                |           |                |          |            |          |            |          |            |    |          |

**Table 15: BITGEN Command Line Options (all devices except iCE40UP)**

| Option    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <infile>  | The input post-PAR design database file (.udb).                                                                                                                                                                                                                                                                                                                                                                                             |
| <outfile> | <p>The output file. If you do not specify an output file, BITGEN creates one in the input file's directory. If you specify <b>-b</b>, the extension is .rpt. If you specify <b>-a</b>, the extension is .hex. If you specify <b>-nvcn</b>, the extension is .nvcn. Otherwise the extension is .bin.</p> <p>A report (.bgn) file containing all of BITGEN's output is automatically created under the same directory as the output file.</p> |

## Examples

### Example 1

The following command tells **bitgen** to overwrite any existing bitstream files with the **-w** option, prevents a physical design rule check (DRC) from running with **-d**, and specifies a Raw Bit File (.rpt) output with **-b**. Notice how these three options can be combined with the **-wdb** syntax.

```
bitgen -wdb <design.udb>
```

### Example 2

There are two command line options to set the SEI Editor tool with the following examples:

#### ► 1-bit Error Injection

```
bitgen -w <other options> -ebit 1 -sei unused -site
<unused site type> <des>.udb <output file>
    Avant: -where <unused site type> = [PFU | DSP | ANY]
    Nexus: -where <unused site type> = [PFU | DSP | EBR
| ANY]
```

#### ► Unused

```
bitgen -w -ebit 1 -sei unused -site PFU des.udb
des_partial.bit
```

#### ► Random

```
bitgen -w -ebit 1 -sei random - des.udb des_partial.bit
```

#### ► 2-bit Error Injection

```
bitgen -w <other options> -ebit 2 -sei unused -site
<unused site type> <des>.udb <output file>
    Avant: -where <unused site type> = [PFU | DSP | ANY]
    Nexus: -where <unused site type> = [PFU | DSP | EBR
| ANY]
```

▶ **Unused**

```
bitgen -w -ebit 2 -sei unused -site DSP des.udb  
des_partial.bit
```

```
bitgen -b -ebit 2 -sei unused -site DSP,DSP < udb design  
>
```

▶ **Random**

```
bitgen -w -ebit 2 -sei random des.udb des_partial.bit
```

---

**Note**

The <other options> option does not support compressed or encrypted partial bitstream, and if it includes “-b”, it generates an ASCII bitstream output file.

## Running Programmer from the Command Line

You can run Programmer from the command line. The **PGRCMD** command uses a keyword preceded by a hyphen for each command line option.

Subjects included in this topic:

### Running PGRCMD

PGRCMD allows you to download data files to an FPGA device.

- ▶ To run PGRCMD, type **pgrcmd** on the command line with, at minimum, the **pgrcmd** command.

There are several command line options that give you control over the way PGRCMD programs devices. Please refer to the rest of the subjects in this topic for more details.

### Command Line Syntax

The following describes the PGRCMD command line syntax:

**pgrcmd [-help] [-infile <input\_file\_path>] [-logfile <log\_file\_path>] [-cabletype <cable>]**

**-cabletype**

lattice [ **-portaddress** < 0x0378 | 0x0278 | 0x03bc | 0x<custom address> > ]

usb [ **-portaddress** < EZUSB-0 | EZUSB-1 | ... | EZUSB-15 > ]

usb2 [ **-portaddress** < FTUSB-0 | FTUSB-1 | ... | FTUSB-15 > ]

TCK [0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10]

**PGRCMD Options**

The following are PGRCMD options.

**Help (Optional)**

| Option                    | Description                                   |
|---------------------------|-----------------------------------------------|
| <b>-help</b> or <b>-h</b> | Displays the Programmer command line options. |

**Input File (required)**

| Option                             | Description                                                                                                  |
|------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>-infile</b> <i>filename.xcf</i> | Specifies the chain configuration file (.xcf). If the file path includes spaces, enclose the path in quotes. |

**Log File (optional)**

| Option                                 | Description                                        |
|----------------------------------------|----------------------------------------------------|
| <b>-logfile</b> <i>logfilename.log</i> | Specifies the location of the Programmer log file. |

**Cable Type (optional)**

| Option                    | Description                                                                      |
|---------------------------|----------------------------------------------------------------------------------|
| <b>-cabletype</b> lattice | Lattice HW-DLN-3C parallel port programming cable (default).                     |
| <b>-cabletype</b> usb     | Lattice HW-USBN-2A USB port programming cable.                                   |
| <b>-cabletype</b> usb2    | Lattice FHW-USBN-2B (FTDI) USB programming cable and any FTDI based demo boards. |

**Parallel Port Address (optional)**

| Option                                 | Description                  |
|----------------------------------------|------------------------------|
| <b>-portaddress</b> 0x0378             | LPT1 parallel port (default) |
| <b>-portaddress</b> 0x0278             | LPT2 parallel port           |
| <b>-portaddress</b> 0x03BC             | LPT3 parallel port           |
| <b>-portaddress</b> 0x<custom address> | Custom parallel port address |

This option is only valid with parallel port cables.

**USB Port Address (optional)**

| Option                                   | Description                                                  |
|------------------------------------------|--------------------------------------------------------------|
| <b>-portaddress</b> EZUSB-0 ... EZUSB-15 | HW-USBN-2A USB cable number 0 through 15                     |
| <b>-portaddress</b> FTUSB-0 ... FTUSB-15 | FTDI based demo board or FTDI USB2 cable number 0 through 15 |

Default is EZUSB-0 and FTUSB-0. Only valid with the USB port cables.

**FTDI Based Demo Board or Cable Frequency Control (optional)**

| Option                                       | Description                                                                                                                                                   |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-TCK</b> 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 | 0 = 30 MHz<br>1 = 15 MHz (default)<br>2 = 10 MHz<br>3 = 7.5 MHz<br>4 = 6 MHz<br>5 = 5 MHz<br>6 = 4 MHz<br>7 = 3 MHz<br>8 = 2 MHz<br>9 = 1 MHz<br>10 = 900 kHz |

Calculation formula for USB-2B (2232H FTDI USB host chip): Frequency = 60 MHz / (1 + ClockDivider) \*2

Calculation formula for USB-2B (2232D FTDI USB host chip): Frequency = 12 MHz / (1 + ClockDivider) \*2

Only applicable for FTDI based demo boards or programming cable.

### Return Codes

| Code | Definition                      |
|------|---------------------------------|
| 0    | Success                         |
| -1   | Log file error                  |
| -2   | Check configuration setup error |
| -3   | Out of memory error             |
| -4   | NT driver error                 |
| -5   | Cable not detected error        |
| -6   | Power detection error           |
| -7   | Device not valid error          |
| -8   | File not found error            |
| -9   | File not valid error            |
| -10  | Output file error               |
| -11  | Verification error              |
| -12  | Unsupported operation error     |
| -13  | File name error                 |
| -14  | File read error                 |
| -17  | Build SVF file error            |
| -18  | Build VME file error            |
| -19  | Command line syntax error       |

### Example

The following is a PGRCMD example.

```
pgrcmd -infile c:\test.xcf
```

# Running the Deployment Tool from the Command Line

You can run the Deployment Tool from the command line. The **DDTCMD** command uses a keyword preceded by a hyphen for each command line option.

## Note

If you use the Deployment Tool GUI, the correct command line for the operation you are performing will be displayed in the GUI in the "Step 4 of 4 - Generate Deployment" dialog box. The command line is also recorded in the Deployment Project File (\*.ddt). You can view the Deployment Project File with a text editor and view or copy the command line.

## Running DDTCMD

DDTCMD allows you to convert data files to other formats for one device at a time and devices in a chain. DDTCMD can also use the data files it produces to generate other data file formats.

- ▶ To run DDTCMD, type **ddtcmd** on the command line with, at minimum, the **ddtcmd** command.

There are several command line options that give you control over the way **DDTCMD** converts data files. Please refer to the rest of the subjects in this topic for more details.

## Command Line Syntax

The following describes the DDTCMD command line syntax:

```
<install_path>\ddtcmd
[ -h ] |
  -oft <-bit | rbt >
    [ -dev <Device Name> ]
    -if "<Data File Path>"
    [ -of "<Data File Path>" ]
    [ -compress <on | off> ]
    [ -verifyid <on | off> ]
    [ -freq ]
```

```

[ -crc <frame | global>]
[ -mirror]
[ -header]
[ -secure <on | off>]

### DDTCMD Options

The following are DDTCMD options.

| Option                        | Description                                                                    |
|-------------------------------|--------------------------------------------------------------------------------|
| <b>-h</b>                     | Displays the Deployment Tool command line usage in the terminal or DOS window. |
| <b>-oft &lt;File Type&gt;</b> | Indicates which file type(s) will be generated.                                |

| Option      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-bit</b> | <p>Generate binary bitstream file.</p> <p><b>-dev</b> &lt;Device Name&gt;: Indicates the name of the device (optional). The device name must be the full device name with the performance grade replaced with two X's, and minus the industry rating or the code name.</p> <p>Example:</p> <p>LFE3-17EA-XXFN484 (with performance grade replaced with two X's).</p> <p>The device name will default to the device name in the data file. If a device name cannot be found in the file, it will return an error unless the name has been given with the -dev option.</p> <p><b>-if</b> &lt;Data File Path&gt;: Indicates the input data file full path and file name. If the file path includes spaces, enclose the path in quotes.</p> <p><b>-of</b> "&lt;Data File Path&gt;": Indicates the output file path. If the file path includes spaces, enclose the path in quotes (optional). Default file name is the same name as the input file. binary bitstream files should end with the *.bit extension.</p> <p><b>-compress</b> &lt;on   off&gt;: Specifies compression (optional). Default is off.</p> <p><b>-verifyid</b>: On: Include the Verify ID frame. Off: Replaces Verify ID frame with NOOP (optional). Default is off.</p> <p><b>-freq</b>: Specifies the frequency of the master bitstream.</p> <p>Possible frequencies valid for LatticeEC/P, LatticeECP2/M, LatticeECP3, and LatticeXP/2 devices only are: 2.5, 4.3, 5.4, 6.9, 8.1, 9.2, 10, 13, 15, 20, 26, 30, 34, 41, 45, 51, 55, 60, and 130 MHz. Possible frequencies valid for MachXO2 and MachXO3L devices only are: 2.1, 2.5, 3.2, 4.3, 5.5, 7, 8.3, 9.2, 10, 13, 15, 20, 27, 30, 33, 38, 44, 53, 66, 89, and 133 MHz. Possible frequencies valid for ECP5 devices only are: 2.4, 3.2, 4.1, 4.8, 6.5, 8.2, 9.7, 12.9, 15.5, 16.3, 19.4, 20.7, 25.8, 31, 34.4, 38.8, 44.3, 51.7, 62, 77.5, 103.3, and 155 MHz.</p> <p><b>-crc</b> &lt;frame   global&gt;: The "frame" option includes the CRC checking for each data frame. The "global" option disables the frames CRC but still calculates the global CRC at the end of the configuration data. Default uses the settings of the input file. Valid for ECP5, LatticeECP2/M, LatticeECP2S/SM, LatticeECP3, MachXO3L, MachXO2, and LatticeXP/2 devices only.</p> <p><b>-secure</b> &lt;on   off&gt;: Specifies program security (optional). On: Programs the Security Fuse (blocks read back). Off: Does not program the Security Fuse (allows read back). Default uses the settings of the input file.</p> <p><b>-overwriteues on</b>: Overwrites (or replaces) the USERCODE value contained in the input file with the hex value passed in.</p> <p><b>Note</b>: The encryption software patch must be installed before using the following -<b>encryption -key</b> and <b>-config_mode</b> commands.</p> <p><b>-encryption -key hex</b> &lt;Valid Key Value&gt;: Encrypts the input file using the -key 128-bit encryption key.</p> <p><b>-config_mode</b> &lt;slave_scm   slave_pcm   jtag   spi   spim   master_pcm   slave_spi&gt;]: Selects the appropriate configuration mode for the bitstream encryption. Valid for LatticeECP2S/MS and LatticeECP3 devices only.</p> |

| Option      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>-int</b> | <p>Generate Intel 32-bit hex file.</p> <p><b>-dev</b> &lt;Device Name&gt;: Indicates the name of the device. Optional. The device name must be the full device name with the performance grade replaced with two X's, and minus the industry rating or the code name.</p> <p>Example:</p> <p>LFE3-17EA-XXFN484 (with performance grade replaced with two X's).</p> <p>The device name will default to the device name in the data file. If a device name cannot be found in the file, it will return an error unless the name has been given with the -dev option.</p> <p><b>-if</b> &lt;Data File Path&gt;: Indicates the input data file full path and file name. If the file path includes spaces, enclose the path in quotes.</p> <p><b>-of</b> "&lt;Data File Path&gt;": Indicates the output file path. If the file path includes spaces, enclose the path in quotes. Optional. Default file name is the same name as the input file. Intel files should end with the *.mcs extension.</p> <p><b>-compress</b> &lt;on   off&gt;: Specifies compression (optional). Default is off.</p> <p><b>-verifyid</b>: On: Include the Verify ID frame. Off: Replaces Verify ID frame with NOOP (optional). Default is off.</p> <p><b>-freq</b>: Specifies the frequency of the master bitstream.</p> <p>Possible frequencies valid for LatticeEC/P, LatticeECP2/M, LatticeECP3, and LatticeXP/2 devices only are: 2.5, 4.3, 5.4, 6.9, 8.1, 9.2, 10, 13, 15, 20, 26, 30, 34, 41, 45, 51, 55, 60, and 130 MHz.</p> <p>Possible frequencies valid for for MachXO2 and MachXO3L devices only are: 2.1, 2.5, 3.2, 4.3, 5.5, 7, 8.3, 9.2, 10, 13, 15, 20, 27, 30, 33, 38, 44, 53, 66, 89, and 133 MHz.</p> <p>Possible frequencies valid for for ECP5 devices only are: 2.4, 3.2, 4.1, 4.8, 6.5, 8.2, 9.7, 12.9, 15.5, 16.3, 19.4, 20.7, 25.8, 31, 34.4, 38.8, 44.3, 51.7, 62, 77.5, 103.3, and 155 MHz.</p> <p><b>-crc</b> &lt;frame   global&gt;: The "frame" option includes the CRC checking for each data frame. The "global" option disables the frames CRC but still calculates the global CRC at the end of the configuration data. Default uses the settings of the input file. Valid for ECP5, LatticeECP2/M, LatticeECP2S/SM, LatticeECP3, MachXO3L, MachXO2, and LatticeXP/2 devices only.</p> <p><b>-mirror</b>: Flips each byte. Default: bytes are not flipped. Optional.</p> <p><b>-header</b>: Retains the input file header in the output file. Default: Replaces header with all ones (0xFF). Optional.</p> <p><b>-secure</b> &lt;on   off&gt;: Specifies program security (optional). On: Programs the Security Fuse (blocks read back). Off: Does not program the Security Fuse (allows read back). Default uses the settings of the input file.</p> <p><b>-overwriteues on</b>: Overwrites (or replaces) the USERCODE value contained in the input file with the hex value passed in.</p> <p><b>Note</b>: The encryption software patch must be installed before using the following -<b>encryption -key</b> and <b>-config_mode</b> commands.</p> <p><b>-encryption -key hex</b> &lt;Valid Key Value&gt;: Encrypts the input file using the -key 128-bit encryption key.</p> |

| Option              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>-mot</b>         | <p>Generate Motorola 32-bit hex file.</p> <p><b>-dev</b> &lt;Device Name&gt;: Indicates the name of the device. Optional. The device name must be the full device name with the performance grade replaced with two X's, and minus the industry rating or the code name.</p> <p>Example:</p> <p>LFE3-17EA-XXFN484 (with performance grade replaced with two X's).</p> <p>The device name will default to the device name in the data file. If a device name cannot be found in the file, it will return an error unless the name has been given with the -dev option.</p> <p><b>-if</b> &lt;Data File Path&gt;: Indicates the input data file full path and file name. If the file path includes spaces, enclose the path in quotes.</p> <p><b>-of</b> "&lt;Data File Path&gt;": Indicates the output file path. If the file path includes spaces, enclose the path in quotes. Optional. Default file name is the same name as the input file. Motorola files should end with the *.exo extension.</p> <p><b>-compress</b> &lt;on   off&gt;: Specifies compression (optional). Default is off.</p> <p><b>-verifyid</b>: On: Include the Verify ID frame. Off: Replaces Verify ID frame with NOOP (optional). Default is off.</p> <p><b>-freq</b>: Specifies the frequency of the master bitstream.</p> <p>Possible frequencies valid for LatticeEC/P, LatticeECP2/M, LatticeECP3, and LatticeXP/2 devices only are: 2.5, 4.3, 5.4, 6.9, 8.1, 9.2, 10, 13, 15, 20, 26, 30, 34, 41, 45, 51, 55, 60, and 130 MHz.</p> <p>Possible frequencies valid for MachXO2 and MachXO3L devices only are: 2.1, 2.5, 3.2, 4.3, 5.5, 7, 8.3, 9.2, 10, 13, 15, 20, 27, 30, 33, 38, 44, 53, 66, 89, and 133 MHz.</p> <p>Possible frequencies valid for ECP5 devices only are: 2.4, 3.2, 4.1, 4.8, 6.5, 8.2, 9.7, 12.9, 15.5, 16.3, 19.4, 20.7, 25.8, 31, 34.4, 38.8, 44.3, 51.7, 62, 77.5, 103.3, and 155 MHz.</p> <p><b>-crc</b> &lt;frame   global&gt;: The "frame" option includes the CRC checking for each data frame. The "global" option disables the frames CRC but still calculates the global CRC at the end of the configuration data. Default uses the settings of the input file. Valid for ECP5, LatticeECP2/M, LatticeECP2S/SM, LatticeECP3, MachXO3L, MachXO2, and LatticeXP/2 devices only.</p> <p><b>-mirror</b>: Flips each byte. Default: bytes are not flipped. Optional.</p> <p><b>-header</b>: Retains the input file header in the output file. Default: Replaces header with all ones (0xFF). Optional.</p> <p><b>-secure</b> &lt;on   off&gt;: Specifies program security (optional). On: Programs the Security Fuse (blocks read back). Off: Does not program the Security Fuse (allows read back). Default uses the settings of the input file.</p> |

| Option              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>-xtek</b>        | <p>Generate Tektronix Extended hex file</p> <p><b>-dev</b> &lt;Device Name&gt;: Indicates the name of the device (optional). The device name must be the full device name with the performance grade replaced with two X's, and minus the industry rating or the code name.</p> <p>Example:</p> <p>LFE3-17EA-XXFN484 (with performance grade replaced with two X's).</p> <p>The device name will default to the device name in the data file. If a device name cannot be found in the file, it will return an error unless the name has been given with the -dev option.</p> <p><b>-if</b> &lt;Data File Path&gt;: Indicates the input data file full path and file name. If the file path includes spaces, enclose the path in quotes.</p> <p><b>-of</b> "&lt;Data File Path&gt;": Indicates the output file path. If the file path includes spaces, enclose the path in quotes. Optional. Extended Tektronix files should end with the *.xtek extension.</p> <p><b>-compress</b> &lt;on   off&gt;: Specifies compression (optional). Default is off.</p> <p><b>-verifyid:</b> On: Include the Verify ID frame. Off: Replaces Verify ID frame with NOOP (optional). Default is off.</p> <p><b>-freq:</b> Specifies the frequency of the master bitstream.</p> <p>Possible frequencies valid for LatticeEC/P, LatticeECP2/M, LatticeECP3, and LatticeXP/2 devices only are: 2.5, 4.3, 5.4, 6.9, 8.1, 9.2, 10, 13, 15, 20, 26, 30, 34, 41, 45, 51, 55, 60, and 130 MHz.</p> <p>Possible frequencies valid for MachXO2 and MachXO3L devices only are: 2.1, 2.5, 3.2, 4.3, 5.5, 7, 8.3, 9.2, 10, 13, 15, 20, 27, 30, 33, 38, 44, 53, 66, 89, and 133 MHz.</p> <p>Possible frequencies valid for ECP5 devices only are: 2.4, 3.2, 4.1, 4.8, 6.5, 8.2, 9.7, 12.9, 15.5, 16.3, 19.4, 20.7, 25.8, 31, 34.4, 38.8, 44.3, 51.7, 62, 77.5, 103.3, and 155 MHz.</p> <p><b>-crc</b> &lt;frame   global&gt;: The "frame" option includes the CRC checking for each data frame. The "global" option disables the frames CRC but still calculates the global CRC at the end of the configuration data. Default uses the settings of the input file. Valid for ECP5, LatticeECP2/M, LatticeECP2S/SM, LatticeECP3, MachXO3L, MachXO2, and LatticeXP/2 devices only.</p> |

| Option               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-xtek (cont.)</b> | <p><b>-mirror</b>: Flips each byte. Default: bytes are not flipped (optional).</p> <p><b>-header</b>: Retains the input file header in the output file. Default: Replaces header with all ones (0xFF) (optional).</p> <p><b>-secure</b> &lt;on   off&gt;: Specifies program security (optional). On: Programs the Security Fuse (blocks read back). Off: Does not program the Security Fuse (allows read back). Default uses the settings of the input file.</p> <p><b>overwriteues on</b>: Overwrites (or replaces) the USERCODE value contained in the input file with the hex value passed in.</p> <p><b>Note</b>: The encryption software patch must be installed before using the following <b>-encryption -key</b> and <b>-config_mode</b> commands.</p> <p><b>-encryption -key hex</b> &lt;Valid Key Value&gt;: Encrypts the input file using the -key 128-bit encryption key.</p> <p><b>-config_mode</b> &lt;slave_scm   slave_pcm   jtag   spi   spim   master_pcm   slave_spi&gt;]: Selects the appropriate configuration mode for the bitstream encryption. Valid for LatticeECP2S/MS and LatticeECP3 devices only.</p> <p><b>-address</b> &lt;hex address&gt; Specifies the starting address of the memory device to store the input file.</p> <p><b>-fast</b>: Using this option, the FPGA will issue the Fast Read command (0x0B) to the SPI Flash, instead of the Slow Read command (0x03). Valid for ECP5.</p>                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>-svf</b>          | <p>Generate SVF file for a single device.</p> <p><b>-dev</b> &lt;Device Name&gt;: Indicates the name of the device. Optional. The device name must be the full device name with the performance grade replaced with two X's, and minus the industry rating or the code name.</p> <p>Example:</p> <p>LCMX02-256ZE-XXMG64 (with performance grade replaced with two X's).</p> <p>The device name will default to the device name in the data file. If a device name cannot be found in the file, it will return an error unless the name has been given with the -dev option.</p> <p><b>-if</b> &lt;Data File Path&gt;: Indicates the input data file full path and file name. If the file path includes spaces, enclose the path in quotes.</p> <p><b>-of</b> "&lt;Data File Path&gt;": Indicates the output file path. If the file path includes spaces, enclose the path in quotes (optional). Default file name is the same name as the input file. SVF files should end with the *.svf extension.</p> <p><b>-op</b> Indicates the operation. The operation list varies depending on the device family. Use the Deployment Tool GUI to create the command line.</p> <p><b>-nocomments</b>: Omit Header and Comments from SVF file (optional). Default includes Header and Comments.</p> <p><b>-revd</b>: Generate Rev D standard SVF file (optional). Default generates Lattice Extended SVF file (not supported by all third party tools).</p> <p><b>-runtest</b>: Uses RUNTEST format from SVF revision C (optional). Default is revision D SVF file.</p> <p><b>-skipverify</b>: Generates an SVF without the verify portion (optional).</p> <p><b>-reset</b>: Writes RESET in the SVF file (optional).</p> <p><b>-maxdata</b> [&lt;8   16   32   64   128   256&gt; ]: Specifies the maximum data size per row (in Kbits) (optional).</p> |

| Option           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>-cpu</b>  | <p>Generates sysCONFIG CPU Embedded file.</p> <p><b>-if</b> &lt;Data File Path&gt;: Indicates the input data file full path and file name. If the file path includes spaces, enclose the path in quotes.</p> <p><b>-of</b> "&lt;Data File Path&gt;": Indicates the output file path. If the file path includes spaces, enclose the path in quotes (optional). Default uses the input file name with the extension of the selected <b>-type</b>.</p> <p><b>-type</b> &lt;cpu   c   hex   txt&gt;: Indicates whether file is in binary embedded (cpu), C-code (c), Intel Hex (hex), or Text debug only (txt) format.</p> <p><b>-verify</b>: Generates a sysCONFIG Embedded file that includes a verify operation.</p> <p><b>-comment</b>: Include comments in sysCONFIG Embedded file (optional).</p> <p><b>-nocompress</b>: Do not compress data (optional).</p> <p><b>-mirror</b>: Flips each byte. Default: bytes are not flipped (optional).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>-boot</b> | <p>Generate Dual Boot Hex file.</p> <p><b>-dev</b> &lt;Device Name&gt;: Indicates the name of the device (optional). The device name must be the full device name with the performance grade replaced with two X's, and minus the industry rating or the code name.</p> <p>Example:</p> <p>LFE3-17EA-XXFN484 (with performance grade replaced with two X's).</p> <p>The device name will default to the device name in the data file. If a device name cannot be found in the file, it will return an error unless the name has been given with the -dev option.</p> <p><b>-golden</b> "&lt;Golden File Path&gt;" <b>-primary</b> "&lt;Primary File Path&gt;": Merges the Golden, Primary, and a JUMP command into one Hex file. The address location of the Golden, Primary, and JUMP command depends on the files sizes and the target device. The Deployment Tool will record the address location of each in the Status window and log file.</p> <p><b>-format</b> &lt;intel   motorola   xtek &gt;: Specifies the output format as Intel, Motorola, or Tektronix Extended Hex. The default format is Intel Hex (optional). Default uses the input file name with *.mcs, *exo, or *.xtek extension, depending on format type selected.</p> <p><b>-of</b> "&lt;Data File Path&gt;": Indicates the output file path. If the file path includes spaces, enclose the path in quotes (optional). Default uses the input file name with *.mcs, *exo, or *.xtek extension, depending on format type selected.</p> <p><b>-flashsize</b>: Specifies size in Mb.</p> <p>Possible PROM sizes are 1, 2, 4, 8, 16, 32, 64, 128, 256, and 513 (512Mb).</p> <p>Default: 1.</p> |

| Option               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-boot (cont.)</b> | <p><b>-protect:</b> Inserts the Golden File at the beginning of the upper half of the SPI flash (optional). This allows the upper half of the SPI flash to be write-protected, which protects the Golden File from accidental erase or reprogram.</p> <p><b>-mirror:</b> Flips each byte. Default: bytes are not flipped (optional).</p> <p><b>-header:</b> Retains the input file header in the output file. Default: Replaces header with all ones (0xFF) (optional).</p> <p><b>-preamble:</b> Replaces the header Preamble of the primary bitstream with 0xFFs (for Fail Safe Upgrade feature) (optional).</p> <p><b>-optimize:</b> Uses the files size of the input files to determine SPI flash sector addresses for each input file. Use this option to minimize wasted memory space. The default is to use worst case file size for the target device, which is an uncompressed file with all EBR and PCS, depending on the family. Using the worst case will ensure that all files will always be located at the same address even if any of the files/designs are updated at a later date.</p> <p><b>-asc &lt;1   2   3   4   5   6   7   8&gt;</b> Indicates the number of ASC devices connected to the MachXO2 or Platform Manager 2 device. The maximum number that can be used with the MachXO2 device is 8. The maximum number that can be used with the Platform Manager 2 device is 7. The input JEDEC file and the ASC Hex files will be merged into one Hex file that can be programmed into an external SPI Flash device for Dual Boot support. Optional.</p> <p><b>-ascfile "&lt;Data File Path&gt;":</b> Specifies the ASC Hex file path and name. If the file path includes spaces, enclose the path in quotes. There must be one "-ascfile" and path for each ASC specified by the "-asc" Optional.</p> <p><b>&lt;-fast   -dualio   -quad 1&gt;:</b> With the -fast option, the FPGA will issue the Fast Read command (0x0B) to the SPI Flash. The -dualio option must be used if a Dual I/O SPI Flash is used. The -quad 1 option must be used if a Quad I/O SPI Flash is used. Only one of these options (-fast, -dualio, -quad 1) can be used. Without any of these options, the FPGA uses the Slow Read command (0x03). Valid for ECP5.</p> <p><b>-encryption -key hex &lt;Valid Key Value&gt;:</b> Encrypts the input file using the -key 128-bit encryption key.</p> |

| Option      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-jed</b> | <p>Generates JEDEC file.</p> <p><b>-if</b> &lt;Data File Path&gt;: Indicates the input data file full path and file name. If the file path includes spaces, enclose the path in quotes.</p> <p><b>-dev</b> &lt;Device Name&gt;: Indicates the name of the device (optional). The device name must be the full device name with the performance grade replaced with two X's, and minus the industry rating or the code name.</p> <p>Example:</p> <p>LCMX02-256ZE-XXMG64 (with performance grade replaced with two X's).</p> <p>The device name will default to the device name in the data file. If a device name cannot be found in the file, it will return an error unless the name has been given with the -dev option.</p> <p><b>-of</b> "&lt;Data File Path&gt;": Indicates the output file path. If the file path includes spaces, enclose the path in quotes (optional). Default uses the input file name with *.jed extension.</p> <p><b>-overwriteues &lt;on&gt;</b>: Overwrites (or replaces) the USERCODE value contained in the input file with the hex value passed in. The Checksum option overwrites the USERCODE with the JEDEC file fuse checksum value. The Disable option omits the USERCODE from the JEDEC file.</p> <p><b>Note</b>: The encryption software patch must be installed before using the following -<b>encryption -key</b> commands.</p> <p><b>-encryption -key hex</b> &lt;Valid Key Value&gt;: Encrypts the input file using the -key 128-bit encryption key.</p> |

| Option           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-advanced</b> | <p>Generates Advanced SPI Flash Hex file.</p> <p><b>-dev</b> &lt;Device Name&gt;: Indicates the name of the device (optional). The device name must be the full device name with the performance grade replaced with two X's, and minus the industry rating or the code name.</p> <p>Example:</p> <p>LFE3-17EA-XXFN484 (with performance grade replaced with two X's).</p> <p>The device name will default to the device name in the data file. If a device name cannot be found in the file, it will return an error unless the name has been given with the -dev option.</p> <p><b>-if</b> &lt;Data File Path&gt;: Indicates the input data file full path and file name. If the file path includes spaces, enclose the path in quotes.</p> <p><b>-format</b> &lt;intel   motorola   xtek &gt;: Specifies the output format as Intel, Motorola, or Tektronix Extended Hex. The default format is Intel Hex (optional).</p> <p><b>-of</b> "&lt;Data File Path&gt;": Indicates the output file path. If the file path includes spaces, enclose the path in quotes (optional). Default uses the input file name with *.mcs, *.exo, or *.xtek extension, depending on the format selected.</p> <p><b>-flashsize</b>: Specifies size in Mb. Possible PROM sizes are 512 (512Kb), 1, 2, 4, 8, 16, 32, 64, 128, 256, and 513 (512Mb). Default: 1.</p> <p><b>-mirror</b>: Flips each byte. Default: bytes are not flipped (optional).</p> <p><b>-header</b>: Retains the input file header in the output file. Default: Replaces header with all ones (0xFF) (optional).</p> <p><b>-preamble</b>: Replaces the header Preamble of the bitstream with 0xFFs (for Fail Safe Upgrade feature) (optional).</p> <p><b>-userdata</b> &lt;1   2   3   4   5   6   7   8   9   10   11   12   13   14   15   16&gt; Number of data files.</p> <p><b>-userdata</b>: Flips each byte of the user data files. Default: bytes are not flipped (optional).</p> <p><b>-userfile</b> "&lt;Data File Path&gt;" Indicates the input user data file path and file name. Must be specified for each user data file (<b>-userdata</b>).</p> <p><b>-address</b> &lt;hex address value&gt;: SPI flash address location for the user data file. Must be specified for each user data file (<b>-userdata</b>).</p> <p><b>-optimize</b>: Uses the files size of the input files to determine SPI flash sector addresses for each input file. Use this option to minimize wasted memory space. The default is to use worst case file size for the target device, which is an uncompressed file with all EBR and PCS, depending on the family. Using the worst case will ensure that all files will always be located at the same address even if any of the files/designs are updated at a later date.</p> <p><b>-ice</b>: iCE40 warm boot cold boot.</p> <p><b>-warm</b> &lt;1   2   3   4&gt;: Optional. Default is cold boot. The <b>-warm</b> selects warm boot. The number selects the first boot configuration file.</p> <p><b>-patterns</b> &lt;2,3,4&gt;: Specifies the number of iCE40 configuration files.</p> <p><b>-bootfile</b> "&lt;Data File Path&gt;": Indicates the input configuration file path and name. Must be specified for each configuration file (<b>-patterns</b>).</p> <p><b>-address</b> &lt;hex address value&gt;: SPI flash address location for the configuration file. Must be specified for each configuration file (<b>-patterns</b>).</p> <p><b>&lt;-fast   -dualio   -quad 1&gt;</b>: With the -fast option, the FPGA will issue the Fast Read command (0x0B) to the SPI Flash. The -dualio option must be used if a Dual I/O SPI Flash is used. The -quad option must be used if a Quad I/O SPI Flash is used. Only one of these options (-fast, -dualio, -quad 1) can be used. Without any of these options, the FPGA uses the Slow Read command (0x03). Valid for ECP5.</p> |

| Option                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-advanced (cont.)</b> | <p><b>-multi</b> &lt;1   2   3   4&gt; Optional. The -multi option selects Multiple Boot. The number selects the number of alternate files. Must be used in conjunction with Dual Boot, since dual boot is a subset of Multiple Boot feature. The Golden file must also be selected. The data file passed in using the -if option is considered the Primary file.</p> <p><b>-golden</b> "&lt;Data File Path&gt;" Indicates the Golden file path and file name.</p> <p><b>-altfile</b> "&lt;Data File Path&gt;" Indicates the alternate file path and name. Must specify the alternate file for each number following the -multi option.</p> <p><b>-address</b> &lt;hex address value&gt; SPI Flash address location for the alternate file. Must be specified for each alternate file (-altfile).</p> <p><b>-next</b> &lt;primary   alt1   alt2   alt3   alt4&gt; Indicates which will be the next pattern to boot from when the PROGRAMN pin is toggle, or the Refresh command is issued. Must be specified for each alternate file (-altfile).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>-merge</b>            | <p><b>-ifdev1</b> "&lt;Data File Path&gt;" Indicates the input dta file full path and file name for the first device in the chain. If the file path includes spaces.</p> <p><b>-ifdev2</b> "&lt;Data File Path&gt;" "Second device in the chain."</p> <p><b>-format</b> &lt;intel   motorola   xtek &gt;: Specifies the output format as Intel, Motorola, or Tektronix Extended Hex. The default format is Intel Hex (optional).</p> <p><b>-of</b> "&lt;Data File Path&gt;": Indicates the output file path. If the file path includes spaces, enclose the path in quotes (optional). Default uses the input file name with *.mcs, *.exo, or *.xtek extension, depending on the format selected.</p> <p><b>-mergeformat</b> &lt;intelligent   combine&gt; Intelligent merge will set the appropriate bits in the bitstream to support sysCONFIG Daily Chaining. Combine will merge the two files without changing any bits in the bitstreams.</p> <p><b>-freq</b>: Specifies the frequency of the master bitstream.</p> <p>Possible frequencies valid for LatticeEC/P, LatticeECP2/M, LatticeECP3, and LatticeXP/2 devices only are: 2.5, 4.3, 5.4, 6.9, 8.1, 9.2, 10, 13, 15, 20, 26, 30, 34, 41, 45, 51, 55, 60, and 130 MHz.</p> <p>Possible frequencies valid for MachXO2 and MachXO3L devices only are: 2.1, 2.5, 3.2, 4.3, 5.5, 7, 8.3, 9.2, 10, 13, 15, 20, 27, 30, 33, 38, 44, 53, 66, 89, and 133 MHz.</p> <p>Possible frequencies valid for ECP5 devices only are: 2.4, 3.2, 4.1, 4.8, 6.5, 8.2, 9.7, 12.9, 15.5, 16.3, 19.4, 20.7, 25.8, 31, 34.4, 38.8, 44.3, 51.7, 62, 77.5, 103.3, and 155 MHz.</p> <p><b>-scoutput</b> &lt;dout   qout&gt;: For LatticeSC/M devices, indicates if the output pin is Dout or Qout.</p> <p><b>-mirror</b>: Flips each byte. Default: bytes are not flipped (optional).</p> <p><b>-header</b>: Retains the input file header in the output file. Default: Replaces header with all ones (0xFF). Optional.</p> |

| Option          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-bsm</b>     | <p>Generates Application Specific BSDL file.</p> <p><b>-ifd</b> "&lt;Data File Path&gt;": Indicates the input data file full path and file name. If the file name includes spaces ...</p> <p><b>-ifb</b> "&lt;BSDL File Path&gt;": Indicates the input BSDL file full path and file name. If the file path includes spaces ...</p> <p><b>-dev</b> &lt;Device Name&gt;: Indicates the name of the device (optional). The device name must be the full device name with the performance grade replaced with two X's, and minus the industry rating or the code name.</p> <p>Example:</p> <p>LCMXO2-256ZE-XXMG64 (with performance grade replaced with two X's).</p> <p>The device name will default to the device name in the data file. If a device name cannot be found in the file, it will return an error unless the name has been given with the -dev option.</p> <p><b>-of</b> "&lt;Data File Path&gt;": Indicates the output file path. If the file path includes spaces, enclose the path in quotes (optional). Default uses the input file name with *.??? extension.</p> <p><b>-convertbidi</b>: Converts bidirectional I/Os to input or output only, based on the user's design. Default is to keep all bidirectional I/Os as bidirectional (optional).</p> |
| <b>-jed2hex</b> | Generates an ASCII Raw Hex file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>-jed2bin</b> | Generates a Binary Raw Hex file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Examples** The following are DDTCMD examples.

#### Tester Examples:

##### SVF - Single Device:

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -svfsingle -if
"C:/example/lfxp2_05ef256.jed" -dev LFXP2-5E -op "FLASH
Erase,Program,Verify" -of "C:/ example/
lfxp2_05ef256.svf"
```

##### SVF - JTAG Chain:

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -svfchain -if
"C:/example/demo.xcf" -of "C:/ example/demo.svf"
```

##### STAPL - Single Device:

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -stpsingle -if
"C:/example/ isppac_powr1220at8.jed" -dev ispPAC-
POWR1220AT8 -op "Erase,Program,Verify" -of "C:/ example/
isppac_powr1220at8.svf"
```

##### STAPL - JTAG Chain:

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -stpchain -if
"C:/example/demo.xcf" -of "C:/example/demo.svf"
```

**ATE - Generic Vector Format:**

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -ate -if " C:/example/demo.xcf " -type tst -of " C:/example/demo.tst"
```

**ATE - GenRad:**

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -ate -if " C:/example/demo.xcf " -type gr -of " C:/example/demo.gr"
```

**ATE - HP3070:**

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -ate -if " C:/example/demo.xcf " -type hp3070 -of " C:/example/demo.pcf"
```

**ATE - HP3065:**

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -ate -if " C:/example/demo.xcf " -type hp3065 -of " C:/example/demo.pcf"
```

**ATE - Teradyne 1800:**

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -ate -if " C:/example/demo.xcf " -type t1800 -of " C:/example/demo.asc"
```

**ATE - Teradyne L200/300:**

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -ate -if " C:/example/demo.xcf " -type t200 -of " C:/example/demo.asc"
```

**Embedded System Examples:****JTAG Full VME Embedded:**

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -fullvme -if "C:/example/demo.xcf" -of "C:/example/demo.vme"
```

**JTAG Slim VME Embedded:**

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -slimvme -if "C:/example/demo.xcf" -ofa "C:/example/demo_algo.vme" -ofd "C:/example/demo_data.vme"
```

**Slave SPI Embedded:**

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -sspi -if "C:/example/demo.xcf" -ofa "C:/example/demo_algo.sea" -ofd "C:/example/demo_data.sed"
```

**I2C Embedded:**

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -i2c -if "C:/example/demo.xcf" -ofa "C:/example/demo_algo.iew" -ofd "C:/example/demo_data.iew"
```

**sysCONFIG (CPU) Embedded - Binary:**

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -cpu -if "C:/example/demo.xcf" -type cpu -of "C:/example/demo_algo.cpu"
```

**sysCONFIG (CPU) Embedded - C-Code:**

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -cpu -if "C:/example/demo.xcf" -type c -of "C:/example/demo_algo.c"
```

**sysCONFIG (CPU) Embedded - Intel Hex:**

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -cpu -if "C:/example/demo.xcf" -type hex -of "C:/example/demo_algo.hex"
```

**sysCONFIG (CPU) Embedded - Text (Debug Only):**

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -cpu -if "C:/example/demo.xcf" -type txt -of "C:/example/demo_algo.txt"
```

**External Memory Examples:****Hex Conversion - Intel Hex:**

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -int -dev LFE2-6E -if "C:/example/lfec2_06ef256.bit" -of "C:/example/lfec2_06ef256.mcs"
```

**Hex Conversion - Motorola Hex:**

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -mot -dev LFE2-6E -if "C:/example/lfec2_06ef256.bit" -of "C:/example/lfec2_06ef256.exo"
```

**Hex Conversion - Extended Tektronix Hex:**

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -xtek -dev LFE2-6E -if "C:/example/lfec2_06ef256.bit" -of "C:/example/lfec2_06ef256.xtek"
```

**Dual Boot - Intel Hex:**

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -boot -dev LFE3-95E -golden "C:/example/lfec3_095_golden.bit" -primary "C:/example/lfec3_095.bit" -format int -flashsize 64 -of "C:/example/lfec3_095_dual_boot.mcs"
```

**Dual Boot - Motorola Hex:**

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -boot -dev LFE3-95E -golden "C:/example/lfec3_095_golden.bit" -primary "C:/example/lfec3_095.bit" -format mot -flashsize 64 -of "C:/example/lfec3_095_dual_boot.exo"
```

**Dual Boot - Extended Tektronix Hex:**

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -boot -dev LFE3-95E -golden "C:/example/lfec3_095_golden.bit" -primary "C:/example/lfec3_095.bit" -format xtek -flashsize 64 -of "C:/example/lfec3_095_dual_boot.xtek"
```

**File Conversion Examples:****Bitstream - Binary Bitstream:**

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -bit -dev LFXP2-5E -if "C:/example/lfxp2_05ef256.jed" -of "C:/example/lfxp2_05ef256.bit"
```

**Bitstream - ASCII Bitstream:**

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd" -oft -rbt -dev LFE2-6E -if "C:/example/lfec2_06ef256.bit" -of "C:/example/lfec2_06ef256.rbt"
```

**JEDEC - Hex and JEDEC - Binary:**

```
"C:/lsc/radiant/3.5/bin/nt/ddtcmd -oft <jed2hex|jed2bin> [-dev <Device Name>] -if "<Data File Path>" [-of "<Data File Path>"]
```

## Return Codes

| Code | Definition                       |
|------|----------------------------------|
| 0    | CMD_SUCCESS                      |
| -1   | ERROR_LOG_FILE                   |
| -2   | OUT_MEMORY                       |
| -3   | CANNOT_WRITE_DIRECTORY           |
| -4   | ERROR_CONFIGURATION_SETUP        |
| -5   | DEVICE_NAME_NOT_FOUND            |
| -6   | FILE_NOT_FOUND                   |
| -7   | FILE_NOT_VALID                   |
| -8   | UNKNOWN_OPERATION                |
| -9   | TOO_MANY_CHIPS                   |
| -10  | FILE_NOT_JEDEC                   |
| -11  | ERROR_OUTPUT_FILE                |
| -12  | OPERATION_NOT_SUPPORT            |
| -13  | FILE_NAME_ERROR                  |

## Running SSPI from the Command Line

You can run `sspi_cmd` to execute SSPI commands for Nexus and Avant devices from the command line. This tool interacts with the configuration engine via SPI protocol, ideal for testing when the SPI host is unavailable, offering enhanced flexibility and automation.

Subjects included in this topic:

- ▶ [sspi\\_cmd Features](#)
- ▶ [Usage](#)
- ▶ [sspi\\_cmd Options](#)
- ▶ [Example Command Outputs](#)

### sspi\_cmd Features

- ▶ **Detection of Programming Cables** – Lists all detected programming cables connected to the machine.
- ▶ **TCK Frequency Adjustment** – Allows you to change the TCK frequency.
- ▶ **Target Cable Specification** – Enables you to specify the target cable for running SSPI commands.
- ▶ **Command Input** – Accepts SSPI commands as input.
- ▶ **Hex String Data Input** – Takes hex string data as input.
- ▶ **Output Definition** – Defines the expected number of bytes for the output.
- ▶ **Data Output Capture** – Prints the captured data output.
- ▶ **Bit File Configuration** – Supports SSPI configuration using bit files.

### Usage

`sspi_cmd` is a standalone executable and can be found in:

```
<installer_path>\programmer\radiant\version_number\bin\<platform>\sspi_cm  
d
```

## sspi\_cmd Options

The following are sspi\_cmd options.

| Option    | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-h</b> | <b>--help</b> : Print this help message and exit<br><b>--listcables</b> : Lists all detected programming cables<br><b>--list-supported-devices</b> : Lists all supported devices                                                                                                                                                                                                                                                  |

| <b>-v</b> | <b>--verbose BOOLEAN</b> : Enables Verbose Message Print<br><b>--print-examples</b> : Prints usage examples<br><b>--version</b> : Print tool version                                                                                                                                                                                                                                                                              |

## Example Command Outputs

### ► Lists all detected programming cables

```
sspi_cmd --listcables
```

### ► List all supported devices along with their JTAG ID

```
sspi_cmd --list-supported-devices
```

### ► Specify cable index using --cable, use --listcables to know the indexes

```
sspi_cmd --cable 0 --device LFMX05-25 --command 0xE0 --
bytes-out 4
```

### ► Send an SSPI command in hex –

```
sspi_cmd --device LFMX05-25 --command 0xE0 --bytes-out 4 //
[ Default cable index 0]
sspi_cmd --cable 1 --device LFMX05-25 --command 0xE0 --
bytes-out 4
```

### ► Specify input data for the SSPI command

```
sspi_cmd --cable 0 --device LFMX05-25 --command 0xB4 --data
0x12345678
```

► **Specify opcode along with input data for the SSPI command**

```
sspi_cmd --cable 0 --device LFMX05-25 --command 0xB4 --
opcode 0x00000000 --data 0x12345678
```

► **Program Bitstream file**

```
sspi_cmd --device LFMX05-25 --program --file "c:/my_design/
cram.bit"
```

► **Use --verbose to print detailed mode**

```
sspi_cmd --device LFMX05-25 --command 0xE0 --bytes-out 4 --
verbose 1
```

► **Use '--nCS\_control hold' to assert chip select before command and do not de-assert after command**

```
sspi_cmd --nCS_control hold --device LFMX05-25 --command
0xE0 --bytes-out 4
```

### TCK\_DELAY Details

This option allows you to slow down the TCK clock. It is the same as the **TCK Divider** setting in Programmer. Clock slow down is done by extending the low period of the clock. Valid values for TCK\_DELAY are between 0 to 30.

Refer to the following tables for specific frequency settings for USB-2B (2232H FTDI USB host chip), USB-2B (2232D FTDI USB host chip), and USB-2A cables.

**Table 16: USB-2B (2232H FTDI USB host chip)**

| Divider | Clock Frequency <sup>1</sup> | Divider | Clock Frequency <sup>1</sup> |
|---------|------------------------------|---------|------------------------------|
| 0       | 30 MHz                       | 5       | 5 MHz                        |
| 1       | 15 MHz (Default)             | 6       | 4.2 MHz                      |
| 2       | 10 MHz                       | 7       | 3.7 MHz                      |
| 3       | 7.5 MHz                      | 8       | 3.1 MHz                      |
| 4       | 6 MHz                        | 9       | 3 MHz                        |
|         |                              | 10      | 2.7 MHz                      |

1. Calculation formula for USB-2B (2232H FTDI USB host chip):

$$\text{Frequency} = 60 \text{ MHz} / (1 + \text{ClockDivider}) * 2$$

**Table 17: USB-2B (2232D FTDI USB host chip)**

| Divider | Clock Frequency <sup>2</sup> | Divider | Clock Frequency <sup>2</sup> |
|---------|------------------------------|---------|------------------------------|
| 0       | 6 MHz                        | 5       | 1 MHz                        |
| 1       | 3 MHz (default)              | 6       | 0.8 MHz                      |
| 2       | 2 MHz                        | 7       | 0.7 MHz                      |
| 3       | 1.5 MHz                      | 8       | 0.65 MHz                     |
| 4       | 1.2 MHz                      | 9       | 0.6 MHz                      |
|         |                              | 10      | 0.5 MHz                      |

2. Calculation formula for USB-2B (2232D FTDI USB host chip):

$$\text{Frequency} = 12 \text{ MHz} / (1 + \text{ClockDivider}) * 2$$

**Table 18: USB-2A**

| Divider | Low Pulse Width delay <sup>3</sup> | Divider | Low Pulse Width delay <sup>3</sup> |
|---------|------------------------------------|---------|------------------------------------|
| 0       | NA                                 | 5       | 5x                                 |
| 1       | 1x                                 | 6       | 6x                                 |
| 2       | 2x                                 | 7       | 7x                                 |
| 3       | 3x                                 | 8       | 8x                                 |
| 4       | 4x                                 | 9       | 9x                                 |
|         |                                    | 10      | 10x                                |

3. The USB-2A frequency is fixed at 1.5 MHz, and the Parallel Port frequency is fixed at 500 kHz.

## Running Various Utilities from the Command Line

The command line utilities described in this section are not commonly used by command line users, but you often see them in the auto-make log when you run design processes in the Radiant software environment. Click the links below for details.

- ▶ [Synpwrap](#)
- ▶ [IP Generation](#)

- ▶ [IP Packager](#)
- ▶ [ECO Editor](#)
- ▶ [Standalone Timing Analyzer](#)

### Note

For information on commonly-used FPGA command line tools, see [Command Line Basics](#).

## Synpwrap

The **synpwrap** command line utility (wrapper) is used to manage Synplicity Synplify and Synplify Pro synthesis programs from the Radiant software environment processes: **Synplify Synthesize Verilog File** or **Synplify Synthesize VHDL File**.

The **synpwrap** utility can also be run from the command line to support a batch interface. For details on Synplify see the Radiant Software Help. The **synpwrap** program drives **synplify\_pro** programs with a Tcl script file containing the synthesis options and file list.

### Note

This section supersedes the “Process Optimization and Automation” section of the *Synplicity Synplify and Synplify Pro for Lattice User Guide*.

This section illustrates the use of the **synpwrap** program to run Synplify Pro for Lattice synthesis scripts from the command line. For more information on synthesis automation of Synplify Pro, see the “User Batch Mode” section of the *Synplicity Synplify and Synplify Pro for Lattice User Guide*.

If you use Synplify Pro, the Lattice OEM license requires that the command line executables **synplify\_pro** be run by the Lattice “wrapper” program, **synpwrap**.

### Command Line Syntax

```
synpwrap [-nolog] [-int <command_file>] [-gui] [-int <prj_file>] -prj
<project_file> [-notoem] [-notpro] [-options <arguments>]
```

**Table 19: SYNPPWRAP Command Line Options**

| Option                      | Description                                                                                                                                  |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>-options</b> <arguments> | Passes all arguments to Synplify/Synplify Pro. Ignores all other options except -notOEM and -notPro. It must be at the end of other options. |
| <b>-gui</b>                 | Invokes the Synplify GUI instead of batch running.                                                                                           |

**Table 19: SYNPPWRAP Command Line Options**

| Option                           | Description                                                                                                 |
|----------------------------------|-------------------------------------------------------------------------------------------------------------|
| <b>-notOEM</b>                   | Does not use the Lattice OEM version of Synplify/Synplify Pro.                                              |
| <b>-notPro</b>                   | Does not use Synplify Pro. It will automatically use Synplify if SynplifyPro does not exist.                |
| <b>-int &lt;prj_file&gt;</b>     | Same as the -gui and -prj <file> options. Invokes Synplify GUI with project per command file.               |
| <b>-nolog</b>                    | Does not print out the log file after the process is finished if there is no error (batch mode only).       |
| <b>-prj &lt;project_file&gt;</b> | Uses Synplify .prj file instead of the command file (recommended).                                          |
| <b>-fg</b>                       | Forces to run in foreground mode, and waits for Synplify to quit. Only available with the -options command. |
| <b>-h -help</b>                  | Prints this usage. Same as running the process without any arguments.                                       |

### Example

Below shows a synpwrap command line example.

```
synpwrap -gui -prj C:/lsc/radiant/2023.2/sample/sample.prj
```

## IP Generation

The IP generation command allows you to generate or regenerate any IP in the design.

To see all argument/syntax for the “ipgen” command and their description, use the **--help/-h** syntax in the TCL console.

### Command Line Syntax

```
ipgen.EXE [-h] [-o OUTPUT_DIR] [-proj_dir PROJ_DIR] [-ip  
IP_MODULE_DIR] [-cfg IP_CONFIG_FILE] [-skip_uniquify  
SKIP_UNIQUIFY_HDL] [-cfg_value IP_CONFIG_VALUE] [-name  
IP_INSTANCE_NAME] [-platform IPGEN_PLATFORM] [-vlnv IPGEN_VLNV]
```

| <code>-skip_uniquify</code><br><code>SKIP_UNIQUIFY_HDL</code>   | Controls whether uniquified HDL files are True or False.                                                     |
| <code>-cfg_value</code><br><code>IP_CONFIG_VALUE</code>         | IP configuration value: 'id:value; id1:value1'                                                               |
| <code>-name</code><br><code>IP_INSTANCE_NAME</code>             | Name of the IP instance package.                                                                             |
| <code>-platform</code><br><code>IPGEN_PLATFORM</code>           | Name of ipgen's runtime environment: Radiant or Propel. The default is Radiant.                              |
| <code>-vlnv IPGEN_VLNV</code>                                   | Location of the IP configuration file by vendor library name and version.                                    |
| <code>-rtl_library_path</code><br><code>RTL_LIBRARY_PATH</code> | The RTL library path for IP.                                                                                 |
| <code>-a ARCHITECTURE</code>                                    | Target architecture name.                                                                                    |
| <code>-p DEVICE</code>                                          | Target device name.                                                                                          |
| <code>-t PACKAGE</code>                                         | Target package name.                                                                                         |
| <code>-sp PERFORMANCE</code>                                    | Target performance name.                                                                                     |
| <code>-f FAMILY</code>                                          | Target family name.                                                                                          |
| <code>-op OPERATION</code>                                      | Specify the device operation.                                                                                |

#### Hard IP (Module/IP on Local) ID and Value for `-cfg_value`:

The options for IP configuration using the `-cfg_value <ID:value>` syntax can be found in the metadata.xml file located at:

```
<radiant_install_path>\ip\<IP_name>\metadata.xml.
```

Oscillator IP location of Nexus devices:  
Linux: /home/lsc/radiant/2024.1/ip/lifcl/osc/metadata.xml  
Windows: C:/lsc/radiant/2024.1/ip/lifcl/osc/metadata.xml

Diagram my\_osc

Configure my\_osc

| Property                | Value    |
|-------------------------|----------|
| HFCLK Enable            | ENABLED  |
| HFCLK Frequency (MHz)   | 225.0    |
| LFCLK Enable            | ENABLED  |
| LFCLK Frequency (MHz)   | 10       |
| SEDCCLK Enable          | DISABLED |
| SEDCCLK Divider         | 1        |
| SEDCCLK Frequency (MHz) | 225.0    |
| CFGMMCLK Enable         | DISABLED |

```

```

ID: Value

### Soft IP (IP on Server) ID and Value for `-cfg_value`:

The options for IP configuration using the `-cfg_value <ID:value>` syntax can also be found in the metadata.xml file of each IP.

The only difference between Hard IPs and Soft IPs is the location from which Soft IPs are downloaded and installed.

To find the directory where Radiant installs all downloaded IPs:

1. Open Radiant software.
2. Click **Tools > Options**.
3. In the General section, click the **Directories** tab. You will be able to see the IP install path.

### Generating a New Hard IP

This section provides an example of how to create a new SDR (Hard IP) for the LFMXO5 device.

```
ipgen -o /home/centos/Temp_Proj/Radiant/SDR_IPgen/sdr_rx_new -ip /
home/centos/Iscc/radiant/2024.1/ip/lifcl/sdr -name sdr_rx_new -cfg "/
home/centos/Temp_Proj/Radiant/SDR_IPgen/sdr_rx/sdr_rx.cfg" -
cfg_value IO_TYPE:LVTTL33 -a LFMXO5 -p LFMXO5-100T -t BBG400 -sp
9_High-Performance_1.0V -op COM
```

- ▶ **-o** – Directory where IP files are generated.
- ▶ **-ip** – Points out where the IP package is. All foundation IP can be found inside the Radiant installation path: (<radiant install path>/Iscc/radiant/2024.1/ip/lifcl/sdr).
- ▶ **-name** – Name of your IP instance.
- ▶ **-cfg (optional)** – Contains all the parameter configuration of the IP. If you do not specify the cfg location, the IP configuration will be default.
- ▶ **-cfg\_value** – IP configuration value <ID:value>
- ▶ **-a** – Device Architecture
- ▶ **-p** – Device Name
- ▶ **-t** – Device Package
- ▶ **-sp** – Device Performance
- ▶ **-op** – Operating Condition (Automotive = AUTO, Commercial = COM, Industrial = IND)

### Generating a New Soft IP

This section shows an example of how to generate a new SPI Flash Controller IP (Soft IP) instance for the LIFCL device.

```
ipgen -o C:/Users/Desktop/Temp_Proj/Radiant/SPI_Flash_Controller/
SFC_IP -ip C:/lsc/radiant/IP/
latticesemi.com_ip_spi_flash_controller_1.5.0 -name SFC_v1 -cfg_value
PAGE_PROGRAM_SIZE:512 -a LIFCL -p LIFCL-40 -t QFN72 -sp 7_High-
Performance_1.0V -op COM
```

- ▶ **-o** – Directory where all your IP files are generated.
- ▶ **-ip** – Points out where the IP is downloaded and installed.
- ▶ **-name** – Name of your IP instance
- ▶ **-cfg\_value** – IP configuration value <ID:value>
- ▶ **-a** – Device Architecture
- ▶ **-p** – Device Name
- ▶ **-t** – Device Package
- ▶ **-sp** – Device Performance
- ▶ **-op** – Operating Condition (Automotive = AUTO, Commercial = COM, Industrial = IND)

### Regenerating an Existing IP

To update the configuration of an IP, use the **-cfg\_value** syntax. **-cfg\_value** is used to modify the existing options for specific IP setting ID.

### Example of how to change or update the IO\_TYPE setting for the SDR IP:

**Option 1:** Open the CFG file using a text editor and update the parameter value. Then, run the **ipgen** command to regenerate the IP. Ensure that the ipgen syntax correctly references the location of the existing IP.

**Option 2:** Modify the value using the **cfg\_value** syntax.

```
ipgen -o /home/centos/Temp_Proj/Radiant/SDR_IPgen/sdr_rx_new -ip /
home/centos/lsc/radiant/2024.1/ip/lifcl/sdr -name sdr_rx_new -cfg "/
home/centos/Temp_Proj/Radiant/SDR_IPgen/sdr_rx/cfg" -
cfg_value IO_TYPE:LVDS -a LFMXO5 -p LFMXO5-100T -t BBG400 -sp
9_HighPerformance_1.0V -op COM
```

## Using the Radiant TCL Console to Run ipgen:

You can execute the **ipgen** command either through the TCL console within Radiant or by launching the stand-alone Radiant TCL console.

**On Windows:** Run `pnmainc.exe` inside `<radiant install path>/lsc/radiant/2024.1/bin/win64/`.

**On Linux:** Run the Radiant stand-alone TCL console in your terminal:  
`<radiant install path>/lsc/radiant/2024.1/bin/linux64/radiantc.`

```
centos@centos8 ~]$ /home/centos/lsc/radiant/2023.1/bin/linux64/radiantc

Radiant stand-alone  
TCL console

Successful IP  
Generation

You can pass a script containing the IP generation command directly to the Radiant stand-alone TCL console without launching the console manually. See the example below.

Linux Example:

```
centos@centos8:~/test_ip_script
File Edit View Search Terminal Help
[centos@centos8 ~]$ /home/centos/lsc/radiant/2023.1/bin/linux64/radiantc script.tcl
[centos@centos8 ~]$ cat script.tcl
exec ipgen -o /home/centos/test_ip_script -ip /home/centos/lsc/radiant/2023.1/ip/lifcl/sdr -name sdr_rx_new -a LFMX05 -p LFMX05-100T -t BBG400 -sp 9 High-Performance 1.0V
[centos@centos8 ~]$ cd test_ip_script
[centos@centos8 test_ip_script]$ ls
component.xml  design.xml  rtl          sdr_rx_new.ipx
constraints    misc        sdr_rx_new.cfg  testbench
[centos@centos8 test_ip_script]$
```

Invoke Radiant TCL console  
and run the TCL script.

Content of the script.tcl. If you  
will use ipgen in a script, add  
the "exec" command.

Successful IP creation

If **ipgen** is used in a script, make sure to include the **exec** command before **ipgen**.

## Using CSH Linux Terminal to Invoke ipgen:

To run the **ipgen** command from a CSH terminal in Linux, you must first manually set up the required environment variables. Refer to the example below.

```

centos@centos8 ~
File Edit View Search Terminal Help
[centos@centos8 ~]$ csh
[centos@centos8 ~]$ setenv FOUNDRY /home/centos/lsc/radiant/2023.1/ispfpga
[centos@centos8 ~]$ setenv PATH /home/centos/lsc/radiant/2023.1/bin/lin64:$FOUNDRY/bin/lin64
[centos@centos8 ~]$ setenv LD_LIBRARY_PATH /home/centos/lsc/radiant/2023.1/bin/lin64:$FOUNDRY/bin/lin64:/home/centos/lsc/radiant/2023.1/bin/lin64/toolapps
[centos@centos8 ~]$ ipgen -h
usage: ipgen [-h] [-o OUTPUT_DIR] [-proj_dir PROJ_DIR] [-ip IP_MODULE_DIR]
             [-cfg IP_CONFIG_FILE] [-skip_uniquify SKIP_UNIQUIFY_HDL]
             [-cfg_value IP_CONFIG_VALUE] [-name IP_INSTANCE_NAME]
             [-platform IPGEN_PLATFORM] [-vlnv IPGEN_VLNV]
             [-rtl_library_path RTL_LIBRARY_PATH] [-a ARCHITECTURE]
             [-p DEVICE] [-t PACKAGE] [-sp PERFORMANCE] [-f FAMILY]

Lattice soft IP generation engine.

optional arguments:
  -h, --help            show this help message and exit
  -o OUTPUT_DIR          Location to generate IP instance package. (default is
                        current directory)
  -proj_dir PROJ_DIR     Location of Radiant Project, which owns generated IP
                        instance package. (default is current directory)
  -ip IP_MODULE_DIR      Location of IP module package
  -cfg IP_CONFIG_FILE    Location of IP configuration file

```

Set the FOUNDRY, PATH, and LD\_LIBRARY\_PATH

Check if "ipgen" is successfully recognized by invoking the help verbose

### Example of ipgen in CSH terminal:

```

centos@centos8 ~
File Edit View Search Terminal Help
[centos@centos8 ~]$ setenv FOUNDRY /home/centos/lsc/radiant/2023.1/ispfpga
[centos@centos8 ~]$ setenv PATH /home/centos/lsc/radiant/2023.1/bin/lin64:$FOUNDRY/bin/lin64
[centos@centos8 ~]$ setenv LD_LIBRARY_PATH /home/centos/lsc/radiant/2023.1/bin/lin64:$FOUNDRY/bin/lin64:/home/centos/lsc/radiant/2023.1/bin/lin64/toolapps
[centos@centos8 ~]$ ipgen -o /home/centos/test_ip_csh -ip /home/centos/lsc/radiant/2023.1/ip/lifcl/sdr -name sdr_rx_new -a LFMX05 -p LFMX05-100T -t BBG400 -sp 9_High-Performance 1.0V
WARNING: missing driver HDL files.
Writing /home/centos/test_ip_csh/rtl/sdr_rx_new.bb.v
Writing /home/centos/test_ip_csh/sdr_rx_new.cfg
Writing /home/centos/test_ip_csh/misc/sdr_rx_new.templ.v
Writing /home/centos/test_ip_csh/misc/sdr_rx_new.templ.vhd
Writing /home/centos/test_ip_csh/rtl/sdr_rx_new.v
Writing /home/centos/test_ip_csh/constraints/sdr_rx_new.ldc
Writing /home/centos/test_ip_csh/testbench/dut_params.v
Writing /home/centos/test_ip_csh/testbench/dut_inst.v
Writing /home/centos/test_ip_csh/design.xml
Writing /home/centos/test_ip_csh/component.xml
Writing /home/centos/test_ip_csh/sdr_rx_new.ipx
[centos@centos8 ~]$

```

Successful IP generation

### Using BASH Linux Terminal to Invoke ipgen:

To run the **ipgen** command in a bash terminal on Linux, you can set up the environment variables by executing the setup script provided by Radiant.

```

[centos@centos8 ~]$ bash
[centos@centos8 ~]$ export bindir=/home/centos/lsc/radiant/2023.1/bin/linux64
[centos@centos8 ~]$ source $bindir/radiant_env
[centos@centos8 ~]$ ipgen -h
usage: ipgen [-h] [-o OUTPUT_DIR] [-proj_dir PROJ_DIR] [-ip IP_MODULE_DIR]
             [-cfg IP_CONFIG_FILE] [-skip_uniquify SKIP_UNIQUIFY_HDL]
             [-cfg value IP_CONFIG_VALUE] [-name IP_INSTANCE_NAME]
             [-platform IPGEN_PLATFORM] [-vlnv IPGEN_VLNV]
             [-rtl_library_path RTL_LIBRARY_PATH] [-a ARCHITECTURE]
             [-p DEVICE] [-t PACKAGE] [-sp PERFORMANCE] [-f FAMILY]

Lattice soft IP generation engine.

Optional arguments:
-h, --help            show this help message and exit
-o OUTPUT_DIR         Location to generate IP instance package. (default is
                       current directory)
-proj_dir PROJ_DIR    Location of Radiant Project, which owns generated IP
                       instance package. (default is current directory)
-ip IP_MODULE_DIR      Location of IP module package
-cfg IP_CONFIG_FILE    Location of IP configuration file.
-skip_uniquify SKIP_UNIQUIFY_HDL Control whether uniquify hdl files: True/False.
-cfg value IP_CONFIG_VALUE

```

Set "bindir" variable to  
<radiant install path>/bin/linux64  
and invoke the radiant\_env script.

Check if "ipgen" is successfully  
recognized by invoking the help  
verbose.

### Example of ipgen in BASH terminal.

```

centos@centos8:~$ bash
[centos@centos8 ~]$ export bindir=/home/centos/lsc/radiant/2023.1/bin/linux64
[centos@centos8 ~]$ source $bindir/radiant_env
[centos@centos8 ~]$ ipgen -o /home/centos/test_ip -ip /home/centos/

## IP Packager

The IP Packager (ippkg) tool can be run from the command line, allowing IP developers to select files from disks and pack them into one IPK file.

The following describes the process of IP Packager:

- ▶ IP author prepares metadata files, RTL files, HTML files, etc (all files of a Soft IP).
- ▶ IP Packager GUI provides UI for IP author to select files from the disk, and call IP Packaging engine to pack them into an IPK file.
- ▶ IP Packaging engine encrypts RTL files if IEEE P1735-2014 V1 pragmas are specified in RTL source

## Command Line Syntax

**ippkg [-h] (-metadata METADATA\_FILE | -metadata\_files METADATA\_LIST\_NAME) (-rtl RTL\_FILE | -rtl\_files RTL\_LIST\_NAME) [-ref\_rtl REF\_RTL\_FILE] [-encrypt FORCE\_ENCRYPT\_FILE | -encrypt\_files FORCE\_ENCRYPT\_LIST\_NAME] [-plugin PLUGIN\_FILE] [-ldc LDC\_FILE] [-fdc FDC\_FILE] [-testbench TESTBENCH\_FILE | -testbench\_files TESTBENCH\_LIST\_NAME] [-ref\_testbench REF\_TESTBENCH\_FILE] [-driver\_file DRIVER\_FILE | -driver\_files DRIVER\_LIST\_NAME] [-eval\_file EVAL\_FILE | -eval\_files EVAL\_LIST\_NAME] (-help\_file HELP\_FILE | -help\_files HELP\_LIST\_NAME) [-license\_file LICENSE\_FILE] [-o OUTPUT\_ZIP\_FILE] [-key\_file KEY\_FILE]**

**Table 21: IPPKG Command Line Options**

| Option                  | Description                                                                                                                           |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <b>-metadata</b>        | The file name will be fixed to 'metadata.xml'.                                                                                        |
| <b>-metadata_files</b>  | Location of the file which stores the metadata files. One line is a file path in specified file. Must have a file named metadata.xml. |
| <b>-rtl</b>             | Specify the IP RTL file.                                                                                                              |
| <b>-rtl_files</b>       | One line is a file path in specified file.                                                                                            |
| <b>-ref_rtl</b>         | Specify the reference IP RTL file.                                                                                                    |
| <b>-encrypt</b>         | Encrypt the whole RTL files.                                                                                                          |
| <b>-encrypt_files</b>   | One line is a file path in specified file.                                                                                            |
| <b>-plugin</b>          | The file name will be fixed to 'plugin.py'.                                                                                           |
| <b>-ldc</b>             | Specify the LDC file.                                                                                                                 |
| <b>-fdc</b>             | Specify the FDC file.                                                                                                                 |
| <b>-testbench</b>       | Specify the testbench file.                                                                                                           |
| <b>-testbench_files</b> | One line is a file path in specified file.                                                                                            |
| <b>-ref_testbench</b>   | Specify the reference testbench file.                                                                                                 |
| <b>-driver</b>          | Specify the driver file.                                                                                                              |
| <b>-driver_files</b>    | One line is a file path in specified file.                                                                                            |
| <b>-eval</b>            | Specify the IP evaluation file.                                                                                                       |
| <b>-eval_files</b>      | One line is a file path in specified file.                                                                                            |
| <b>-help_file</b>       | Specify the help file, must be <path>/introduction.html.                                                                              |
| <b>-help_files</b>      | One line is a file path in specified file.                                                                                            |
| <b>-license_file</b>    | Specify the license file.                                                                                                             |

**Table 21: IPPKG Command Line Options**

| Option           | Description                                    |
|------------------|------------------------------------------------|
| <b>-o</b>        | Specify the output zip file.                   |
| <b>-key_file</b> | Specify the key file to encrypt the RTL files. |

**Example**

The following is an ippkg command line example:

```
ippkg -metadata c:/test/test.xml -rtl_files c:/test/rtl_list -
help_file c:/test/introduction.html
```

**See Also**

- ▶ [Command Line Data Flow](#)

**ECO Editor**

The ECO Editor tool can be run from the command line.

ECO Editor is also able to dump the ECO Tcl commands which user performed in GUI view without saving any UDB file.

In the meanwhile, we will have one non-GUI ECO engine tool, which accepts the dumped Tcl script file with a UDB file and outputs a new UDB file.

User can set 'Place & Route design' milestone post-script by Tcl command `prj_set_postscript par <eco.tcl>`, then Radiant flow runs the ECO Tcl script automatically after running place & route.

You can bypass the ecoc engine by manually loading the UDB file using the `des_read_udb` command. This method is only supported in Tcl scripting mode.

**Command Line Syntax**

```
ecoc [-s <script_file>] [-o <output.udb>] <input.udb>]
```

This method is only supported in TCL scripting mode.

**Table 22: ECO Editor Command Line Options**

| Option                   | Description          |
|--------------------------|----------------------|
| <b>-s</b>                | ECO Tcl script file. |
| <b>-o</b>                | Output UDB file.     |
| <b>&lt;input.udb&gt;</b> | Input UDB file.      |

**Example**

The following is an ecoc command line example:

```
ecoc -s mem.tcl ebr_test_impl_1.ldb
```

#### See Also

- ▶ [Command Line Program Overview](#)
- ▶ [Command Line Data Flow](#)

## Standalone Timing Analyzer

The Standalone Timing Analyzer can be run from the command line.

#### Command Line Syntax

**tavmain** <ldb file name> [<pdic file name>]

#### Example

The following is a tavmain command line example:

```
tavmain design.ldb design.pdic
```

#### See Also

- ▶ [Command Line Program Overview](#)
- ▶ [Command Line Data Flow](#)

## Using Command Files

This section describes how to use command files.

#### Creating Command Files

The command file is an ASCII file containing command arguments, comments, and input/output file names. You can use any text editing tool to create or edit a command file, for example, **vi**, **emacs**, **Notepad**, or **Wordpad**.

Here are some guidelines when you should observe when creating command files:

- ▶ Arguments (executables and options) are separated by space and can be spread across one or more lines within the file.
- ▶ Place new lines or tabs anywhere white space would otherwise be allowed on the Linux or DOS command line.
- ▶ Place all arguments on the same line, or one argument per line, or any combination of the two.

- ▶ There is no line length limitation within the file.
- ▶ All carriage returns and other non-printable characters are treated as space and ignored.
- ▶ Comments should be preceded with a # (pound sign) and go to the end of the line.

### Command File Example

This is an example of a command file:

```
#command line options for par for design mine.ldb
-a -n 10
-w
-l 5
-s 2 #will save the two best results
/home/users/jimbo/b/designs/mine.ldb
#output design name
/home/users/jimbo/b/designs/output.dir
#use timing constraint file
/home/users/jimbo/b/designs/mine.prf
```

### Using the Command File

#### The -f Option

Use the **-f** option to execute a command file from any command line tool. The **-f** option allows you to specify the name of a command file that stores and then executes commonly used or extensive command arguments for a given FPGA command line executable tool. You can then execute these arguments at any time by entering the Linux or DOS command line followed by the name of the file containing the arguments. This can be useful if you frequently execute the same arguments each time you perform the command, or if the command line becomes too long. This is the recommended way to get around the DOS command line length limitation of 127 characters. (Equivalent to specifying a shell Options file.)

The **-f** indicates fast startup, which is performed by not reading or executing the commands in your `.cshrc` | `.kshrc` | `.shrc` (C-shell, Korn-shell, Bourne-shell) file. This file typically contains your path information, your environment variable settings, and your aliases. By default, the system executes the commands in this file every time you start a shell. The **-f** option overrides this process, discarding the 'set' variables and aliases you do not need, making the process much faster. In the event you do need a few of them, you can add them to the command file script itself.

### Command File Usage Examples

You can use the command file in two ways:

- ▶ To supply all of the command arguments as in this example:

```
par -f <command_file>
```

where:

<command\_file> is the name of the file containing the command line arguments.

- ▶ To insert certain command line arguments within the command line as in the following example:

```
par -i 33 -f placeoptions -s 4 -f routeoptions design_i.udb design_o.udb
```

where:

**placeoptions** is the name of a file containing placement command arguments.

**routeoptions** is the name of a file containing routing command arguments.

## Using Command Line Shell Scripts

This topic discusses the use of shell scripts to automate either parts of your design flow or entire design flows. It also provides some examples of what you can do with scripts. These scripts are Linux-based; however, it is also possible to create similar scripts called batch files for PC but syntax will vary in the DOS environment.

### Creating Shell Scripts

A Linux shell script is an ASCII file containing commands targeted to a particular shell that interprets and executes the commands in the file. For example, you could target Bourne Shell (**sh**), C-Shell (**csh**), or Korn Shell (**ksh**). These files also can contain comment lines that describe part of the script which then are ignored by the shell. You can use any text editing tool to create or edit a shell script, for example, **vi** or **emacs**.

Here are some guidelines when you should observe when creating shell scripts:

- ▶ It is recommended that all shell scripts with “#!” followed by the path and name of the target shell on the first line, for example, `#!/bin/ksh`. This indicates the shell to be used to interpret the script.
- ▶ It is recommended to specify a search path because oftentimes a script will fail to execute for users that have a different or incomplete search path. For example:  

```
PATH=/home/usr/lsmith:/usr/bin:/bin; export PATH
```
- ▶ Arguments (executables and options) are separated by space and can be spread across one or more lines within the file.
- ▶ Place new lines or tabs anywhere white space would otherwise be allowed on the Linux command line.
- ▶ Place all arguments on the same line, or one argument per line, or any combination of the two.
- ▶ There is no line length limitation within the file.

- ▶ All carriage returns and other non-printable characters are treated as space and ignored.
- ▶ Comments are preceded by a # (pound sign) and can start anywhere on a line and continue until the end of the line.
- ▶ It is recommended to add exit status to your script, but this is not required.

```
# Does global timing meet acceptable requirement range?
if [ $timing -lt 5 -o $timing -gt 10 ]; then
    echo 1>&2 Timing \"$timing\" out of range
    exit 127
fi
etc...
# Completed, Exit OK
exit 0
```

### Advantages of Using Shell Scripts

Using shell scripts can be advantageous in terms of saving time for tasks that are often used, in reducing memory usage, giving you more control over how the FPGA design flow is run, and in some cases, improving performance.

### Scripting with DOS

Scripts for the PC are referred to as batch files in the DOS environment and the common practice is to ascribe a .bat file extension to these files. Just like Linux shell scripts, batch files are interpreted as a sequence of commands and executed. The COMMAND.COM or CMD.EXE (depending on OS) program executes these commands on a PC. Batch file commands and operators vary from their Linux counterparts. So, if you wish to convert a shell script to a DOS batch file or vice-versa, we suggest you find a good general reference that shows command syntax equivalents of both operating systems.

### Examples

The following example shows running design “counter” on below device package

Architecture: iCE40UP

Device: iCE40UP3K

Package: UWG30

Performance: Worst Case

**Command 1: logic synthesis**

```
synthesis -f counter_impl1_lattice.synproj
           which the *.synproj contains
-a "iCE40UP"
-p iCE40UP3K
-t UWG30
-sp "Worst Case"
-optimization_goal Area
-bram_utilization 100
-ramstyle Auto
```

```

-romstyle auto
-dsp_utilization 100
-use_dsp 1
-use_carry_chain 1
-carry_chain_length 0
-force_gsr Auto
-resource_sharing 1
-propagate_constants 1
-remove_duplicate_regs 1
-mux_style Auto
-max_fanout 1000
-fsm_encoding_style Auto
-twr_paths 3
-fix_gated_clocks 1
-loop_limit 1950
-use_io_reg auto
-use_io_insertion 1
-resolve_mixed_drivers 0
-sdc "impl1.ldc"
-path "C:/lsc/radiant/1.0/ispfpga/ice40tp/data" "impl1"
-ver "C:/lsc/radiant/1.0/ip/pmi/pmi.v"
-ver "count_attr.v"
-path "."
-top count
-udb "counter_impl1.udb"
-output_hdl "counter_impl1.vm"

```

**Command 2: post synthesis process**

```

postsyn -a iCE40UP -p iCE40UP3K -t UWG30 -sp Worst Case -top -
ldc counter_impl1.ldc -keeprtl -w -o counter_impl1.udb
counter_impl1.vm

```

**Command 3: Mapper**

```

map "counter_impl1_syn.udb" "impl1.pdc" -o "counter_impl1.udb"

```

**Command 4: Placer and router**

```

par -f "counter_impl1.p2t" "counter_impl1_map.udb"
"counter_impl1.udb"

```

**Command 5: Timer**

```

timing -sethld -v 10 -u 10 -endpoints 10 -nperend 1 -html -rpt
"counter_impl1_twr.html" "counter_impl1.udb"

```

**Command 6: back annotation**

```

backanno "counter_impl1.udb" -n Verilog -o
"counter_impl1_vo.vo" -w -neg

```

**Command 7: bitstream generation**

```

bitgen -w "counter_impl1.udb" -f "counter_impl1.t2b"

```

## Tcl Command Reference Guide

The Radiant software supports Tcl (Tool Command Language) scripting and provides extended Radiant software Tcl commands that enable a batch capability for running tools in the Radiant software's graphical/console interface. The command set and the Tcl Console used to run it affords you the speed, flexibility and power to extend the range of useful tasks that the Radiant software tools are already designed to perform.

In addition to describing how to run the Radiant software's Tcl Console, this guide provides you with a reference for Tcl command line usage and syntax for all Radiant software point tools within the graphical user interface so that you can create command scripts, modify commands, or troubleshoot existing scripts.

### About the Radiant Software Tcl Scripting Environment

The Radiant software development software features a powerful script language system. The user interface incorporates a complete Tcl command interpreter. The command interpreter is enhanced further with additional Radiant software-specific support commands. The combination of fundamental Tcl along with the commands specialized for use with the Radiant software allow the entire Radiant software development environment to be manipulated.

Using the command line tools permits you to do the following:

- ▶ Develop a repeatable design environment and design flow that eliminates setup errors that are common in GUI design flows
- ▶ Create test and verification scripts that allow designs to be checked for correct implementation
- ▶ Run jobs on demand automatically without user interaction

The Radiant software command interpreter provides an environment for managing your designs that are more abstract and easier to work with than

using the core Radiant software engines. The Radiant software command interpreter does not prevent use of the underlying transformation tools. You can use either the Tcl commands described in this section or you can use the core engines described in the [Command Line Reference Guide](#).

### Additional References

If you are unfamiliar with the Tcl language you can get help by visiting the Tcl/tk web site at <https://www.tcl.tk>. If you already know how to use Tcl, see the Tcl Manual supplied with this software. For information on command line syntax for running core tools that appear as Radiant software processes, such as synthesis, map, par, backanno, and timing, see the [Command Line Reference Guide](#).

# Launching the Tcl Console

The Radiant software Tcl Console environment is made available for your use in multiple different ways. In order to take full advantage of the FPGA development process afforded by the Radiant software you must gain access to the Radiant Tcl Console user interface.

**On Windows** On Windows, you can interact with the Tcl Console by anyone of the following methods:

- ▶ To launch the Radiant software GUI from the Windows Start menu, choose **Start > Lattice Radiant Software (version\_number) > Radiant Software**.

After the Radiant software loads, you can click on the **Tcl Console** tab. With the **Tcl Console** tab active, you are able to start entering standard syntax TCL commands or the Radiant software-specific support commands.

- ▶ To launch the **Tcl Console** independently from the Radiant software GUI from the Windows Start menu choose **Start > Lattice Radiant Software (version\_number) > Tcl Console**.

A Windows command interpreter will be launched that automatically runs the **Tcl Console**.

- ▶ To run the interpreter from the command line, type the following:

```
c:/lsc/radiant/<version_number>/bin/nt64/radiantc
```

The Radiant **Tcl Console** is now available to run.

- ▶ To run the interpreter from a Windows PowerShell from the Windows Start menu choose **Start > Windows PowerShell > Windows PowerShell (x86)**.

A PowerShell interpreter window will open. At the command line prompt type the following:

```
c:/lsc/radiant/<version_number>/bin/nt64/radiantc
```

The Radiant **Tcl Console** is now available to run.

The Radiant **Tcl Console** also supports passing command line arguments to scripts, allowing you to execute a script with specific parameters directly from the command line. For example, you can run a script with arguments using the following command:

```
% radiantc commands.tcl arg_a arg_b arg_c
```

The Radiant **TCL Console** does not require any special argument handling inside the TCL file.

## Note

The arrangement and location of each of the programs in the Windows Start menu will differ depending on the version of Windows you are running.

---

**On Linux** On Linux operating systems, you can interact with the Tcl Console by one of the following methods:

- ▶ To launch the Radiant software GUI from the command line, type the following:

```
/usr/<user_name>/radiant/<version_number>/bin/lin64/radiant
```

The path provided assumes the default installation directory and that the Radiant software is installed. After the Radiant software loads you can click on the **Tcl Console** tab. With the **Tcl Console** tab active, you are able to start entering standard syntax Tcl commands or the Radiant software specific support commands.

- ▶ To launch the **Tcl Console** independently from the Radiant software GUI from the command line, type the following:

```
/usr/<user_name>/Radiant/<version_number>/bin/lin64/radiantc
```

The path provided assumes the default installation directory and that the Radiant software is installed, and that you have followed the Radiant software for Linux installation procedures. The Radiant **Tcl Console** is now ready to accept your input.

The advantage of running the **Tcl Console** from an independent command interpreter is the ability to directly pass the script you want to run to the Tcl interpreter. Another advantage is that you have full control over the Tk graphical environment, which allows you to create your own user interfaces.

## Running Radiant Tcl

This section describes the following features:

- ▶ How to run Radiant Tcl
- ▶ Using log/tcl files
- ▶ Accessing the Lattice run directory

Tcl supports the following command modes:

- ▶ **GUI Mode (radiant)** – you can use the **radiant** command to launch the GUI mode. Radiant's Tcl Console window is still accessible, however it currently only accepts project commands.
- ▶ **Pure interactive shell mode (radiantc)** – starts a pure interactive shell mode. If a tcl file is specified in the command line, the run is done in batch mode. Both project and non-project commands are supported by radiantc.
- ▶ **Interactive shell/GUI mode (radiantc -gui)** – starts as a shell mode. The **gui\_start** command can be used to launch GUI views. When GUI views are closed, it returns to shell mode.

## Log and Tcl Files

When using radiantc, the log message is automatically stored in the **radiantc.log.<pid>** file, and the tcl commands are kept in the **radiant.tcl.<pid>** file, where the <pid> is the process id for radiantc run. In the case the file “**radiantc.log.<pid>**” does exist, the file will be renamed to “**radiantc.log.<pid>.bak**”. We do the same check for “**radiant.tcl.<pid>**”

The log message from Radiant (GUI) run is still stored in the **automake.log** file as before.

With radiantc mode, you can do following:

- ▶ Use the **RAT\_LOG\_DIR** environment variable to specify the directory where you want to keep the log/tcl files.

If there is no environment variable, the log/tcl directory is set as *C:\Users\<User dir>\AppData\Roaming\LatticeSemi\DiamondNG\tcl* if you are using NT, and the current directory *.I* when using Linux.

- ▶ Specify the run name to be used as the prefix of log/tcl file names.

For example, if you run *radiantc -run mytest*, the log file will be named *mytest.log.<pid>* and the tcl file will be named *mytest.tcl.<pid>*.

## Valid Characters in File Name and Project Path

In file names and project paths, use only the valid characters below. Using unsupported characters result in errors.

- ▶ Alphabet (A - Z; a - z)
- ▶ Number (0 - 9)
- ▶ Underscore ( \_ )
- ▶ Minus ( - )
- ▶ Space ( )

---

### Notes:

1. Brackets [ ] in file names are acceptable in Windows but their use is not recommended.
  2. For Linux, using the following symbols in file names are acceptable but not recommended:
    - ▶ Vertical bar (|)
    - ▶ Backslash (\)
    - ▶ Greater than sign(>)
    - ▶ Question mark (?)
    - ▶ Less than sign (<)
    - ▶ Colon ( : )
    - ▶ Asterisk ( \* )
    - ▶ Quotation mark ( " )
- 

## Lattice Implementation Directory

In non-project flow, the lattice working directory **lattice\_workdir** keeps the intermediate files during the run. The directory is created under your implementation directory.

- ▶ Under *lattice\_workdir*, you can find map, plc, and rte subdirectories which keep the intermediate run results for technology map (map), placement (plc), and routing (rte).
- ▶ For example, if you want to find the placement log file *<file\_name>.par*, you can find it under the *plc* subdirectory.

## Attributes

In Radiant Tcl system, attributes are used for objects, such as system, design, or instance.

For example:

- ▶ *des\_set\_attribute* is used to set design attributes.
- ▶ *des\_list\_attribute* is used to list the current design attributes.

## Understanding Design Flows

Radiant Tcl supports both project and non-project flows.

**In project flow, you can do the following:**

- ▶ Create a new project or load a saved project from an existing project file.
- ▶ You can then add, delete, or list project files (i.e., RTL, constraint, and strategy setting files). During the whole project flow, you can save it into a project (.rdf) file any time.

**For non-project flow:**

- ▶ With two specific commands, Radiant Tcl may start a non-project flow from an existing project flow. The Radiant database (.udb) file can be read as input to begin the non-project flow, after which the design process can continue.

**There are four major differences between project and non-project flows:**

1. The project flow design is saved as disk files instead of being stored in memory. You can use different strategies to create different implementations for the same project. On the other hand, design in non-project flow is kept in memory and can be accessed or changed interactively using commands.

For example, you can use timing analysis commands to report timing results at different paths.

2. In project flow, you need to add project files. The time stamps of these files are checked for any new commands. If there are any changes in the project files, the flow will ask you to rerun the design at the right stages.

For example, if you change a post-synthesis constraint (.pdc) file, you need to rerun technology mapping. However, if you change any RTL files or the pre-synthesis constraint files, you need to rerun logic synthesis.

In non-project flow, the input file is a Radiant database (.udb) file, and the time stamp of such file is not checked during the design flow.

3. You cannot skip any design stage from the run commands in non-project flow.

For example, you need to run placement (plc\_run) before you run routing (rte\_run) in non-project flow. However, you can use one of the prj\_run

commands ([prj\\_run\\_bitstream](#), [prj\\_run\\_map](#), [prj\\_run\\_par](#), [prj\\_run\\_synthesis](#)) in project flow to run the design flow automatically from the current stage to the target stage.

4. Implementation strategies are used in project flow and implementation options in non-project flow.

Implementation strategy is a subset of implementation options.

## Using Implementation Strategies and Options

In Radiant, **strategies** are used to specify how to run specific tasks, such as logic synthesis, technology mapping, and placement and routing.

**To see the list of strategies in Radiant:**

- ▶ In the toolbar, click **Project > Active Strategy**.

The list of strategies appear.

- ▶ For instance, if you click **Place & Route Design Settings** from the list, it redirects to the Place & Route Design section in the **Strategies** dialog box.

In TCL, **options** are used to specify how to run specific tasks.

- ▶ For example, you can use **par\_list\_option** after a design has been loaded to check the current placement and routing option setting, and use **par\_set\_option** to change them:

```
% par_list_option
PAR Options:
    command_line_options                :
    disable_auto_hold_timing_correction :
false
    disable_timing_driven                :
false
    multi_tasking_node_list               :
    number_of_host_machine_cores         : 1
    placement_iteration_start_point       : 1
    placement_iterations                  : 1
    placement_save_best_run               : 1
    prioritize_hold_correction_over_setup_performance :
false
    run_placement_only                   :
false
    set_speed_grade_for_hold_optimization : m
    set_speed_grade_for_setup_optimization :
default
    stop_once_timing_is_met              :
false
```

**Strategy and Option Guidelines:**

1. Both strategy and option are device-dependent. You can only change them after a device is selected.
2. You do not need to specify all options in the Radiant Strategy Settings. However, all strategies used in Radiant must be converted to options with the following rules:
  - ▶ If you are using options, change the space ( ) used in strategy to an underscore ( \_ ) to separate words.
  - ▶ In strategy, each word is capitalized. You need to change them to the lower case format if you are using options.
  - ▶ For example:
    - ▶ Strategy uses the following format: **Disable Auto Hold Timing Correction**
    - ▶ Option uses the following format: **disable\_auto\_hold\_timing\_correction**

## Running Project Flow

Running the project flow in Radiant Tcl is the same as the current process. You can use the Radiant software tools to add project files, run the design flow, and output specific timing reports at different design stages.

Most *prj\_<command\_name>* commands are designed for project flow run except **prj\_open\_milestone**. This command is used to switch from project flow to non-project flow.

### prj\_open\_milestone

Commands to open project milestone netlist files.

**Syntax**

```
prj_open_milestone -postsyn | -postmap | -postpar
```

**Arguments**

- ▶ **-postsyn**: Open post-syn logical netlist (optional).
- ▶ **-postmap**: Open post-map physical netlist (optional).
- ▶ **-postpar**: Open post-par physical netlist (optional). Option '-postsyn' '-postmap' and '-postpar' are mutually exclusive.

**Example**

```
prj_open_milestone -postsyn
prj_open_milestone -postmap
prj_open_milestone -postpar
```

**See Also**

- ▶ [“Running Project Flow” on page 1773](#)

## Running Non-Project Flow

You must load the design from a disk file in order to start a non-project flow. For instance, the following commands load a *mapped.ldb* file into memory, report the current design, and run placement.

```
des_read_ldb mydb_map.ldb
des_report
plc_run
```

## Switching From Project Flow to Non-Project Flow

In project flow, you can use **prj\_open\_milestone** to open the run result at a given design stage and switch to non-project flow.

For instance, you can see the **postsyn** run result after opening the *mydb\_syn.rdf* project by using the commands listed below.

The design is currently in memory, and you can report and save it as a Radiant database (.ldb) file.

```
prj_open mydb_syn.rdf
prj_open_milestone -postsyn
des_report
des_write_ldb -w mydb_syn.ldb
```

Using **syn\_run** instead of **prj\_run\_synthesis** for logic synthesis is another way to transition to a non-project flow from a project flow.

- ▶ When **syn\_run** is used, the tool will first execute logical synthesis using the designated vendor tool before loading the post-synthesis design into memory.
- ▶ After that, the flow switches to non-project flow, and you can use non-project commands to complete the rest of the design process.

```
prj_create -name mytest -dev "LIFCL-40-8BG400C" -performance
"8_High-Performance_1.0V" -impl impl_prj_flow -impl_dir
impl_prj_flow -synthesis synplify
prj_add_source ./source/001_register_simple.v
prj_add_source ./others/constraints.sdc
prj_add_source ./others/register_simple1.sty
syn_run
des_report
des_write_ldb -w mydb_syn.ldb
```

With one of the two methods described above, you can change from project flow to non-project flow. Once the design is in memory (i.e., in non-project flow mode), it is not advised to use project commands.

## Running Milestone Results in Non-Project Flow

In non-project flow, the current design is stored in memory, unlike in project flow which keeps previous designs at different milestones. To rerun a previous step due to constraint or option changes, you need to reload the previous milestone result and make a change, then rerun the command.

### Note

---

Milestone refers to processing tasks, which include synthesizing, mapping, placing, and routing a design.

---

To rerun *par\_run* with new *par* options, you need to do the following:

```
% par_run
% des_write_udb -w mydb_par.ldb
% des_reload_milestone -postmap <your_mapped_ldb>
% par_set_option (set your par run option)
% par_run
```

To add a new constraint as a post-synthesis constraint, reload the post-syn milestone as the constraints need to be processed through technology mapping.

```
% par_run
% des_write_udb -w mydb_par.ldb
% des_reload_milestone -postsyn <your_synthesized_ldb>
% ldc_set_location (set your constraint)
% map_run
% par_run
```

To modify timing constraints for logical synthesis, change your constraint file and restart the process from the beginning.

## Opening GUI in Non-Project Flow

In order to open Radiant GUI views in non-project flow, you must run **radiantc** with **-gui** option to enable the linking of the GUI libraries during the run. You can open a **post-par udb** and use **gui\_start** command to open GUI views.

```
>radiantc -gui
% des_read_udb <your_post_par.udb>
% gui_start
```

Certain GUI views require a post-synthesis netlist as the netlist view, which can be added by incrementally reloading the post-synthesis udb.

```
>radiantc -gui
% des_read_udb <your_post_par.udb>
% des_reload_milestone -inc -postsyn <your_synthesized_udb>
% gui_start
```

## Design Flow Examples

### 1. Running Pure-Project Flow

Tcl commands for pure-project run is shown in this use-case. To run a pure-project, add Register Transfer Level (RTL) files, constraint files then run the project using one of the `prj_run` commands ([prj\\_run\\_bitstream](#), [prj\\_run\\_map](#), [prj\\_run\\_par](#), [prj\\_run\\_synthesis](#)) and save the project files at different stages.

#### Note

Pure-project design flow is saved as disk file and not kept in memory. As a result, you cannot run any non-project commands in a project flow. For further information, refer to [Opening a Post-Synthesis Milestone](#).

Open your console and type the following commands to create, add, run and exit the program:

- ▶ To create a project, use `prj_create` command followed by choosing the right device and synthesis tool name:

```
prj_create -name mytest -dev "LIFCL-40-8BG400C" -
performance "8_High-Performance_1.0V" -impl impl_prj_flow
-impl_dir impl_prj_flow -synthesis synplify
```

- ▶ To add project files, use `prj_add_source` command followed by the path of the file you want to add:

```
prj_add_source ./source/001_register_simple.v
prj_add_source ./others/constraints.sdc
prj_add_source ./others/register_simple1.sty
```

- ▶ To save an updated project file, use `prj_save` command:

```
prj_save mydb_syn.rdf
prj_save new_test.rdf
```

```
prj_save mydb_map.rdf
prj_save mydb_par.rdf
```

- ▶ To run synthesis project files, use the [prj\\_run\\_synthesis](#) command.

```
prj_run_synthesis
```

- ▶ To end the program, quit the command to end the flow:

```
quit
```

## 2. Creating Project Files

This section illustrates how to create project files, add Register Transfer Level (RTL) file, and constraint files.

- ▶ To create a project, use `prj_create` command followed by choosing the right device and synthesis tool name:

```
prj_create -name mytest -dev "LIFCL-40-8BG400C" -
performance "8_High-Performance_1.0V" -impl impl_prj_flow
-impl_dir impl_prj_flow -synthesis synplify
```

- ▶ To add project files, use `prj_add_source` command followed by the file directory path you want to add:

```
prj_add_source ./source/001_register_simple.v
prj_add_source ./others/constraints.sdc
prj_add_source ./others/register_simple1.sty
```

- ▶ To switch from project flow to non-project flow, use the **syn\_run** command:

```
syn_run
```

Use **syn\_run** instead of **prj\_run\_synthesis** to change from project flow to non-project flow. After execution, the design is in memory and you can continue the rest of the flow with non-project commands.

### Note

It is not recommended to run the flow with any of the `prj_run` commands ([prj\\_run\\_synthesis](#), [prj\\_run\\_map](#), [prj\\_run\\_par](#), [prj\\_run\\_bitstream](#)) once switched to non-project flow.

- ▶ To run the design information, use `des_report` command:

```
des_report
```

- ▶ To run the map tool, use `map_run` command, followed by `des_write_ufdb -w` command to save the current design:

```
map_run
des_write_ufdb -w mydb_map.ufdb
```

- ▶ To run the placement tool and show the report placement information, use `plc_run` and `plc_report` commands followed by `des_write_udb -w` command to save the current design:

```
plc_run
plc_report
des_write_udb -w mydb_plc.udb
```

- ▶ To run the routing tool and show the routing result, use `rte_run` and `rte_report` commands followed by `des_write_udb -w` command to save the current design:

```
rte_run
rte_report
des_write_udb -w mydb_rte.udb
```

- ▶ To view the detailed report or summary timing, use the following command:

```
sta_report_timing -summary
```

- ▶ To generate bitsream file, use `bit_generate` command followed by `-w` command to force to overwrite the existing file:

```
bit_generate -w mydb_bit
```

- ▶ To end the program, quit the command to end the flow:

```
quit
```

### 3. Reading Post-Synthesis Design

This section shows you how to read in a design database and continue the design flow.

- ▶ To read the post-synthesis database, use `des_read_udb` command followed by the database file name. To view the report design information, use `des_report` command:

```
des_read_udb mydb_syn.udb
des_report
```

- ▶ To set design attributes, use `des_set_attribute` command followed by `-impl_dir` to implement name:

```
des_set_attribute -impl_dir impl_rdb_syn
```

- ▶ To run the map tool and to write the design as `.udb` file, use `map_run` command followed by `des_write_udb` and `overwrite` to save using `-w` command to completely run the design:

```
map_run
des_write_udb -w myrdbsyn_map.udb
```

- ▶ To run the placement tool and show the report placement information, use `plc_run` command and `plc_report` command followed by `des_write_udb -w` command to save the current design:

```
plc_run
plc_report
des_write_udb -w myrdbsyn_plc.ldb
```

- ▶ To run the routing tool and show the routing result, use `rte_run` and `rte_report` commands followed by `des_write_udb -w` command to save the current design:

```
rte_run
rte_report
des_write_udb -w myrdbsyn_rte.ldb
```

- ▶ To view the detailed report or summary timing, use `sta_report_timing -summary` command:

```
sta_report_timing -summary
```

- ▶ To generate bitstream file, use `bit_generate` command followed by `-w` command to force to overwrite the existing file:

```
bit_generate -w mydb_bit
```

- ▶ To end the program, quit the command to end the flow:

```
quit
```

#### 4. Reading the Post-Map UDB File

This section shows you how to read a post-map .ldb file and continue the design process.

- ▶ To read the post-map UDB file, use `des_read_udb` command followed by the database file name. In the next line, use `des_set_attribute` command followed by `-impl_dir` to define the directory where the project file is stored:

```
des_read_udb mydb_map.ldb
des_set_attribute -impl_dir impl_ldb_map
```

- ▶ To run the placement tool and show the report placement information, use `plc_run` and `plc_report` commands followed by `des_write_udb -w` command to save the current design:

```
plc_run
plc_report
des_write_udb -w myldbmap_plc.ldb
```

- ▶ To end the program, quit the command to end the flow:

```
quit
```

## 5. Reading and Routing the Post-Placement Design

This section describes the process of reading the post-placement database, routing, and saving the design.

- ▶ To read the post-synthesis database, use `des_read_udb` command followed by the database file name. Execute using `des_set_attribute` command followed by `-impl_dir` to define the directory where the project file is stored.

```
des_read_udb mydb_plc.ldb
des_set_attribute -impl_dir impl_rdb_plc
```

- ▶ To run the routing tool and show the routing result, use `rte_run` and `rte_report` commands followed by `des_write_udb -w` command to save the current design.

Use `sta_report_timing -summary` command to view the detailed report or timing summary and use `des_write_udb` command with `-w` command to overwrite or save the design.

```
rte_run
rte_report
sta_report_timing -summary
des_write_udb -w myrdbplc_rte.ldb
```

- ▶ To end the program, quit the command to end the flow.

```
quit
```

## 6. Opening a Post-Synthesis Milestone

This section shows how to open a post-synthesis milestone in a project, and load the run result in memory. When the design is in memory, you can continue to use non-project commands to continue the flow and access the design data.

- ▶ To open a project, use `prj_open` command followed by the file name.

```
prj_open mydb_syn.rdf
```

- ▶ To open a project milestone, use `prj_open_milestone` command followed by `-postsyn` to open the logical netlist.

```
prj_open_milestone -postsyn
```

- ▶ To run the map tool and write the design as a `.ldb` file, use `map_run` command followed by `des_write_udb` and save using `-w` command to run the design.

```
map_run
des_write_udb -w myprjsyn_map.ldb
```

- ▶ To end the program, quit the command to end the flow

```
quit
```

- ▶ [Launching the Tcl Console](#)
- ▶ [Running Radiant Tcl](#)
- ▶ [Accessing Command Help and Command Options in the Tcl Console](#)
- ▶ [Creating and Running Custom Tcl Scripts](#)
- ▶ [Running Tcl Scripts When Launching the Radiant Software](#)
- ▶ [Radiant Software Tool Tcl Command Syntax](#)
- ▶ [Tcl Manual](#)

## Accessing Command Help and Command Options in the Tcl Console

There are two ways to find all the Tcl command syntax help to generate all the tools in the Tcl console.

**To access command syntax help in the Tcl Console:**

1. In the prompt, type **help <tool\_\*keyword\*>** and press **Enter**:

```
% help {des_*instance*}
```

A list of valid command options appears in the Tcl Console.

2. In the Tcl Console, type the name of the command or function for more details on syntax and usage.

For example:

- ▶ `des_list_instance` is used to list design instances.
- ▶ `des_report_instance` is used to report instance information.

A list of valid arguments for that function appears.

```
% help des_report_instance
Usage information:
  Var/FlagName Type   Value Help
  -----
  (-help                gives this help)
  -file                 string ()   File name
  ?objects?             string ()   List instances.
```

**Note**

In interactive mode, you can use command **-help** to get the list of command information. However, most commands in the **-help** option are not true option, and the Tcl interpreter interprets command **-help** as a usage error, which prevents a script from finishing execution if it encounters this option. It is recommended to use **help {command}** as this works in both interactive and script settings.

## Changes in the Interface

The Radiant Tcl has the same Windows settings and appearance as the Radiant Tcl, with some GUI improvements.

- ▶ Running the **radiantc** replaces the standalone tools such as Map, PAR, and Bitgen for milestone runs for **Map Design, Place & Route**, and **Export Files** using specific Tcl files, which are stored in the implementation directory as `<prj>_<impl>_map/par/bit.tcl`.
- ▶ When you open the milestone run result, the **File > Open** menu displays the **Post-Synthesis Milestone, Post-Map Milestone**, and **Post-Par Milestone**, allowing you to perform non-project commands such as `des_report` in the new **radiantc** terminal.

- ▶ [Creating and Running Custom Tcl Scripts](#)
- ▶ [Running Tcl Scripts When Launching the Radiant Software](#)
- ▶ [Radiant Software Tool Tcl Command Syntax](#)
- ▶ [Tcl Manual](#)

## Creating and Running Custom Tcl Scripts

This topic describes how to easily create Tcl scripts using the Radiant software's user interface and manual methods. FPGA design using Tcl scripts provides some distinct advantages over using the graphical user interface's lists, views and menu commands. For example, Tcl scripts allow you to do the following:

- ▶ Set the tool environment to exactly the same state for every design run. This eliminates human errors caused by forgetting to manually set a critical build parameter from a drop-down menu.
- ▶ Manipulate intermediate files automatically, and consistently on every run. For example, .vm file errors can be corrected prior to performing additional netlist transformation operations.
- ▶ Run your script automatically by using job control software. This gives you the flexibility to run jobs at any time of day or night, taking advantage of idle cycles on your corporate computer system.

### Creating Tcl Scripts

There are a couple of different methods you can use to create the Radiant software Tcl scripts. This section will discuss each one and provide step-by-step instructions for you to get started Tcl scripting repetitious Radiant software commands or entire workflows.

One method you have available is to use your favorite text editor to enter a sequence of the Radiant software Tcl commands. The syntax of each the Radiant software Tcl commands is available in later topics in this portion of the Help. This method should only be used by very experienced Radiant software Tcl command line users.

The preferred method is to let the Radiant software GUI assist you in getting the correct syntax for each Tcl command. When you interact with the Radiant software user interface each time you launch a *scriptable* process and the corresponding Radiant software Tcl command is echoed to the Tcl Console. This makes it much simpler to get the correct command line syntax for each Radiant software command. Once you have the fundamental commands executed in the correct order, you can then add additional Tcl code to perform error checking, or customization steps.

#### To create a Tcl command script in the Radiant software:

1. Start the Radiant software design software and close any project that may be open.
2. In the Tcl Console execute the custom **reset** command. This clears the Tcl Console command history.
3. Use the Radiant software graphical user interface to start capturing the basic command sequence. The Tcl Console echos the commands in its window. Start by opening the project for which you wish to create the Tcl script. Then click on the processes in the Process bar to run them. For example, run these processes in their chronological order in the design flow:

- ▶ Synthesize Design
- ▶ Map Design
- ▶ Place & Route Design
- ▶ Export Files

4. In the Tcl Console window enter the command,

```
save_script <filename.ext>
```

The <filename.ext> is any file identifier that has no spaces and contains no special characters except underscores. For example, **myscript.tcl** or **design\_flow\_1.tcl** are acceptable save\_script values, but **my\$script** or **my script** are invalid. The <filename.ext> entry can be preceded with an absolute or relative path. Use the "/" (i.e. forward slash) character to delimit the path elements. If the path is not specified explicitly the script is saved in the current working directory. The current working directory can be determined by using the Tcl *pwd* command.

5. You can now use your favorite text editor to make any changes to the script you feel are necessary. Start your text editor, navigate to the directory the *save\_script* command saved the base script, and open the file.

**Note**

In most all cases, you will have to clean up the script you saved and remove any invalid arguments or any commands that cannot be performed in the Radiant software environment due to some conflict or exception. You will likely have to revisit this step later if after running your script you experience any run errors due to syntax errors or technology exceptions.

**Sample Radiant Software Tcl Script**

The following Radiant software Tcl script shows a simple script that opens a project, runs the entire design flow through the Place & Route process, then closes the project. A typical script will contain more tasks and will check for failure conditions. Use this simple example as a general guideline.

**Figure 1: Sample Radiant Software Script**

```
prj_archive -dir "C:/my_radiant/counter" -extract "C:/lsccl/radiant/1.1/examples/counter.zip"
prj_run_par
prj_close
```

**Running Tcl Scripts**

The Radiant software Tcl scripts are run exclusively from the Radiant Tcl Console. You can use either the Tcl Console integrated into the Radiant software UI, or by launching the stand-alone Tcl Console.

**To run a Tcl script in the Radiant software:**

1. Launch the Radiant software GUI, or the stand-alone Tcl Console.  
Open the Radiant software but do not open your project. If your project is open, choose **File > Close Project**.
2. If you are using the Radiant software main window, click the small arrow pane switch in the bottom of the Radiant software main window, and then click on the **Tcl Console tab** in the Output area at the bottom to open the console.
3. Use the Tcl *source* command to load and run your Tcl script. The *source* command requires, as it's only argument, the filename of the script you want to load and run. Prefix the script file name with any required relative or absolute path information. To run the example script shown in the previous section use:

```
source C:/lsccl/radiant/<version_number>/examples/counter/
myscript2.tcl
```

As long as there are no syntax errors or invalid arguments, the script will open the project, synthesize, map, and place-and-route the design. Once the design finishes it closes the project. If there are errors in the script, you will see the errors in red in the Tcl Console after you attempt to run it.

Go back to your script and correct the errors that prevented the script from running.

## Running Tcl Scripts When Launching the Radiant Software

This topic describes how launch the Radiant software and automatically run Tcl scripts using a command line shell or the stand-alone Tcl console. Your Tcl script can be standard Tcl commands as well as the Radiant software-specific Tcl commands.

Refer to [Creating and Running Custom Tcl Scripts](#) for more information on creating custom Tcl scripts.

**To launch the Radiant software and run a Tcl script from a command line shell or the stand-alone Tcl console:**

- ▶ Enter the following command:

On Windows:

```
radiant.exe -t <tcl_path_file>
```

On Linux:

```
radiant -t <tcl_path_file>
```

**Sample Radiant software Tcl Script** The following Radiant software Tcl script shows a very simple script, running in Windows, that opens a project and runs the design flow through the MAP process. Use this simple example as a general guideline.

```
prj_open C:/test/iobasic_radiant/iol.rdf  
prj_run_map
```

The above example is saved in Windows as the file mytcl.tcl in the directory C:/test. By running the following command from either a DOS shell or the Tcl

console in Windows, the Radiant software GUI starts, the project io1.rdf opens, and the MAP process automatically runs.

```
radiant.exe -t c:/test/mytcl.tcl
```

## Radiant Software Tool Tcl Command Syntax

This Tcl Command Reference Guide introduces the syntax of each of the Radiant software tools and provides you with examples to help you construct your own commands and scripts.

The Radiant software tries to make it easy to develop Tcl scripts by mirroring the correct command syntax in the Tcl Console based on the actions performed by you in the GUI. This process works well for most designs, but there are times when a greater degree of control is required. More control over the build process is made available through additional command line switches. The additional switches may not be invoked by actions taken by you when using the GUI. The next sections provide additional information about the Tcl commands implemented in the Radiant software.

The Tcl commands are broken into major categories. The major categories are:

- ▶ [General Radiant Commands](#)
  - ▶ [Radiant Software Tcl Console Commands](#)
  - ▶ [System Tcl Commands](#)
  - ▶ [Device Tcl Commands](#)
  - ▶ [Message Control Tcl Commands](#)
- ▶ [Project Flow Commands](#)
  - ▶ [Radiant Software Project Tcl Commands](#)
- ▶ [Non-project Commands](#)

## General Radiant Commands

### Radiant Software Tcl Console Commands

The Radiant software Tcl Console provides a small number of commands that allow you to perform some basic actions upon the Tcl Console Pane. The Radiant software Tcl Console commands differ from the other Tcl commands provided in the Radiant software. This dtc program's general Tcl Console commands do not use the *dtc\_* prefix in the command syntax as is the convention with other tools in the Radiant software.

#### Note

---

Tcl Command Log is always listed after the project is closed. You can find it in the Reports section under Misc Report > Tcl Command Log.

---

The following table provides a listing of all valid Radiant software Tcl Console-related commands.

**Table 23: Radiant Software Tcl Console Commands**

| Command            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>clear</b>       | Erase anything present in the Tcl Console pane and print the current <i>prompt</i> character in the upper left corner of the Tcl Console pane without erasing the command history.                                                                                                                                                                                                                                                                                                            |
| <b>history</b>     | <p>List the command history in the Tcl Console that you executed in the current session.</p> <p>Every command entered into the Tcl Console, either by the GUI, or by direct entry in the Tcl Console, is recorded so that it can be recalled at any time.</p> <p>The command history list is cleared when a project is <i>opened</i> or when the Tcl Console <i>reset</i> command is executed.</p>                                                                                            |
| <b>reset</b>       | <p>Clear the Tcl Console pane and erase all entries in the command line history.</p> <p><b>**This command is only used in the GUI Tcl console and not supported in the standalone Tcl console.</b></p>                                                                                                                                                                                                                                                                                        |
| <b>save_script</b> | <p>Save the contents of the command line history memory buffer into the script file specified.</p> <p>The script is, by default, stored into the current working directory. File paths using forward slashes used with an identifier are valid if using an absolute file path to an existing script folder.</p> <p>Usage: <code>save_script &lt;filename.ext&gt;</code></p> <p><b>**This command is only used in the GUI Tcl console and not supported in the standalone Tcl console.</b></p> |
| <b>set_prompt</b>  | <p>Set the default prompt character.</p> <p>The default prompt character in the Tcl Console is the “greater than” symbol or angle bracket (i.e., &gt;). You can change this prompt character to some other special character such as a dollar sign (\$) or number symbol (#) if you prefer.</p> <p>Usage: <code>set_prompt &lt;new_character&gt;</code></p> <p><b>**This command is only used in the GUI Tcl console and not supported in the standalone Tcl console.</b></p>                 |

### Radiant Software Tcl Console Command Examples

This section illustrates and describes a few samples of Radiant Tcl Console commands.

### Example 1

To save a script, use the `save_script` command in the Tcl Console window with a name or file path/name argument. In the first example command line, the file path is absolute, that is, it includes the entire path. Here you are saving “myscript.tcl” to the existing current working directory. The second example creates the same “myscript.tcl” file in the current working directory.

```
save_script C:/lsc/radiant/myproject/scripts/myscript.tcl
save_script myscript.tcl
```

See [Creating and Running Custom Tcl Scripts](#) for details on how to save and run scripts in the Radiant software.

### Example 2

The following `set_prompt` command reassigns the prompt symbol on the command line as a dollar sign (\$). The default is an angle bracket or “greater than” sign (>).

```
set_prompt $
```

### Example 3

The following `history` command will print all of the command history that was recorded in the current Tcl Console session.

```
history
```

## System Tcl Commands

The **sys** commands are used to show Radiant tool and system settings information. You can get these commands by using `help {sys_*}`.

### Radiant Software System Tcl Command Descriptions

The following table provides a listing of all valid Radiant software system-related Tcl command options and describes option functionality.

**Table 24: System Tcl Commands**

| Command                             | Description                     |
|-------------------------------------|---------------------------------|
| <a href="#">sys_install_path</a>    | Return Radiant executable path. |
| <a href="#">sys_install_version</a> | Return Radiant version.         |
| <a href="#">sys_list_attribute</a>  | List system attributes.         |
| <a href="#">sys_set_attribute</a>   | Set system attributes.          |

## **sys\_install\_path**

Return Radiant executable path

### **Syntax**

```
sys_install_path
```

### **Arguments**

### **Example**

```
sys_install_path
```

### **See Also**

```
sys_install_version
```

▶ [“System Tcl Commands” on page 1789](#)

## **sys\_install\_version**

Return Radiant version

### **Syntax**

```
sys_install_version
```

### **Arguments**

### **Example**

```
sys_install_version
```

### **See Also**

```
sys_install_path
```

▶ [“System Tcl Commands” on page 1789](#)

## **sys\_list\_attribute**

List system attributes.

### **Syntax**

```
sys_list_attribute
```

### **Arguments**

### Example

```
sys_list_attribute
```

### See Also

- ▶ [sys\\_set\\_attribute](#)
- ▶ [“System Tcl Commands” on page 1789](#)

## sys\_set\_attribute

Set system attributes.

### Syntax

```
sys_set_attribute [-echo <value>] [-reg <value>]  
[-gui <value>] [-msg <value>]
```

### Arguments

- ▶ **-echo <value>**: value must be: {on,off} Allows you to enable or disable the command summary line. (optional)
- ▶ **-reg <value>**: value must be: {on,off}. Allows you to output RAT\_REG\_RECORD\_ON or RAT\_REG\_RECORD\_OFF. (optional)
- ▶ **-gui <value>**: value must be: {on,off}. The run is called from gui if its value is on. (optional)
- ▶ **-msg <filename>**: Set message setting file to <filename>. (optional)

### Example

```
sys_set_attribute -echo on -reg off
```

### See Also

- ▶ [sys\\_list\\_attribute](#)
- ▶ [“System Tcl Commands” on page 1789](#)

## Device Tcl Commands

The **dev** commands are used re used to access or report device information. You can get these commands by using **help {dev\_\*}**.

The following table provides a listing of all valid Radiant software device-related Tcl command options and describes option functionality.

**Table 25: Device Tcl Commands**

| Command                              | Description             |
|--------------------------------------|-------------------------|
| <a href="#">dev_list_device</a>      | List device.            |
| <a href="#">dev_list_family</a>      | List family.            |
| <a href="#">dev_list_operation</a>   | List operation.         |
| <a href="#">dev_list_package</a>     | List package.           |
| <a href="#">dev_list_performance</a> | List performance grade. |

## dev\_list\_device

List device

### Syntax

```
dev_list_device -family <family> [-p <pattern>]
```

### Arguments

- ▶ **-family <family>**: Specify the device family name.
- ▶ **-p <pattern>**: Specify the device name. Wildcard is supported. If not specified, return all device names under given family. (optional)

### Example

```
dev_list_device -family LIFCL
dev_list_device -family LIFCL -p *17
```

### See Also

- ▶ [“Device Tcl Commands” on page 1791](#)

## dev\_list\_family

List family

### Syntax

```
dev_list_family [-p <pattern>]
```

### Arguments

- ▶ **-p <pattern>**: Specify the family name. Wild card is supported. If not specified, return all device family names. (optional)

### Example

```
dev_list_family  
dev_list_family -p LIF*
```

### See Also

- ▶ [“Device Tcl Commands” on page 1791](#)

## dev\_list\_operation

List operation

### Syntax

```
dev_list_operation -family <family> -device <device> -package  
<package> -performance <performance>
```

### Arguments

- ▶ **-family <family>**: Specify the device family name.
- ▶ **-device <device>**: Specify the device name.
- ▶ **-package <package>**: Specify the package name.
- ▶ **-performance <performance>**: Specify the performance grade.

### Example

```
dev_list_operation -family LIFCL -device LIFCL-17 -package  
CABGA256 -performance 9_High-Performance_1.0V
```

### See Also

- ▶ [“Device Tcl Commands” on page 1791](#)

## dev\_list\_package

List package

### Syntax

```
dev_list_package -family <family> -device <device>  
[-p <pattern>]
```

### Arguments

- ▶ **-family <family>**: Specify the device family name.
- ▶ **-device <device>**: Specify the device name.

- ▶ **-p <pattern>**: Specify the package name. Wild card is supported. If not specified, return all package names under given family & device. (optional)

### Example

```
dev_list_package -family LIFCL -device LIFCL-17
dev_list_package -family LIFCL -device LIFCL-17 -p *256
```

### See Also

- ▶ [“Device Tcl Commands” on page 1791](#)

## dev\_list\_performance

List performance grade

### Syntax

```
dev_list_performance -family <family> -device <device>
                    -package <package>
```

### Arguments

- ▶ **-family <family>**: Specify the device family name.
- ▶ **-device <device>**: Specify the device name.
- ▶ **-package <package>**: Specify the package name.

### Example

```
dev_list_performance -family LIFCL -device LIFCL-17
                    -package CABGA256
```

### See Also

- ▶ [“Device Tcl Commands” on page 1791](#)

## IP Version Update Tcl Commands

This section provides the IP upgrade version Tcl command syntax, command options, and usage examples.

### IP Version Update Command Descriptions

The following table provides a listing of all valid Radiant software IP version update-related Tcl command options and describes option functionality.

**Table 26: IP Version Update Commands**

| Command                              | Description                                                                    |
|--------------------------------------|--------------------------------------------------------------------------------|
| <a href="#">ip_catalog_install</a>   | Install an IP from local or from server.                                       |
| <a href="#">ip_catalog_list</a>      | List supported IPs in local.                                                   |
| <a href="#">ip_catalog_uninstall</a> | Uninstall an IP from local.                                                    |
| <a href="#">ip_upgrade</a>           | Update all .ipx resource files with the new IP version in the Radiant project. |

### ip\_catalog\_install

Install one IP from local ipk file or one IP from server.

#### Syntax

```
ip_catalog_install [-vlnv <IP vlnv>] [-file <ipk file name>]
```

#### Arguments

- ▶ **-vlnv:** IP's information which contains vendor library name and version, use tcl 'ip\_catalog\_list -server' to get it (optional).  
Format: 'vendor:library:name:version'.
- ▶ **-file:** Location of ipk file (optional).

#### Example

```
ip_catalog_install -vlnv
latticesemi.com:module:sin_cos_table:1.3.0
ip_catalog_install -file D:/ipResource/sin_cos_table.ipk
```

#### See Also

- ▶ [“ip\\_catalog\\_uninstall” on page 1789](#)

## ip\_catalog\_list

Return a list of IP, local IP contains the IP from Radiant install package, IP server and customer's packaged IP, server IP contains the IP in server. Only get local IP by default.

### Syntax

```
ip_catalog_list [-name <IP wild name>]  
[-library <IP wild library>] [-vendor <IP wild vendor>]  
[-version <IP wild version>] [-server] [-supported] [-installed]
```

### Arguments

- ▶ **-server:** Get IP list in server (optional).
- ▶ **-supported:** Only list supported local IPs (optional).
- ▶ **-installed:** Only list installed local IPs (optional).
- ▶ **-latest:** Only list latest version (optional).
- ▶ **-name <IP wild name>:** List IP with specified name (optional).
- ▶ **-library <IP wild library>:** List IP with specified library (optional).
- ▶ **-vendor <IP wild vendor>:** List IP with specified vendor (optional).
- ▶ **-version <IP wild version>:** List IP with specified version (optional).

### Example

```
ip_catalog_list -server -name I2C  
ip_catalog_list -installed
```

### See Also

- ▶ [“IP Version Update Tcl Commands” on page 1795](#)

## ip\_catalog\_uninstall

Uninstall one IP from local IPs, ip\_catalog\_list can list all installed local IPs.

### Syntax

```
ip_catalog_uninstall -vlnv <IP vlnv>
```

### Arguments

- ▶ **-vlnv**: IP's information which contains vendor library name and version, use tcl 'ip\_catalog\_list -installed' to get it.

Format: 'vendor:library:name:version'.

### Example

```
ip_catalog_uninstall -vlnv  
latticesemi.com:module:sin_cos_table:1.3.0
```

### See Also

- ▶ [“ip\\_catalog\\_install” on page 1787](#)

## ip\_upgrade

Upgrade and regenerate the IP (latest version) in a project.

### Syntax

```
ip_upgrade [-all] [-ipx <ipx file path>] [-force_update]
[-version <version number>]
```

### Arguments

- ▶ **-all:** Upgrade all IPs to the latest version that can be found locally (optional).
- ▶ **-ipx <ipx file path>:** Upgrade one IP to the latest version that can be found locally (optional).
- ▶ **-version <version number>:** Upgrade one IP to the specified version that can be found locally (optional).
- ▶ **-force\_update:** Upgrade the ipx file with latest version regardless of whether it is compatible or not, which may cause generation errors (optional).

### Example

```
ip_upgrade -ipx D:/radiant_design/counter/adder1.ipx -
force_update
ip_upgrade -ipx D:/radiant_design/counter/adder1.ipx -version
1.3.0
ip_upgrade -all -force_update
```

### See Also

- ▶ [“IP Version Update Tcl Commands” on page 1795](#)

## Message Control Tcl Commands

This section provides Message Control extended Tcl command syntax, command options, and usage examples.

### Message Control Tcl Command Descriptions

The following table provides a listing of all valid Radiant software message control-related Tcl command options and describes option functionality.

**Table 27: Message Control Tcl Commands**

| Command                           | Description                                                                                 |
|-----------------------------------|---------------------------------------------------------------------------------------------|
| <a href="#">msg_clean</a>         | Clean promoted, disabled and suppressed message(s) from the current project.                |
| <a href="#">msg_clean_setting</a> | Clean the setting of promoted, disabled and suppressed message(s) from the current project. |
| <a href="#">msg_demote</a>        | Reset message promotion type from the current project.                                      |
| <a href="#">msg_disable</a>       | Disable the message from the current project.                                               |
| <a href="#">msg_list_status</a>   | List all promoted, disabled or suppressed messages from the current project.                |
| <a href="#">msg_load</a>          | Load the setting of all promoted, disabled and suppressed messages from the file.           |
| <a href="#">msg_promote</a>       | Set message promotion type from the current project.                                        |
| <a href="#">msg_save</a>          | Save the setting of all promoted, disabled and suppressed messages to the file.             |
| <a href="#">msg_suppress</a>      | Suppress the message from the current project.                                              |

## msg\_clean

Commands to clean promoted, disabled and suppressed message(s) from the current project.

### Syntax

```
msg_clean <message Id>|-all
```

### Arguments

- ▶ **<message Id>**: This option specifies implementation name (optional).
- ▶ **-all**: Clean the setting of all promoted, disabled and suppressed messages.

### Example

```
msg_clean 1026001
msg_clean -all
```

### See Also

- ▶ [“Message Control Tcl Commands” on page 1798](#)

## msg\_clean\_setting

Commands to clean the setting of promoted, disabled and suppressed message(s) from the current project.

### Syntax

```
msg_clean_setting <message Id>|-warning|-info|-all
```

### Arguments

- ▶ **<message Id>**: This option specifies the message id.
- ▶ **-warning**: Clean the setting for warning messages.
- ▶ **-info**: Clean the setting for info messages.
- ▶ **-all**: Clean the setting for all the messages.

### Example

```
msg_clean_setting 1026001
msg_clean_setting -warning
msg_clean_setting -info
msg_clean_setting -all
```

### See Also

- ▶ [“Message Control Tcl Commands” on page 1798](#)

## msg\_demote

Commands to reset message promotion type from the current project.

### Syntax

```
msg_demote <message Id>
```

### Arguments

- ▶ **<message Id>**: This option specifies the message id.

### Example

```
msg_demote 1026001
```

### See Also

- ▶ [“Message Control Tcl Commands” on page 1798](#)

## msg\_disable

Commands to disable the message from the current project.

### Syntax

```
msg_disable <message Id>|-warning|-info
```

### Arguments

- ▶ **<message Id>**: This option specifies the message id.
- ▶ **-warning**: Disable all warning messages.
- ▶ **-info**: Disable all info messages.

### Example

```
msg_disable 1026001
msg_disable -warning
msg_disable -info
```

### See Also

- ▶ [“Message Control Tcl Commands” on page 1798](#)

## msg\_list\_status

Commands to list all promoted, disabled or suppressed messages from the current project.

### Syntax

```
msg_list_status [-promoted|-disabled|-suppressed]
```

### Arguments

- ▶ **-promoted**: List all promoted messages (optional).
- ▶ **-disabled**: List all disabled messages (optional).
- ▶ **-suppressed**: List all suppressed messages (optional).

### Example

```
msg_list_status
msg_list_status -promoted

msg_list_status -disabled
msg_list_status -suppressed
```

### See Also

- ▶ [“Message Control Tcl Commands” on page 1798](#)

## msg\_load

Commands to load the setting of all promoted, disabled and suppressed messages from the file, default is promote.xml.

### Syntax

```
msg_load [<message xml or pmt file>]
```

### Arguments

- ▶ **<message xml or pmt file>**: This option specifies the message xml or pmt file (optional).

### Example

```
msg_load
msg_load promote.xml
msg_load promote.pmt
```

### See Also

- ▶ [“Message Control Tcl Commands” on page 1798](#)

## msg\_promote

Commands to set message promotion type from the current project. Use msg\_save command after promoting a message to ensure the message promotion settings are saved.

### Syntax

```
msg_promote <message Id> [-type 0|1|2|3]
```

### Arguments

- ▶ **<message Id>**: This option specifies the message id.
- ▶ **-type 0|1|2|3**: This option the message promotion type, 0 is error, 1 is critical, 2 is warning, and 3 is info (optional).

### Example

```
msg_promote 1026001
msg_promote 1026001 -type 2
```

### See Also

- ▶ [“Message Control Tcl Commands” on page 1798](#)

## msg\_save

Commands to save the setting of all promoted, disabled and suppressed messages to the file, default is promote.xml.

### Syntax

```
msg_save [<message xml or pmt file>]
```

### Arguments

- ▶ **<message xml or pmt file>**: This option specifies the message xml or pmt file (optional).

### Example

```
msg_save
msg_save promote.xml
msg_save promote.pmt
```

### See Also

- ▶ [“Message Control Tcl Commands” on page 1798](#)

## msg\_suppress

Commands to suppress the message from the current project, set maximum display count.

### Syntax

```
msg_suppress <message Id> -cnt 0|<count>
```

### Arguments

- ▶ **<message Id>**: This option specifies the message id.
- ▶ **-cnt 0|<count>**: This option specifies maximum display count, 0 is disabled, and 'count' means how many times the message will only display.

### Example

```
msg_suppress 1026001 -cnt 10
```

# Project Flow Commands

The Radiant software Project Tcl Commands allow you to control the contents and settings applied to the tools, and source associated with your design. Projects can be opened, closed, and configured to a consistent state using the commands described in this section.

## Radiant Software Project Tcl Command Descriptions

The following table provides a listing of all valid Radiant software project-related Tcl command options and describes option functionality.

**Table 28: Radiant Software Project Tcl Commands**

| Command                                | Description                                                      |
|----------------------------------------|------------------------------------------------------------------|
| <a href="#">prj_activate_impl</a>      | Activate implementation in the current project.                  |
| <a href="#">prj_add_source</a>         | Add sources to the current project.                              |
| <a href="#">prj_archive</a>            | Archive the current project.                                     |
| <a href="#">prj_clean_impl</a>         | Clean up the implementation result files in the current project. |
| <a href="#">prj_clone_impl</a>         | Clone an existing implementation.                                |
| <a href="#">prj_close</a>              | Close the current project. Any unsaved changes are discarded.    |
| <a href="#">prj_copy_strategy</a>      | Create a new strategy by copying from an existing strategy.      |
| <a href="#">prj_create</a>             | Create a project.                                                |
| <a href="#">prj_create_impl</a>        | Create a new implementation in the current project.              |
| <a href="#">prj_create_strategy</a>    | Create a new strategy with default settings.                     |
| <a href="#">prj_device</a>             | List the device.                                                 |
| <a href="#">prj_disable_source</a>     | Disable the design sources from the current project.             |
| <a href="#">prj_enable_source</a>      | Enable the design sources from the current project.              |
| <a href="#">prj_get_impl_path</a>      | Return active or given implementation folder path.               |
| <a href="#">prj_get_strategy_value</a> | Get value of a strategy item.                                    |
| <a href="#">prj_import_strategy</a>    | Import an existing strategy file.                                |
| <a href="#">prj_list_source</a>        | List source files in current project.                            |
| <a href="#">prj_list_strategy</a>      | List value of strategy items.                                    |
| <a href="#">prj_open</a>               | Open a project file.                                             |
| <a href="#">prj_open_milestone</a>     | Open project milestone netlist files.                            |

**Table 28: Radiant Software Project Tcl Commands**

| Command                                | Description                                                                  |
|----------------------------------------|------------------------------------------------------------------------------|
| <a href="#">prj_remove_impl</a>        | Delete the specified implementation from the current project.                |
| <a href="#">prj_remove_source</a>      | Delete design source from the current project.                               |
| <a href="#">prj_remove_strategy</a>    | Delete an existing strategy.                                                 |
| <a href="#">prj_run_bitstream</a>      | Run bitstream process.                                                       |
| <a href="#">prj_run_map</a>            | Run map process.                                                             |
| <a href="#">prj_run_par</a>            | Run place & route process.                                                   |
| <a href="#">prj_run_synthesis</a>      | Run synthesis process.                                                       |
| <a href="#">prj_save</a>               | Save current project.                                                        |
| <a href="#">prj_saveas</a>             | Save the current project as a new project with specified name and directory. |
| <a href="#">prj_set_device</a>         | Set the device.                                                              |
| <a href="#">prj_set_impl_opt</a>       | List, set or remove implementation options in the current project.           |
| <a href="#">prj_set_opt</a>            | List, set or remove a project option.                                        |
| <a href="#">prj_set_postscript</a>     | List or set user Tcl script after running milestone.                         |
| <a href="#">prj_set_prescript</a>      | List or set user Tcl script before running milestone.                        |
| <a href="#">prj_set_reference_udb</a>  | Set reference UDB for incremental run or disable it.                         |
| <a href="#">prj_set_source_format</a>  | Set a source format.                                                         |
| <a href="#">prj_set_source_opt</a>     | List, set or remove a source option.                                         |
| <a href="#">prj_set_strategy</a>       | Associate the strategy with the specified implementation.                    |
| <a href="#">prj_set_strategy_value</a> | Set value to a strategy item.                                                |
| <a href="#">prj_set_top_module</a>     | Set top module in the current implementation.                                |

**This section displays the usage information of the commands:**

## **prj\_activate\_impl**

Activate implementation in the current project.

### **Syntax**

```
prj_activate_impl <impl name>
```

### **Arguments**

- ▶ **<impl name>**: Specify implementation name.

### Example

```
prj_activate_impl "myimpl"
```

### See also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_add\_source

Add sources to the current project

### Syntax

```
prj_add_source [-impl <implement name>]
[-simulate_only|-synthesis_only] [-work <VHDL lib name>]
[[ -opt <name=value>] ...] [-exclude] <src file>...
```

### Arguments

- ▶ **-impl <implement name>**: Specify the implementation name. If not specified, use the default implementation (optional).
- ▶ **-simulate\_only|-synthesis\_only**: Indicate new added source can be simulation or synthesis only (optional).
- ▶ **-work <VHDL lib name>**: Indicate VHDL library name. Default library name is "work" (optional).
- ▶ **-opt <name=value>**: Specify one or multiple option value pair of source file (optional).
- ▶ **-exclude**: Indicate the source to be excluded from the project (optional).
- ▶ **<src file>**: Specify one or multiple source file paths.

### Example

- ▶ `prj_add_source -synthesis_only "D:/my_design/counter/source/count_attr.v"`
- ▶ `prj_add_source -work mywork D:/my_design/counter/source/my.vhd`

### See also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_archive

Archive the current project or extract the archive file.

**Syntax**

```
prj_archive [-includeAll] <archive_file>
: Archive the current project into the archive_file
prj_archive -extract -dir <destination directory>
<archive_file>
: Extract the archive file and load the project
```

**Arguments**

- ▶ **-includeAll:** Indicate to include all files under project folder into archive file (optional).
- ▶ **<archive\_file>:** Specify the archive file (.zip) path.
- ▶ **-extract:** Indicate to extract the specified archive file.
- ▶ **-dir <destination directory>:** Specify the destination directory to extract archive file. This directory should exist in disk.

**Example**

```
prj_archive -includeAll "D:/my_desgin/counter/counter.zip"
prj_archive -dir D:/my_design/newcounter -extract
D:/my_design/counter/counter.zip
```

**See Also**

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_clean\_impl

Clean up the implementation result files in the current project.

**Syntax**

```
prj_clean_impl [-impl <implement name>]
```

**Arguments**

- ▶ **-impl <implement name>:** (Optional) Specify implementation name. If not specified, use the default implementation.

**Example**

```
prj_clean_impl
prj_clean_impl -impl myimpl
```

**See Also**

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_clone\_impl

Clone an existing implementation.

### Syntax

```
prj_clone_impl <new impl name> [-dir <new impl directory>]  
[-copyRef] [-impl <original impl name>]
```

### Arguments

- ▶ **-name <new impl name>**: Specify the new implementation name.
- ▶ **-dir <new impl directory>**: Specify the new implementation directory (optional).
- ▶ **-copyRef**: Indicate to copy all source files from original to new implementation (optional).
- ▶ **-impl <original impl name>**: Specify the original implementation name. If not specified, use the default implementation (optional).

### Example

```
prj_clone_impl newimpl -copyRef -impl myimpl
```

### See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_close

Close the current open project.

### Syntax

```
prj_close
```

### Example

```
prj_close
```

### See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_copy\_strategy

Create a new strategy by copying from an existing strategy.

### Syntax

```
prj_copy_strategy -from <source strategy name> -name
<new strategy name> -file <strategy file name>
```

### Arguments

- ▶ **-from <source strategy name>**: Specify the source strategy name.
- ▶ **-name <new strategy name>**: Specify new strategy name.
- ▶ **-file <strategy file name>**: Specify strategy file (.sty) path. This file is used to save new strategy setting.

### Example

```
prj_copy_strategy -from Strategy1 -name mystrategy -file
d:/my_desgin/counter/mystrategy.sty
```

### See Also

- ▶ ["Radiant Software Project Tcl Commands" on page 1796](#)

## prj\_create

Create a new project.

### Syntax

```
prj_create -name <project name> [-dir <project directory>]
[-dev <device name>] [-performance <performance grade>]
[-impl <initial implementation name>] [-impl_dir <initial
implementation directory>] [-synthesis <synthesis tool name>]
```

### Arguments

- ▶ **-name <project name>**: Specify the project name.
- ▶ **-dir <project directory>**: Specify the project directory (optional).
- ▶ **-dev <device name>**: Specify the device part name.
- ▶ **-performance <performance grade>**: Specify the device performance grade.
- ▶ **-impl <initial implementation name>**: Initial implement name, default name is 'impl\_1' (optional).
- ▶ **-impl\_dir <initial implementation directory>**: Implement directory name, default directory name is same as name implementation name (optional).
- ▶ **-synthesis <synthesis tool name>**: Synthesis tool type. The valid synthesis name is "synplify" and "lse".

### Example

```
prj_create -name "counter" -impl "impl_1" -dev LIFCL-17-9BG256C
-performance "9_High-Performance_1.0V" -synthesis "synplify"
```

```
prj_create -name myproj -dev LIFCL-17-9BG256C -performance
"9_High-Performance_1.0V" -impl myimpl -impl_dir impldir -
synthesis lse
```

### See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_create\_impl

Create a new implementation in the current project.

### Syntax

```
prj_create_impl <new impl name> [-dir <implementation
directory>] [-strategy <default strategy name>]
[-synthesis <synthesis tool name>]
```

### Arguments

- ▶ **-name <new impl name>**: Specify the implementation name.
- ▶ **-dir <implementation directory>**: Specify the implementation directory. It's a subdirectory name under project path.
- ▶ **-strategy <default strategy name>**: Specify the strategy name (optional).
- ▶ **-synthesis <synthesis tool name>**: Synthesis tool type. The valid synthesis name is “synplify” and “lse”.

### Example

```
prj_create_impl myimpl -strategy Strategy1
prj_create_impl myimpl -dir myimpldir -synthesis "synplify"
```

### See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_create\_strategy

Create a new strategy with default setting

### Syntax

```
prj_create_strategy -name <new strategy name> -file
<strategy file name>
```

### Arguments

- ▶ **-name <new strategy name>**: Specify new strategy name.

- ▶ **-file <strategy file name>:** Specify strategy file (.sty) path. This file is used to save new strategy setting.

### Example

```
prj_create_strategy -name mystrategy -file
d:/my_desgin/counter/mystrategy.sty
```

### See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_device

List the device information of the current project

### Syntax

```
prj_device [-family|-device|-package|-performance|
-operation|-part]
```

### Arguments

- ▶ **-family:** Return the family name (optional).
- ▶ **-device:** Return the device name (optional).
- ▶ **-package:** Return the package name (optional).
- ▶ **-performance:** Return the performance grade (optional).
- ▶ **-operation:** Return the device operation (optional).
- ▶ **-part:** Return the device part.

### Example

```
prj_device -family -device
prj_device -part
```

### See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_disable\_source

Disable the design sources from the current project.

### Syntax

```
prj_disable_source [-impl <implement name>] <src file> ...
```

### Arguments

- ▶ **-impl <implement name>**: Specify the implementation name. If not specified, use the default implementation (optional).
- ▶ **<src file>**: Specify one or multiple source files to be disabled.

### Example

```
prj_disable_source "D:/my_design/counter/source/count_attr.v"
```

### See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_enable\_source

Enable the design sources from the current project.

### Syntax

```
prj_enable_source [-impl <implement name>] <src file> ...
```

### Arguments

- ▶ **-impl <implement name>**: Specify the implementation name. If not specified, use the default implementation (optional).
- ▶ **<src file>**: Specify one or multiple source files to be enabled.

### Example

```
prj_enable_source "D:/my_design/counter/source/count_attr.v"
```

### See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_get\_impl\_path

Return active or given implementation folder path

### Syntax

```
prj_get_impl_path [-impl <implement>]
```

### Arguments

- ▶ **-impl <implement name>**: Specify implementation name. If not specified, use the default implementation.

**Example:**

```
prj_get_impl_path
prj_get_impl_path -impl myimpl
```

**See Also**

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## **prj\_get\_strategy\_value**

Get the value of a strategy item.

**Syntax**

```
prj_get_strategy_value [-strategy <strategy name>]
<option name>
```

**Arguments**

- ▶ **-strategy <strategy name>**: Specify the strategy name. If not specified, use the default strategy (optional).
- ▶ **<option name>**: Specify the strategy option name.

**Example**

```
prj_get_strategy_value -strategy Strategy1 map_ignore_sdc_error
prj_get_strategy_value par_disable_autohldtiming
```

**See Also**

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## **prj\_import\_strategy**

Import an existing strategy file.

**Syntax**

```
prj_import_strategy -name <new strategy name> -file
<strategy file name>
```

**Arguments**

- ▶ **-name <new strategy name>**: Specify new strategy name.
- ▶ **-file <strategy file name>**: Specify import strategy (.sty) path.

**Example**

```
prj_import_strategy -name mystrategy -file d:/my_desgin/
counter/strategy1.sty
```

### See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_list\_source

List source files in current project.

### Syntax

```
prj_list_source [-o <output_file>]
```

### Arguments

- ▶ **-o <output\_file>**: Specify the output file name. If not specified, list source files in stdout (optional).

### Example

```
prj_list_source
prj_list_source -o D:/my_design/counter/source.txt
```

### See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_list\_strategy

List value of strategy items

### Syntax

```
prj_list_strategy [-strategy <strategy name>] <pattern>
```

### Arguments

- ▶ **-strategy <strategy name>**: Specify the strategy name. If not specified, use the default strategy (optional).
- ▶ **<pattern>**: Specify the strategy option name. Wildcard is supported.

### Example

```
prj_list_strategy -strategy Strategy1 map_*
prj_list_strategy par_*
```

### See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_open

Open a project file.

### Syntax

```
prj_open <project file>
```

### Arguments

- ▶ **<project name>**: Specify project file (.rdf) path.

### Example

```
prj_open "d:/my_desgin/counter/counter.rdf"
```

### See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_open\_milestone

Commands to open project milestone netlist files.

### Syntax

```
prj_open_milestone -postsyn | -postmap | -postpar
```

### Arguments

- ▶ **-postsyn**: Open post-syn logical netlist (optional).
- ▶ **-postmap**: Open post-map physical netlist (optional).
- ▶ **-postpar**: Open post-par physical netlist.

Option '-postsyn' '-postmap' and '-postpar' are mutually exclusive.

### Example

```
prj_open_milestone -postsyn  
prj_open_milestone -postmap  
prj_open_milestone -postpar
```

### See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_remove\_impl

Delete the specified implementation from the current project.

### Syntax

```
prj_remove_impl <impl name>
```

### Arguments

- ▶ **<impl name>**: Specify the implementation name.

### Example

```
prj_remove_impl "myimpl"
```

### See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_remove\_source

Delete design source from the current project.

### Syntax

```
prj_remove_source [-impl <implement name>] -all  
:Remove all the design sources in project  
prj_remove_source [-impl <implement name>] <src file> ...  
:Remove the specified sources from the current project
```

### Arguments

- ▶ **impl <implement name>**: Specify the implementation name. If not specified, use the default implementation.
- ▶ **-all**: Indicate to remove all sources from the current implementation.
- ▶ **<src file>**: Specify one or multiple source files to be removed. This option is mutually exclusive with "-all".

### Example

```
prj_remove_source -all  
prj_remove_source "D:/my_design/counter/source/count_attr.v"
```

### See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_remove\_strategy

Delete an existing strategy

### Syntax

```
prj_remove_strategy <strategy name>
```

### Arguments

- ▶ **<strategy name>**: Specify the strategy name to be removed.

### Example

```
prj_remove_strategy mystrategy
```

### See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_run\_bitstream

Run bitstream process.

### Syntax

```
prj_run_bitstream [-forceAll|forceOne]
```

### Arguments

- ▶ **-forceAll**: Indicate to force to run all tasks (optional).
- ▶ **-forceOne**: Indicate to force to run current task (optional).

### Example

```
prj_run_bitstream  
prj_run_bitstream -forceAll
```

### See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_run\_map

Run map process.

### Syntax

```
prj_run_map [-forceAll|forceOne]
```

**Arguments**

- ▶ **-forceAll**: Indicate to force to run all tasks (optional).
- ▶ **-forceOne**: Indicate to force to run current task (optional).

**Example:**

```
prj_run_map  
prj_run_map -forceAll
```

**See Also**

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

**prj\_run\_par**

Run place and route process.

**Syntax**

```
prj_run_par [-forceAll|forceOne]
```

**Arguments**

- ▶ **-forceAll**: Indicate to force to run all tasks (optional).
- ▶ **-forceOne**: Indicate to force to run current task (optional).

**Example**

```
prj_run_par  
prj_run_par -forceAll
```

**See Also**

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

**prj\_run\_synthesis**

Run synthesis process

**Syntax**

```
prj_run_synthesis [-forceAll|forceOne]
```

**Arguments**

- ▶ **-forceAll**: Indicate to force to run all tasks (optional).
- ▶ **-forceOne**: Indicate to force to run current task (optional).

**Example**

```
prj_run_synthesis
```

**See Also**

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

**prj\_save**

Save the current project.

**Syntax**

```
prj_save [<project file>]
```

**Arguments**

- ▶ **<project file>**: Specify the Radiant project file (.rdf) path to be saved. If not specified, save to current opening project file (optional).

**Example**

```
prj_save
prj_save d:/my_desgin/counter/mycount.rdf
```

**See Also**

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

**prj\_saveas**

Save the current project as a new project with specified name and directory and change current workaroud of the new project.

**Syntax**

```
prj_saveas -name <new project name>
-dir <new project directory> [-copy_gen]
```

**Arguments**

- ▶ **-name <new project name>**: Specify the new Radiant project name.
- ▶ **-dir <new project directory>**: Specify the new Radiant project file directory.
- ▶ **-copy\_gen**: Indicate to copy intermediate database files, report files, and other Radiant-generated files into a new project.

### Example

```
prj_saveas -name newcounter -dir
d:/my_desgin/newcounter -copy_gen
```

### See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_set\_device

Set the device of current project.

### Syntax

```
prj_set_device [-family <family name>] [-device <device name>]
[-package <package name>] [-performance <performance grade>]
[-operation <operation>] [-part <part name>]
```

### Arguments

- ▶ **-family <family name>**: Specify the family name (optional).
- ▶ **-device <device name>**: Specify the device name (optional).
- ▶ **-package <package name>**: Specify the package name (optional).
- ▶ **-performance <performance grade>**: Specify the performance grade (optional).
- ▶ **-operation <operation>**: Specify the device operation (optional).
- ▶ **-part**: Specify the device part. If '-part' option is specified, other device options are ignored.

### Example:

```
prj_set_device -family LIFCL -device LIFCL-17 -package CABGA256
-performance 8_High-Performance_1.0V -operation COM
prj_set_device -part LIFCL-17-8BG256C
```

### See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_set\_impl\_opt

List, set, or remove implementation options in the current project.

### Syntax

```
prj_set_impl_opt [-impl <implement name>]:
List all the options in the specified implementation
prj_set_impl_opt [-impl <implement name>] <option name> [option
value list]: List or set the implementation's option value
```

```
prj_set_impl_opt [-impl <implement name>] -append <option name>
<option value>: Append a value to the specified option value
prj_set_impl_opt [-impl <implement name>] -rem <option name>...
: Remove the the options in the implementation"
```

### Arguments

- ▶ **-impl <implement name>**: Specify the implementation name. If not specified, use the default implementation.
- ▶ **<option value>**: Specify the option value.
- ▶ **<option value list>**: Specify one or multiple option values. If not specified, it lists the option value of given option name.
- ▶ **-append <option name> <option value>**: Append the specified value to current option value (optional).
- ▶ **-rem <option name>**: Specify one or multiple option names to be removed.

### Example

```
# list all the options of the implementation
prj_set_impl_opt -impl impl_1
# set the option myoption value to "value1"
prj_set_impl_opt myoption value1
# list the option myoption value
prj_set_impl_opt myoption
# append "value2" to the option myoption
prj_set_impl_opt -append myoption value2
# remove the option
prj_set_impl_opt -rem myoption
```

### See Also

- ▶ ["Radiant Software Project Tcl Commands" on page 1796](#)

## prj\_set\_opt

List, set or remove a project option

### Syntax

```
prj_set_opt: List all the options in the current project
prj_set_opt <option name> [<option value list>]: List or
set the option value
prj_set_opt -append <option name> <option value>: Append
a value to the specified option value
prj_set_opt -rem <option name>: Remove the options of
the current project"
```

### Arguments

- ▶ **<option name>**: Specify the project option name to be listed, set or removed.
- ▶ **<option value>**: Specify the option value.
- ▶ **<option value list>**: Specify the one or multiple option values. If not specified, it lists the option value instead (optional).
- ▶ **-append <option name> <option value>**: Append the specified value to current option value (optional).
- ▶ **-rem <option name>**: Specify one or multiple option names to be removed.

### Example

```
# list all the options in the current project
prj_set_opt
# set the option myoption value to "value1"
prj_set_opt myoption value1
# list the option myoption value
prj_set_opt myoption
# append "value2" to the option myoption
prj_set_opt -append myoption value2
# remove the option
prj_set_opt -rem myoption
```

### See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_set\_postscript

List or set user Tcl script after running the milestone.

### Syntax

```
prj_set_postscript [-impl <implement name>]
<milestone name> <script_file>
```

### Arguments

- ▶ **-impl <implement name>**: Specify the implementation name. If not specified, use the default implementation (optional).
- ▶ **- <milestone name>**: Milestone name should be 'syn', 'map', 'par', 'export'.
- ▶ **<script\_file>**: User Tcl script file path.

### Example

```
prj_set_postscript map my_map.tcl
prj_set_postscript -impl myimpl par my_par.tcl
```

**See Also**

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

**prj\_set\_prescript**

List or set user Tcl script before running the milestone.

**Syntax**

```
prj_set_prescript [-impl <implement name>]
<milestone name> <script_file>
```

**Arguments**

- ▶ **-impl <implement name>**: Specify the implementation name. If not specified, use the default implementation (optional).
- ▶ **- <milestone name>**: Milestone name should be 'syn', 'map', 'par', 'export'.
- ▶ **<script\_file>**: User Tcl script file path.

**Example**

```
prj_set_prescript map my_map.tcl
prj_set_prescript -impl myimpl par my_par.tcl
```

**See Also**

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

**prj\_set\_reference\_udb**

Set reference UDB for incremental run or disable it.

**Syntax**

```
prj_set_reference_udb {-clean | -lastrun | -postsyn <postsyn
udb> -postmap <postmap udb> -postpar <postpar udb> [-pdc <pdc>]}
```

**Arguments**

- ▶ **-clean**: Disable incremental run. This option is mutually exclusive with others.
- ▶ **-lastrun**: Incremental run based on previous run result. This option is mutually exclusive with others.
- ▶ **-postsyn <postsyn udb>**: Specify postsyn reference udb (.udb) file path. This option is mutually exclusive with '-clean' & '-lastrun'.
- ▶ **-postmap <postmap udb>**: Specify postmap reference udb (.udb) file path. This option is mutually exclusive with '-clean' & '-lastrun'.

- ▶ **-postpar <postsyn udb>**: Specify postpar reference udb (.udb) file path. This option is mutually exclusive with '-clean' & '-lastrun'.
- ▶ **-pdc <pdc>**: (Optional) Specify constraint file for map. This option is mutually exclusive with '-clean' & '-lastrun'.

### Example

```
prj_set_reference_udb -lastrun
prj_set_reference_udb -postsyn ref_udb/postsy.udb -postmap
ref_udb/postmap.udb -postpar ref_udb/postpar.udb -pdc ref_udb/
user.pdc
prj_set_reference_udb -clean
```

### See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_set\_source\_format

Set a source format.

### Syntax

```
prj_set_source_format -src <source name>
[-impl <implement name>] <format>: Currently,
only Verilog or VHDL is supported"
```

### Arguments

- ▶ **-impl <implement name>**: Specify the implementation name. If not specified, use the default implementation (optional).
- ▶ **-src <source name>**: Specify the source file path to be set.
- ▶ **<format>**: Indicate source file format. Only Verilog or VHDL is supported.

### Example

```
prj_set_source_format -src "D:/my_design/counter/source/
count_attr.v" Verilog
```

### See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_set\_source\_opt

List, set, or remove a source option.

## Syntax

```
prj_set_source_opt -src <source name> [-impl <implement name>]
: List all the options in the specified source
prj_set_source_opt -src <source name> [-impl <implement name>]
<option name> [option value list]
: List or set the source's option value
prj_set_source_opt -src <source name> [-impl <implement name>]
-append <option name> <option value>
: Append a value to the specified option value
prj_set_source_opt -src <source name> [-impl <implement name>]
-rem <option name>...: Remove the options of the source
```

## Arguments

- ▶ **-src <source name>**: Specify the source file path to be set.
- ▶ **-impl <implement name>**: Specify the implementation name. If not specified, use the default implementation (optional).
- ▶ **<option name>**: Specify the option name.
- ▶ **<option value list>**: Specify the one or multiple option values. If not specified, it lists the option value instead (optional).
- ▶ **-append <option name> <option value>**: Append the specified value to current option value (optional).
- ▶ **-rem <option name>**: Specify one or multiple option names to be removed.

## Example

```
# list all the options of the source file
prj_set_source_opt -src "D:/my_design/counter/source/
count_attr.v"
# set the option myoption value to "value1"
prj_set_source_opt -src "D:/my_design/counter/source/
count_attr.v" myoption value1
# list the option myoption value
prj_set_source_opt -src "D:/my_design/counter/source/
count_attr.v" myoption
# append "value2" to the option myoption
prj_set_source_opt -src "D:/my_design/counter/source/
count_attr.v" -append myoption value2
# remove the option
prj_set_source_opt -src "D:/my_design/counter/source/
count_attr.v" -rem myoption
```

## See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_set\_strategy

Associate the strategy with the specified implementation.

## Syntax

```
prj_set_strategy [-impl <implementation name>] <strategy name>
```

## Arguments

- ▶ **-impl <implement name>**: Specify the implementation name. If not specified, use the default implementation (optional).
- ▶ **<strategy name>**: Specify strategy name associated with implementation.

## Example

```
prj_set_strategy -impl myimpl mystrategy
```

## See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_set\_strategy\_value

Set value to a strategy item

## Syntax

```
prj_set_strategy_value [-strategy <strategy name>] <option  
name=option value> ...
```

## Arguments

- ▶ **-strategy <strategy name>**: Specify the strategy name. If not specified, use the default strategy (optional).
- ▶ **<option name=option value>**: Specify one or multiple strategy option key value pair.

## Example

```
prj_set_strategy_value -strategy Strategy1  
map_ignore_sdc_error=True map_infer_gsr=True  
prj_set_strategy_value -strategy Strategy1  
par_disable_autohldtiming=True par_place_iterator=50
```

## See Also

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## prj\_set\_top\_module

Set top module in the current implementation.

**Syntax**

```
prj_set_top_module <top module>
```

**Arguments**

- ▶ **<top module>**: Specify new top module name.

**Example**

```
prj_set_top_module counter
```

**See Also**

- ▶ [“Radiant Software Project Tcl Commands” on page 1796](#)

## Non-project Commands

Non-project Tcl commands allow you to run individual tools and processes without creating or managing a full Radiant project. These commands are useful for quick, script-based operations such as compiling files, running synthesis or place-and-route on the fly, or generating outputs in standalone workflows. The following are key non-project Tcl commands.

- ▶ [Synthesis Tcl Command](#)
- ▶ [Place & Route Tcl Commands](#)
- ▶ [Physical Synthesis Tcl Commands](#)

## Synthesis Tcl Command

The **syn** command is used to run the synthesis process. You can change from project flow to a non-project flow by using the **syn\_run** command.

**Radiant Software Synthesis Tcl Command Description**

The following table provides a listing of all valid Radiant software synthesis-related Tcl command options and describes option functionality.

**Table 29: Synthesis Tcl Command**

| Command                 | Description         |
|-------------------------|---------------------|
| <a href="#">syn_run</a> | Run synthesis tool. |

## syn\_run

Run synthesis tool.

### Syntax

```
syn_run
```

### Arguments

### Example

```
syn_run
```

### See Also

► [“Synthesis Tcl Command” on page 1827](#)

## Place & Route Tcl Commands

The **par** commands are used to run the place & route process. You can run place & route results from project flow to a non-project flow by using the **par\_run** command.

### Radiant Software Place & Route Tcl Command Descriptions

The following table provides a listing of all valid Radiant software place & route-related Tcl command options and describes option functionality.

**Table 30: Place & Route Tcl Command**

| Command                         | Description                     |
|---------------------------------|---------------------------------|
| <a href="#">par_list_option</a> | List placement routing options. |
| <a href="#">par_run</a>         | Run placement routing.          |
| <a href="#">par_set_option</a>  | Set placement routing options.  |

## par\_list\_option

Lists placement and routing options.

### Syntax

```
par_list_option
```

### Example

```
par_list_option -optionA
```

### See also

► [“Place & Route Tcl Commands” on page 1828](#)

## par\_run

Runs placement and routing.

### Syntax

```
par_run
```

### Example

```
par_run
```

### See also

► [“Place & Route Tcl Commands” on page 1828](#)

## par\_set\_option

Sets placement and routing options.

### Syntax

```
par_set_option {<key> <value> ...}
```

### Example

```
par_set_option {number_of_host_machine_cores 8  
path_based_placement on}
```

### See also

► [“Place & Route Tcl Commands” on page 1828](#)

# Physical Synthesis Tcl Commands

The commands in this section are used to run and set physical synthesis options.

## Physical Synthesis Tcl Command Descriptions

The following table provides a listing of all valid Radiant software physical synthesis-related Tcl command options and describes option functionality.

**Table 31: Placement Tcl Commands**

| Command                             | Description                                     |
|-------------------------------------|-------------------------------------------------|
| <a href="#">plc_opt</a>             | Run post-placement physical synthesis.          |
| <a href="#">plc_opt_list_option</a> | List post-placement physical synthesis options. |
| <a href="#">plc_opt_set_option</a>  | Set post-placement physical synthesis.          |

## plc\_opt

Runs post-placement physical synthesis.

### Syntax

```
plc_opt
```

### Example

```
plc_opt
```

### See Also

- ▶ [“Physical Synthesis Tcl Commands” on page 1830](#)

## plc\_opt\_list\_option

Lists post-placement physical synthesis options.

### Syntax

```
plc_opt_list_option
```

### Example

```
plc_opt_list_option
```

### See Also

- ▶ [“Physical Synthesis Tcl Commands” on page 1830](#)

## plc\_opt\_set\_option

Sets post-placement physical synthesis options.

### Syntax

```
plc_opt_set_option {<key value> ... }
```

### Example

```
plc_list_option
plc_opt_set_option {sweet_spot_relocation 1
critical_instance_duplication 1}
```

### See Also

- ▶ [“Physical Synthesis Tcl Commands” on page 1830](#)

## Reveal Commands

Reveal provides a powerful set of Tcl commands that enable automated control of debug flows, from configuring analyzers to capturing and exporting trace data. These commands allow you to script common Reveal operations, integrate debug tasks into larger toolchains, and create repeatable workflows without relying on the graphical interface. The following sections describe the essential Tcl commands available in Reveal.

- ▶ [Reveal Inserter Tcl Commands](#)
- ▶ [Reveal Analyzer Tcl Commands](#)

## Reveal Inserter Tcl Commands

This section provides Reveal Inserter extended Tcl command syntax, command options, and usage examples.

### Reveal Inserter Tcl Command Descriptions

The following table provides a listing of all valid Radiant software Reveal Inserter-related Tcl command options and describes option functionality.

**Table 32: Reveal Inserter Tcl Commands**

| Command                            | Description                      |
|------------------------------------|----------------------------------|
| <a href="#">rvl_add_controller</a> | Add Controller core.             |
| <a href="#">rvl_add_core</a>       | Add Inserter core.               |
| <a href="#">rvl_add_te</a>         | Add Inserter trigger expression. |
| <a href="#">rvl_add_trace</a>      | Add Inserter trace signals.      |
| <a href="#">rvl_add_tu</a>         | Add Inserter trigger unit.       |

**Table 32: Reveal Inserter Tcl Commands**

| Command                            | Description                           |
|------------------------------------|---------------------------------------|
| <a href="#">rvl_close_project</a>  | Close Inserter project.               |
| <a href="#">rvl_del_controller</a> | Delete Controller core.               |
| <a href="#">rvl_del_core</a>       | Delete Inserter core.                 |
| <a href="#">rvl_del_te</a>         | Delete Inserter trigger expression.   |
| <a href="#">rvl_del_trace</a>      | Delete Inserter trace signal.         |
| <a href="#">rvl_del_tu</a>         | Delete inserter trigger unit.         |
| <a href="#">rvl_group_trace</a>    | Group Inserter trace signals.         |
| <a href="#">rvl_list_core</a>      | List Inserter core.                   |
| <a href="#">rvl_list_te</a>        | List Inserter trigger expression.     |
| <a href="#">rvl_list_trace</a>     | List inserter trace signals.          |
| <a href="#">rvl_list_tu</a>        | List Inserter trigger unit.           |
| <a href="#">rvl_move_trace</a>     | Move Inserter trace signals.          |
| <a href="#">rvl_new_project</a>    | Create inserter project.              |
| <a href="#">rvl_open_project</a>   | Open Inserter project.                |
| <a href="#">rvl_rename_core</a>    | Rename Inserter core.                 |
| <a href="#">rvl_rename_te</a>      | Rename Inserter trigger expression.   |
| <a href="#">rvl_rename_trace</a>   | Rename Inserter trace bus.            |
| <a href="#">rvl_rename_tu</a>      | Rename Inserter trigger unit.         |
| <a href="#">rvl_run_project</a>    | Run Inserter project.                 |
| <a href="#">rvl_save_project</a>   | Save Inserter project.                |
| <a href="#">rvl_set_controller</a> | List or set Controller options.       |
| <a href="#">rvl_set_core</a>       | Set Inserter core.                    |
| <a href="#">rvl_set_te</a>         | Set Inserter trigger expression.      |
| <a href="#">rvl_set_traceoptn</a>  | List or set Inserter trace options.   |
| <a href="#">rvl_set_trigoptn</a>   | List or set Inserter trigger options. |
| <a href="#">rvl_set_tu</a>         | Set Inserter trigger unit.            |
| <a href="#">rvl_ungroup_trace</a>  | Ungroup Inserter trace signals.       |

## rvl\_add\_controller

Command to add the Controller Core into current project.

### Syntax

```
rvl_add_controller
```

### Arguments

- ▶ **None**

### Example

```
rvl_add_controller
```

### See Also

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## rvl\_add\_core

Command to add a new core in current project.

### Syntax

```
rvl_add_core <core name>
```

### Arguments

- ▶ **<core name>**: Specify the core name.

### Example

```
rvl_add_core top_LA1
```

### See Also

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## rvl\_add\_te

Commands to add a new trigger expression to a debug core in current project.

### Syntax

```
rvl_add_te [-core <core name>] [-ram EBR|Slice] [-name <new TE  
name>] [-expression <expreesion string>]  
[-max_seq_depth <max depth>] [-max_event_count  
<max event count>]
```

### Arguments

- ▶ **-core <core name>**: Specify a core name (optional).
- ▶ **-ram EBR|Slice**: Specify the RAM type (optional).
- ▶ **-name <new TE name>**: Specify the TE name (optional).

- ▶ **-expression <expression string>**: Set Expression. A default trigger expression name will be created if it is omitted in command.
- ▶ **-max\_seq\_depth <max depth>**: Set the Max Sequence Depth (optional).
- ▶ **-max\_event\_count <max event count>**: Set the Max Event Counter (optional).

### Example

```
rvl_add_te
rvl_add_te -name TENew -expression TU1 -core top_LA0
```

### See Also

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## rvl\_add\_trace

Commands to add signals in a debug core in current project.

### Syntax

```
rvl_add_trace [-core <core name>] [-insert_at <position>]
<signals list>
```

You can specify an existing trace signal/bus name or a position number in a trace bus as the inserting position.

### Arguments

- ▶ **-core <core name>**: Specify a core name (optional)
- ▶ **-insert\_at <position>**: Specify the inserting position (optional)
- ▶ **<signals list>**: Specify signals.

### Example

```
rvl_add_trace -insert_at leds {clk2}
rvl_add_trace -insert_at leds {clkoe2 clkout1}
```

### See Also

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## rvl\_add\_tu

Commands to add a new trigger unit to a debug core in current project.

### Syntax

```
rvl_add_tu [-core <core name>] [-radix bin|oct|dec|hex]
[-name <new TU name>] <TU definition>
```

### Arguments

- ▶ **-core <core name>**: Specify a core name (optional).
- ▶ **-radix bin|oct|dec|hex**: Specify the Radix (optional).
- ▶ **-name <new TU name>**: Specify the TU name (optional).
- ▶ **TU definition**: TU definition format: "{signal list} Operator Value" (optional).  
 Operator must be "==", "!=", ">", ">=", "<", "<=", ".RE."(rising edge),  
 ".FE."(falling edge) and ".SC."(serial compare).  
 A default trigger unit name will be created if it's omitted in command.

### Example

```
rvl_add_tu -radix bin
rvl_add_tu -radix bin -name
```

### See Also

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## rvl\_close\_project

Commands to close the current reveal insert project.

### Syntax

```
rvl_close_project [-force]
```

### Arguments

- ▶ **-force**: Force to close (optional).

### Example

```
rvl_close_project -force
```

### See Also

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## rvl\_del\_controller

Commands to remove the Controller Core from current project.

**Syntax**

```
rvl_del_controller
```

**Arguments**

- ▶ None

**Example**

```
rvl_del_controller
```

**See Also**

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

**rvl\_del\_core**

Commands to remove an existing core from current project.

**Syntax**

```
rvl_del_core <core name>
```

**Arguments**

- ▶ **<core name>**: Specify the core name.

**Example**

```
rvl_del_core top_LA1
```

**See Also**

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

**rvl\_del\_te**

Commands to delete an existing trigger expression in a debug core in current project.

**Syntax**

```
rvl_del_te [-core <core name>] [TE name]
```

**Arguments**

- ▶ **-core <core name>**: Specify a core name (optional).
- ▶ **-name <TE name>**: Specify the TE name (optional).

**Example**

```
rvl_del_te TE3
```

**See Also**

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

**rvl\_del\_trace**

Commands to delete trace signals in a debug core in current project

**Syntax**

```
rvl_del_trace [-core <core name>] <signals list>
```

**Arguments**

- ▶ **-core <core name>**: Specify a core name (optional).
- ▶ **<signals list>**: Specify signals.

**Example:**

```
rvl_del_trace {clk2}
```

**See Also**

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

**rvl\_del\_tu**

Commands to delete an existing trigger unit in a debug core in current project.

**Syntax**

```
rvl_del_tu [-core <core name>] <TU name>
```

**Arguments**

- ▶ **-core <core name>**: Specify a core name (optional).
- ▶ **<TU name>**: Specify the TU name (optional).

**Example**

```
rvl_del_tu tuNew
```

**See Also**

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## rvl\_group\_trace

Commands to group specified trace signals in a debug core in current project into a bus.

### Syntax

```
rvl_group_trace [-core <core name>] -bus <bus name> <signals  
list>
```

### Arguments

- ▶ **-core <core name>**: Specify a core name (optional).
- ▶ **-bus <bus name>**: Specify a bus name.
- ▶ **<signals list>**: Specify signals.

### Example

```
rvl_group_trace -bus BusNew {clkout1 clkoe2}
```

### See Also

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## rvl\_list\_core

Commands to list the default core in current project.

### Syntax

```
rvl_list_core
```

### Arguments

- ▶ **None**

### Example

```
rvl_list_core
```

### See Also

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## rvl\_list\_te

Commands to list all trigger expressions in a debug core in current project.

### Syntax

```
rvl_list_te [-core <core name>]
```

### Arguments

- ▶ **-core <core name>**: Specify a core name (optional).

### Example

```
rvl_list_te
```

### See Also

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## rvl\_list\_trace

Commands to list all trace signals in a debug core in current project

### Syntax

```
rvl_list_trace [-core <core name>]
```

### Arguments

- ▶ **-core <core name>**: Specify a core name (optional).

### Example

```
rvl_list_trace
```

### See Also

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## rvl\_list\_tu

Commands to list all trigger unit in a debug core in current project.

### Syntax

```
rvl_list_tu [-core <core name>]
```

### Arguments

- ▶ **-core <core name>**: Specify a core name (optional).

### Example

```
rvl_list_tu
```

**See Also**

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## **rvl\_move\_trace**

Commands to move and rearrange the order of signals in a debug core in current project.

**Syntax**

```
rvl_move_trace [-core <core name>] [-move_to <position>]  
<signals list>
```

You can specify an existing trace signal/bus name or a position number in a trace bus as the new position.

**Arguments**

- ▶ **-core <core name>**: Specify a core name (optional).
- ▶ **-move\_to <position>**: Specify the new position (optional).
- ▶ **<signals list>**: Specify signals.

**Example**

```
rvl_move_trace -move_to clkoe2 {clkout1}
```

**See Also**

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## **rvl\_new\_project**

Commands to create a new Reveal Inserter project.

**Syntax**

```
rvl_new_project [-overwrite <new rvl file name>]  
[-stage presyn|postsyn|postpar]
```

**Arguments**

- ▶ **-overwrite <new rvl file name>**: Specify project name (optional).
- ▶ **-stage presyn|postsyn|postpar**: Specify the Debug Stage.

**Example**

```
rvl_new_project -overwrite newRvl -stage presyn  
rvl_new_project -stage presyn
```

**See Also**

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## rvl\_open\_project

Commands to open a Reveal Inserter project file.

**Syntax**

```
rvl_open_project <reveal project file>
```

**Arguments**

- ▶ **<reveal project file>**: Specify the Reveal Inserter project file.

**Example**

```
rvl_open_project newRvl.rvl
```

**See Also**

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## rvl\_rename\_core

Commands to rename an existing core in current project.

**Syntax**

```
rvl_rename_core <core name> <new name>
```

**Arguments**

- ▶ **<core name>**: Specify existing core name.
- ▶ **<new name>**: Specify the new core name.

**Example**

```
rvl_rename_core top_LA1 new_LA
```

**See Also**

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## rvl\_rename\_te

Commands to rename an existing trigger expression in a debug core in current project.

### Syntax

```
rvl_rename_te [-core <core name>] <old name> <new name>
```

### Arguments

- ▶ **-core <core name>**: Specify a core name (optional).
- ▶ **<old name>**: Specify the old name.
- ▶ **<new name>**: Specify the new name.

### Example

```
rvl_rename_te TE2 TENew
```

### See Also

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## rvl\_rename\_trace

Commands to change the name of a trace bus in a debug core in current project.

### Syntax

```
rvl_rename_trace [-core <core name>] -bus <bus name> <new bus name>
```

### Arguments

- ▶ **-core <core name>**: Specify a core name (optional).
- ▶ **-bus <bus name>**: Specify the existing bus.
- ▶ **<new bus name>**: Specify the new bus name.

### Example

```
rvl_rename_trace -bus leds newBus
```

### See Also

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## rvl\_rename\_tu

Commands to rename an existing trigger unit in a debug core in current project.

### Syntax

```
rvl_rename_tu [-core <core name>] <old name> <new name>
```

### Arguments

- ▶ **-core <core name>**: Specify a core name (optional).
- ▶ **<old name>**: Specify the old name.
- ▶ **<new name>**: Specify the new name.

### Example

```
rvl_rename_tu tul tul_new
```

### See Also

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## rvl\_run\_project

Commands to run inserting debug core task or DRC checking on the current reveal insert project.

### Syntax

```
rvl_run_project [-save] [-saveAs <file_name>] [-overwrite] [-drc] [-insert_core <core_name>]...
```

### Arguments

- ▶ **-save**: Save the project before run command (optional).
- ▶ **-saveAs**: Save as a different file before run command (optional).
- ▶ **-overwrite**: Overwrite the existing file if the saved as to file exists already.
- ▶ **-drc**: Run DRC checking only (optional).
- ▶ **-insert\_core <core\_name>**: Specify the core to be inserted.

All cores will be inserted if none is specified.

### Example

```
rvl_run_project
rvl_run_project -drc
rvl_run_project -save
```

**See Also**

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

**rvl\_save\_project**

Commands to save the current reveal insert project.

**Syntax**

```
rvl_save_project [-overwrite <reveal project file>]
```

**Arguments**

- ▶ **-overwrite <reveal project file>**: Specify project name (optional).

**Example**

```
rvl_save_project newRvl.rvl
```

**See Also**

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

**rvl\_set\_controller**

Commands to list or set options of Controller items in current project.

**Syntax**

```
rvl_set_controller [-item LED|Switch|Register|PLL1|PLL2|...]
                  [-set_opt [Insert=on|off] [Width=1|2|3|...|32]]
                  [-set_sig [SWn=signal] [LEDn=signal] [Clock=clk_signal]
                  [Clock_enable=en_signal]
                  [Wr_Rdn=wr_rdn_signal] [Address=addr_bus]
                  [WData=wdata_bus] [RData=rdata_bus]]
```

**Arguments**

- ▶ **-item LED|Switch|Register|PLL1|PLL2|...**: Specify item to be set (optional).
- ▶ **-set\_opt [Insert=on|off] [Width=1|2|3|...|32]**
  - ▶ **Insert=on|off**: Insert the item which specified by -item (optional).
  - ▶ **Width=1|2|3|...|32**: Set width for LED and Switch (optional).
- ▶ **-set\_sig [SWn=signal] [LEDn=signal] [Clock=clk\_signal] [Clock\_enable=en\_signal] [Wr\_Rdn=wr\_rdn\_signal] [Address=addr\_bus] [WData=wdata\_bus] [RData=rdata\_bus]**
  - ▶ **SWn=signal**: Specify the signal where n=1 to Width for Switch (optional).

- ▶ **LEDn=signal**: Specify the signal where n=1 to Width for LED (optional).
- ▶ **Clock=clk\_signal**: Specify the signal for Register (optional).
- ▶ **Clock\_enable=en\_signal**: Specify the signal for Clock\_enable of Register (optional).
- ▶ **Wr\_Rdn=wr\_rdn\_signal for Register**: Specify the signal for Wr\_Rdn of Register.
- ▶ **Address=addr\_bus**: Specify the Address for Wr\_Rdn of Register.
- ▶ **WData=wdata\_bus**: Specify the WData for Register (optional).
- ▶ **RData=rdata\_bus**: Specify the RData for Register (optional).

**Example**

```
rvl_set_controller -item PLL1 -set_opt {insert=on}  
rvl_set_controller -item Switch -del SW2  
rvl_set_controller -item Switch -set_sig {SW0=clkoe1}
```

**See Also**

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## rvl\_set\_core

Commands to set a core as the default core in current project.

**Syntax**

```
rvl_set_core [<core name>]
```

**Arguments**

- ▶ **<core name>**: Specify the core name (optional).

**Example**

```
rvl_set_core
```

**See Also**

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## rvl\_set\_te

Commands to change an existing trigger expression in a debug core in current project.

**Syntax**

```
rvl_set_te [-core <core name>] [-ram <EBR|Slice>]
[-expression <expression string>] [-max_seq_depth <max depth>]
[-max_event_count <max event count>] <TE name>
```

### Arguments

- ▶ **-core <core name>**: Specify a core name (optional).
- ▶ **-ram <EBR|Slice>**: Specify the RAM type (optional).
- ▶ **-expression <expression string>**: Set Expression (optional).
- ▶ **-max\_seq\_depth <max depth>**: Set the Max Sequence Depth (optional).
- ▶ **-max\_event\_count <max event count>**: Set the Max Event Counter (optional).
- ▶ **-name <TE name>**: Specify the TE name (optional).

### Example

```
rvl_set_te -ram EBR TE
rvl_set_te -expression tul TE
rvl_set_te -max_seq_depth 8 TE
rvl_set_te -max_event_count 32 TE
```

### See Also

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## rvl\_set\_traceoptn

Commands to list or set trace options of a debug core in current project.

### Syntax

```
rvl_set_traceoptn [-core <core name>]
[SampleClk = <signal name>]
[SampleEnable = on|off]
[SampleEnableSig = <signal name>]
[SampleEnablePri = Active_Low|Active_High]
[BufferDepth = 16|32|...|65536]
[Implementation = EBR|DRAM]
[Timestamp = on|off]
[TimestampBits = <bits>]
[CaptureMode = single|multiple]
[MinimumSamplesPerTrigger = 8|16|32|64|128]
[IncludeTrigger = on|off]
```

### Arguments

- ▶ **-core <core name>**: Specify a core name (optional).
- ▶ **SampleClk = <signal name>**: Specify the Sample Clock (optional).
- ▶ **SampleEnable = on|off**: Enable the Sample (optional).

- ▶ **SampleEnableSig = <signal name>**: Specify the signal for Sample (optional). (Depends on whether SampleEnable is on.)
- ▶ **SampleEnablePri = Active\_Low|Active\_High**: Specify the mode of Sample (optional). (depend on SampleEnable is on)
- ▶ **BufferDepth = 16|32|...|65536**: Specify the Buffer Depth (optional).
- ▶ **Implementation = EBR|DRAM**: Specify the mode of Implementation (optional).
- ▶ **Timestamp = on|off**: Enable the Timestamp (optional).
- ▶ **TimestampBits = <bits>**: Specify the Bits of Timestamp, which must be in the range from (BufferDepth bits + 1) to 63 (optional). (depend on CaptureMode is multiple and BufferDepth)
- ▶ **CaptureMode = single|multiple**: Specify the Capture Mode (optional).
- ▶ **MinimumSamplesPerTrigger = 8|16|32|64|128**: Specify the minimum samples per trigger (optional). (depend on CaptureMode is multiple and BufferDepth)
- ▶ **IncludeTrigger = on|off**: Enable to include trigger signals in trace data (optional).

### Example

```
rvl_set_traceoptn
rvl_set_traceoptn CaptureMode=multiple
rvl_set_traceoptn MinimumSamplesPerTrigger=16
rvl_set_traceoptn SampleEnableSig=dn31
rvl_set_traceoptn TimestampBits=63
```

### See Also

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## rvl\_set\_trigoptn

Commands to list or set trigger options of a debug core in current project.

### Syntax

```
rvl_set_trigoptn [-core <core name>]
    [DefaultRadix = bin|oct|dec|hex]
    [EventCounter = on|off]
    [CounterValue = 2|4|8|16|...|65536]
    [TriggerOut = on|off]
    [OutNetType = IO|NET|BOTH]
    [OutNetName = <net name>]
    [OutNetPri = Active_Low|Active_High]
    [OutNetMPW = <pulse number>]
```

### Arguments

- ▶ **-core <core name>**: Specify a core name (optional).

- ▶ **DefaultRadix = bin|oct|dec|hex**: Specify the default Radix (optional).
- ▶ **EventCounter = on|off**: Enable the Event Counter (optional).
- ▶ **CounterValue = 2|4|8|16|...|65536**: Specify the value of Counter (optional). (depend on EventCounter is on)
- ▶ **TriggerOut = on|off**: Enable the Trigger Out (optional).
- ▶ **OutNetType = IO|NET|BOTH**: Specify the Net Type (optional). (depend on TriggerOut is on)
- ▶ **OutNetName = <net name>**: Specify the Net Name (optional). (depend on TriggerOut is on)
- ▶ **OutNetPri = Active\_Low|Active\_High**: Specify the Polarity mode (optional). (depend on TriggerOut is on)
- ▶ **OutNetMPW = <pulse number>**: Specify the Net Type (optional). (depend on TriggerOut is on)

### Example

```
rvl_set_trigoptn
rvl_set_trigoptn TriggerOut=on
rvl_set_trigoptn OutNetMPW=1
```

### See Also

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## rvl\_set\_tu

Commands to set a trigger unit in a debug core in current project.

### Syntax

```
rvl_set_tu [-core <core name>] [-radix bin|oct|dec|hex]
-name <TU name> [-add_sig <signal list>] [-del_sig
<signal list>] [-set_sig <signal list>]
[-expr <TU definition>] [-op <operator>] [-val <value>]
```

### Arguments

- ▶ **-core <core name>**: Specify a core name (optional).
- ▶ **-radix bin|oct|dec|hex**: Specify the Radix (optional).
- ▶ **-name <TU name>**: Specify the TU name (optional).
- ▶ **-add\_sig <signal list>**: Add signals (optional).
- ▶ **-del\_sig <signal list>**: Delete signals (optional).
- ▶ **-set\_sig <signal list>**: Set signals (optional).
- ▶ **-expr <TU definition>**: Define the TU Expression (optional). TU definition format: "{signal list} Operator Value"

- ▶ **-op <operator>**: Define the TU Operator (optional). Operator must be "=", "!=", ">", ">=", "<", "<=", ".RE."(rising edge), ".FE."(falling edge) and ".SC."(serial compare)
- ▶ **-val <value>**: Set value for Operator (optional).

### Example

```
rvl_set_tu -name fff -radix Oct
rvl_set_tu -name fff -op .RE.
rvl_set_tu -name fff -val 2
```

### See Also

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

## rvl\_ungroup\_trace

Commands to ungroup trace signals in a trace bus in a debug core in current project.

### Syntax

```
rvl_ungroup_trace [-core <core name>] <bus name>
```

### Arguments

- ▶ **-core <core name>**: Specify a core name (optional).
- ▶ **<bus name>**: Specify a bus name.

### Example

```
rvl_ungroup_trace BusNew
```

### See Also

- ▶ [“Reveal Inserter Tcl Commands” on page 1831](#)

# Reveal Analyzer Tcl Commands

This section provides Reveal Analyzer extended Tcl command syntax, command options, and usage examples.

## Reveal Analyzer Tcl Command Descriptions

The following table provides a listing of all valid Radiant software Reveal Analyzer-related Tcl command options and describes option functionality.

**Table 33: Reveal Analyzer Tcl Commands**

| Command                              | Description                           |
|--------------------------------------|---------------------------------------|
| <a href="#">rva_add_token</a>        | Add Analyzer token.                   |
| <a href="#">rva_add_tokenset</a>     | Add Analyzer token set.               |
| <a href="#">rva_close_controller</a> | Close Controller connection.          |
| <a href="#">rva_close_project</a>    | Close Analyzer project.               |
| <a href="#">rva_del_token</a>        | Delete Analyzer token.                |
| <a href="#">rva_del_tokenset</a>     | Delete Analyzer token set.            |
| <a href="#">rva_export_project</a>   | Export Analyzer waveform.             |
| <a href="#">rva_export_tokenset</a>  | Export Analyzer token set.            |
| <a href="#">rva_get_trace</a>        | List Analyzer trace signals.          |
| <a href="#">rva_import_tokenset</a>  | Import Analyzer token set.            |
| <a href="#">rva_manualtrig</a>       | Manual Trigger to capture data.       |
| <a href="#">rva_new_project</a>      | Create Analyzer project.              |
| <a href="#">rva_open_controller</a>  | Open Controller connection.           |
| <a href="#">rva_open_project</a>     | Open Analyzer project file.           |
| <a href="#">rva_read_controller</a>  | Read data from 32-bit address in hex. |
| <a href="#">rva_rename_te</a>        | Rename Analyzer trigger expression.   |
| <a href="#">rva_rename_tu</a>        | Rename Analyzer trigger unit.         |
| <a href="#">rva_run</a>              | Run Analyzer project.                 |
| <a href="#">rva_run_controller</a>   | Run Controller command.               |
| <a href="#">rva_save_project</a>     | Save the current Analyzer project.    |
| <a href="#">rva_set_controller</a>   | Set Controller options.               |
| <a href="#">rva_set_core</a>         | Set Analyzer core.                    |
| <a href="#">rva_set_project</a>      | Set Analyzer options.                 |
| <a href="#">rvl_set_te</a>           | Set Analyzer trigger expression.      |

**Table 33: Reveal Analyzer Tcl Commands**

| Command                               | Description                                     |
|---------------------------------------|-------------------------------------------------|
| <a href="#">rva_set_token</a>         | Set Analyzer token.                             |
| <a href="#">rva_set_tokenset</a>      | Set Analyzer token set.                         |
| <a href="#">rva_set_trigoptn</a>      | Set Analyzer trigger options.                   |
| <a href="#">rva_set_tu</a>            | Set Analyzer trigger unit.                      |
| <a href="#">rva_stop</a>              | Stop Analyzer project without capturing data.   |
| <a href="#">rva_target_controller</a> | Set Controller core as target.                  |
| <a href="#">rva_write_controller</a>  | Write Controller data to 32-bit address in hex. |

## rva\_add\_token

Adds a token with new name and value in a specific token set.

### Syntax

```
rva_add_token <tokenset name> <name=value>
```

### See Also

▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## rva\_add\_tokenset

Adds a token set.

### Syntax

```
rva_add_tokenset [-tokenset <tokenset name>]
[-bits <token bits>] [-token <name=value>]
```

### Arguments

- ▶ **tokenset**: Sets the token set name
- ▶ **-bits**: Sets the token set bits
- ▶ **-token**: Add extra token

If no arguments are specified, add a token set with default name and bits.

### See Also

▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## **rva\_close\_controller**

Closes Controller connection to Lattice device after read/write has finished.

### **Syntax**

```
rva_close_controller
```

### **See Also**

▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## **rva\_close\_project**

Closes the current Reveal Analyzer project.

### **Syntax**

```
rva_close_project
```

### **See Also**

▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## **rva\_del\_token**

Deletes a specific token in a token set.

### **Syntax**

```
rva_del_token <tokenset name> <token name>
```

### **See Also**

▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## **rva\_del\_tokenset**

Deletes the specific token set.

### **Syntax**

```
rva_del_tokenset <tokenset name>
```

### **See Also**

▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## **rva\_export\_project**

Exports waveform in VCD or TEXT from the current Reveal Analyzer project.

### **Syntax**

```
rva_export_project <-vcd|-txt> <file name> [option]
```

### **Arguments**

- ▶ **-vcd:** <file name> [module <title>]
- ▶ **-txt:** <file name> [-siglist <signal list>]

By default, the module title is "<unknown>" and all signals are exported.

### **See Also**

- ▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## **rva\_export\_tokenset**

Exports all token set to a specific file.

### **Syntax**

```
rva_export_tokenset <file name>
```

### **See Also**

- ▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## **rva\_get\_trace**

Lists all trace signals in Analyzer core.

### **Syntax**

```
rva_get_trace
```

### **See Also**

- ▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## rva\_import\_tokenset

Imports and merges all token set from a specific file.

### Syntax

```
rva_import_tokenset <file name>
```

### See Also

- ▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## rva\_manualtrig

Manually triggers Reveal Analyzer to capture data.

### Syntax

```
rva_manualtrig
```

### See Also

- ▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## rva\_new\_project

Creates a new Reveal Analyzer project.

### Syntax

```
rva_new_project -rva <file name> -rvl <file name> -dev <val> -  
cable <val> -port <val> [-xcf <file name>]
```

### Arguments

- ▶ **-rva**: Set the new rva file name
- ▶ **-rvl**: Set the associated rvl file name
- ▶ **-dev**: Set the device name
- ▶ **-cable**: Set type of cable as USB or USB2
- ▶ **-port**: Set logical port of cable as integer
- ▶ **-xcf**: Optional xcf file name for multiple device chain

### See Also

- ▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## **rva\_open\_controller**

Open Controller connection to Lattice device before read/write began.

### **Syntax**

```
rva_open_controller
```

### **See Also**

▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## **rva\_open\_project**

Opens Controller connection to Lattice device before read/write begins.

### **Syntax**

```
rva_open_project <rva file name>
```

### **See Also**

▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## **rva\_read\_controller**

Reads data from 32bit address in hex.

### **Syntax**

```
rva_read_controller -addr <addr32>
```

### **See Also**

▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## **rva\_rename\_te**

Renames an existing trigger expression in a debug core in current project.

### **Syntax**

```
rva_rename_te <name> <new name>
```

### **See Also**

▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## rva\_rename\_tu

Renames an existing trigger unit in a debug core in the current project.

### Syntax

```
rva_rename_tu <name> <new name>
```

### See Also

► [“Reveal Analyzer Tcl Commands” on page 1850](#)

## rva\_run

Runs Reveal Analyzer until trigger condition to capture data.

### Syntax

```
rva_run
```

### See Also

► [“Reveal Analyzer Tcl Commands” on page 1850](#)

## rva\_run\_controller

Runs command for Virtual LED, Virtual Switch, User Memory, and Hard IP.

Runs command for User Control Register and User Status Register.

### Syntax

```
rva_run_controller -read_led|-read_switch|-write_switch  
<data>|-dump_memfile <mem_file>|-load_memfile <mem_file>|  
-read_ip <ipname>|-write_ip <ipname>|-eye_monitor <ipname>|  
-read_status <regname>|-read_control <regname>|-write_control  
<regname> -data <data>|-toggle_control <regname>|  
-dump_status <reg_file>|-dump_control <reg_file>|-load_control  
<reg_file>
```

### Arguments

- **read\_led**: Reads data from Virtual LED
- **read\_switch**: Reads data from Virtual Switch
- **write\_switch**: Writes data to Virtual Switch
- **dump\_memfile**: Dumps data from User Memory to mem\_file
- **load\_memfile**: Loads data from mem\_file to User Memory
- **read\_ip**: Reads data from Hard IP register of ipname
- **write\_ip**: Writes data to Hard IP register of ipname
- **eye\_monitor**: Runs Eye-Opening Monitor for PCS channel of ipname

- ▶ **read\_status**: Reads data from User Status Register of regname
- ▶ **read\_control**: Reads data from User Control Register of regname
- ▶ **write\_control**: Writes data to User Control Register of regname
- ▶ **toggle\_control**: Toggles data bit in User Control Register of regname
- ▶ **dump\_status**: Dumps data from User Status Register to reg\_file
- ▶ **dump\_control**: Dumps data from User Control Register to reg\_file

#### See Also

- ▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## rva\_save\_project

Saves the current Reveal Analyzer project.

#### Syntax

```
rva_save_project [<new rva file name>]
```

#### See Also

- ▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## rva\_set\_controller

Sets the options for Controller core.

#### Syntax

```
rva_set_controller [-option <value>]
```

- ▶ **cable\_type**: Sets type of cable as USB or USB2.
- ▶ **cable\_port**: Sets logical port of cable as integer.

If no arguments are specified, return list of options and values.

```
rva_set_controller -hard_ip <ipname> [-option <value>]
```

- ▶ **hard\_ip**: Sets options of DPHY1, DPHY2, I2CFIFO1, SGMIIHDR1, SGMIIHDR2, PCIELL1, PCSCH1 to PCSCH8

If no option/value specified, then return list of options and values.

#### Arguments

- ▶ **DPHY1, DPHY2 options and values:**
  - ▶ **high\_speed\_select**: Sets value as "1.5Gbps and below", "2.5Gbps"
  - ▶ **bypass\_pll\_clock**: Sets value as Enabled, Disabled
  - ▶ **pll\_cn\_counter**: Sets value as integer from 0 to 31

- ▶ **pll\_cm\_counter**: Sets value as integer from 0 to 255
- ▶ **pll\_co\_counter**: Sets value as integer from 0 to 7
- ▶ **I2CFIFO1 options and values:**
  - ▶ **generic\_call\_response**: Sets value as Enabled, Disabled
  - ▶ **sda\_input\_delay**: Sets value as Enabled, Disabled
  - ▶ **sda\_output\_delay**: Sets value as Enabled, Disabled
  - ▶ **fifo\_mode\_select**: Sets value as "Register Mode", "FIFO Mode"
  - ▶ **fifo\_clock\_stretching**: Sets value as Enabled, Disabled
  - ▶ **fifo\_almost\_full\_value**: Sets value as integer from 0 to 31
  - ▶ **fifo\_sleep\_clock**: Sets value as Enabled, Disabled
  - ▶ **slave\_address\_match\_wakeup**: Sets value as Enabled, Disabled
  - ▶ **fifo\_almost\_full\_wakeup**: Sets value as Enabled, Disabled
  - ▶ **master\_read\_complete\_wakeup**: Sets value as Enabled, Disabled
- ▶ **SGMIICDR1, SGMIICDR2 options and values:**
  - ▶ **cdr\_loss\_of\_lock**: Sets value as "Lock=+/-1000ppm x2 Unlock=+/-1500ppm x2", "Lock=+/-2000ppm x2 Unlock=+/-2500ppm x2", "Lock=+/-4000ppm Unlock=+/-7000ppm", "Lock=+/-300ppm Unlock=+/-450ppm"
  - ▶ **loopback\_control**: Sets value as Disabled, "Bit Clock to IO", "Serial Data to IO"
- ▶ **PCIELL1 options and values:**
  - ▶ **swing\_control**: Sets value as full, reduced
- ▶ **PCSCH1 to PCSCH8 options and values:**
  - ▶ **tx\_differential\_amplitude**: Sets value as 1000mV, 900mV, 800mV, 700mV, 600mV, 500mV, 400mV, 300mV, 200mV, 100mV, 0mV
  - ▶ **tx\_output\_termination**: Sets value as "100 ohm", "150 ohm"
  - ▶ **tx\_postcursor\_ratio**: Sets value as integer from 0 to 63 of 128th
  - ▶ **tx\_precursor\_ratio**: Sets value as integer from 0 to 63 of 128th
  - ▶ **tx\_invert\_polarity**: Sets value as on, off
  - ▶ **rx\_input\_termination**: Set value as "100 ohm", "150 ohm"
  - ▶ **rx\_equalization**: Sets value as "RL2plus 8GT/s", "RL2plus 5GT/s", "RL2plus 2.5GT/s", "SS\_LMS 8GT/s", "SS\_LMS 5GT/s", "SS\_LMS 2.5GT/s"
  - ▶ **rx\_invert\_polarity**: Sets value as on, off
  - ▶ **loopback\_mode**: Set value as Disabled, "PMA Near-End Serial Loopback", "PMA Far-End Parallel Loopback", "8B/10B PCS Near-End Parallel Loopback", "8B/10B PCS Far-End Parallel Loopback", "64B/66B PCS Loopback Path A", "64B/66B PCS Loopback Path B", "64B/66B PCS Loopback Path C"
  - ▶ **reset\_tx\_mpcs**: Sets value as on, off

- ▶ **reset\_rx\_mpcs**: Sets value as on, off
- ▶ **reset\_tx\_pll**: Sets value as on, off
- ▶ **reset\_rx\_pll**: Sets value as on, off
- ▶ **force\_tx\_driver**: Sets value as on, off
- ▶ **force\_rx\_driver**: Sets value as on, off
- ▶ **eye\_quality**: Sets quality of eye diagram as high, normal, low

#### See Also

- ▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## rva\_set\_core

Sets a core as the default core in the current project.

#### Syntax

```
rva_set_core [-name <name>] [-run <on|off>]
```

#### Arguments

- ▶ **name**: Selects core. This is needed for other actions.
  - ▶ **run**: Turns the run option on or off for core.
- If no arguments are specified, return list of core.

#### See Also

- ▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## rva\_set\_project

Sets the current Reveal Analyzer project options.

#### Syntax

```
rva_set_project [-frequency <val>] [-period <val>] [-tckdelay  
<val>] [-cabletype <val>] [-cableport <val>]
```

#### Arguments

- ▶ **frequency**: Sets the frequency value for sample clock in MHz
- ▶ **period**: Sets the period value for sample clock in ns or ps
- ▶ **tckdelay**: Sets the TCK Divider Setting upto 30
- ▶ **cabletype**: Sets the type of cable. Values must be "LATTICE", "USB", "USB2"

- ▶ **cableport**: Sets the port number as integer  $\geq 0$

#### See Also

- ▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## rva\_set\_te

Changes an existing trigger expression in a debug core in current project.

#### Syntax

```
rva_set_te [-name <name>] [-expression <expression list>] [-enable <on|off>]
```

#### Arguments

- ▶ **name**: Selects TE. If no options are specified, return options and values for the selected TE.
- ▶ **expression**: Sets TE expression
- ▶ **enable**: Enables/disables TE  
If no arguments are specified, return list of TE.

#### See Also

- ▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## rva\_set\_token

Selects a specific token in a specific token set.

#### Syntax

```
rva_set_token <tokenset name> <token name> -name <new token name> -value <new token value>
```

#### Arguments

- ▶ **name**: Sets token name
- ▶ **value**: Sets token value

#### See Also

- ▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## rva\_set\_tokenset

Selects a specific token set.

### Syntax

```
rva_set_tokenset <tokenset name> [-name <new token set name>]  
[-bits <new token bits>]
```

### Arguments

- ▶ **name:** Renames a token set
- ▶ **bits:** Sets number of bits in token

### See Also

- ▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## rva\_set\_trigoptn

Sets trigger options of Analyzer core in the current project.

### Syntax

```
rva_set_trigoptn [-teall <AND|OR>] [-finalcounter <on|off>]  
[-finalcountervalue <val>] [-samples <val>]  
[-numtriggers <val>] [-position <pre|center|post|val>]
```

### Arguments

- ▶ **teall:** Sets AND ALL or OR ALL for all TE
  - ▶ **finalcounter:** Turns final trigger counter on/off
  - ▶ **finalcountervalue:** Sets final trigger counter value
  - ▶ **samples:** Sets number of samples to capture
  - ▶ **numtriggers:** Sets number of triggers to capture
  - ▶ **position:** Sets trigger position to pre-selected or user value
- If no arguments specified, then return list of options.

### See Also

- ▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## rva\_set\_tu

Sets a trigger unit in a debug core in current project.

### Syntax

```
rva_set_tu [-name <name>] [-operator {== | != | > | >= | < |  
<= | "rising edge" | "falling edge"}}] [-value <value>] [-radix  
{bin | oct | dec | hex | <token>}]
```

### Arguments

- ▶ **name:** Selects TU. If no options are specified, return options and value for the selected TU.
  - ▶ **operator:** Sets TU comparison operator
  - ▶ **value:** Sets TU value
  - ▶ **radix:** Sets TU radix
- If no arguments are specified, return list of TU.

### See Also

- ▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## rva\_stop

Stops Reveal Analyzer without capturing data.

### Syntax

```
rva_stop
```

### See Also

- ▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## rva\_target\_controller

Sets Controller core as target before read/write begins.

### Syntax

```
rva_target_controller
```

### See Also

- ▶ [“Reveal Analyzer Tcl Commands” on page 1850](#)

## rva\_write\_controller

Writes data to 32bit address in hex.

### Syntax

```
rva_write_controller -addr <addr32> -data <data>
```

### See Also

► [“Reveal Analyzer Tcl Commands” on page 1850](#)

## Power Calculator Tcl Commands

This section provides Power Calculator extended Tcl command syntax, command options, and usage examples.

### Power Calculator Tcl Command Descriptions

The following table provides a listing of all valid Radiant software Power Calculator-related Tcl command options and describes option functionality.

**Table 34: Power Calculator Tcl Commands**

| Command                              | Description                                          |
|--------------------------------------|------------------------------------------------------|
| <a href="#">pwc_add_inactiveimpl</a> | Add inactive implementation name.                    |
| <a href="#">pwc_add_ipblock</a>      | Add IP Block row.                                    |
| <a href="#">pwc_calculate</a>        | Run power calculation for current project.           |
| <a href="#">pwc_close_project</a>    | Close the current project.                           |
| <a href="#">pwc_gen_csvreport</a>    | Generate CSV report and write to file.               |
| <a href="#">pwc_gen_htmlreport</a>   | Generate HTML report and write to file.              |
| <a href="#">pwc_gen_report</a>       | Generate text report and write to file.              |
| <a href="#">pwc_new_project</a>      | Create a new project.                                |
| <a href="#">pwc_open_project</a>     | Open a project file.                                 |
| <a href="#">pwc_remove_ipblock</a>   | Remove IP Block row.                                 |
| <a href="#">pwc_save_project</a>     | Save the current project.                            |
| <a href="#">pwc_set_af</a>           | Set activity factor.                                 |
| <a href="#">pwc_set_afpervcd</a>     | Open vcd file and set frequency and activity factor. |
| <a href="#">pwc_set_ambienttemp</a>  | Set ambient temperature value.                       |
| <a href="#">pwc_set_device</a>       | Set device information.                              |
| <a href="#">pwc_set_estimation</a>   | Set estimated routing option.                        |
| <a href="#">pwc_set_freq</a>         | Set frequency.                                       |

**Table 34: Power Calculator Tcl Commands**

| Command                               | Description                                                  |
|---------------------------------------|--------------------------------------------------------------|
| <a href="#">pwc_set_ipblock</a>       | Set IP Block row.                                            |
| <a href="#">pwc_set_junctiontemp</a>  | Set junction temperature value.                              |
| <a href="#">pwc_set_powerscreen</a>   | Set power screen type.                                       |
| <a href="#">pwc_set_processtype</a>   | Set device power process type.                               |
| <a href="#">pwc_set_supply</a>        | Set multiplication factor and voltage of named power supply. |
| <a href="#">pwc_set_thetaja</a>       | Set thermal profile.                                         |
| <a href="#">pwc_set_userenteredtj</a> | Set user entered Tj value.                                   |

## pwc\_add\_inactiveimpl

Commands to add inactive implementation name.

### Syntax

```
pwc_add_inactiveimpl [<implementation name>]
```

### Arguments

- ▶ **<implementation name>**: This option specifies implementation name.

### Example

```
pwc_add_inactiveimpl impl1
```

### See Also

- ▶ [“Power Calculator Tcl Commands” on page 1863](#)

## pwc\_add\_ipblock

Commands to add IP Block row.

### Syntax

```
pwc_add_ipblock -iptype <iptype name>
```

### Arguments

- ▶ **iptype <iptype name>**: This option specifies IP type.

### Example

```
pwc_add_ipblock -iptype Logic
```

**See Also**

▶ [“Power Calculator Tcl Commands” on page 1863](#)

**pwc\_calculate**

Commands to run power calculation for current project.

**Syntax**

```
pwc_calculate
```

**Example**

```
pwc_calculate
```

**See Also**

▶ [“Power Calculator Tcl Commands” on page 1863](#)

**pwc\_close\_project**

Commands to close the current project.

**Syntax**

```
pwc_close_project
```

**Example**

```
pwc_close_project
```

**See Also**

▶ [“Power Calculator Tcl Commands” on page 1863](#)

## **pwc\_gen\_csvreport**

Commands to generate CSV report and write to file.

### **Syntax**

```
pwc_gen_csvreport <report file>
```

### **Arguments**

- ▶ **<report file>**: This option specifies the report file name.

### **Example**

```
pwc_gen_csvreport test.csv
```

### **See Also**

- ▶ [“Power Calculator Tcl Commands” on page 1863](#)

## **pwc\_gen\_htmlreport**

Commands to generate HTML report and write to file.

### **Syntax**

```
pwc_gen_htmlreport <report file>
```

### **Arguments**

- ▶ **<report file>**: This option specifies the report file name.

### **Example**

```
pwc_gen_htmlreport test.html
```

### **See Also**

- ▶ [“Power Calculator Tcl Commands” on page 1863](#)

## **pwc\_gen\_report**

Commands to generate text report and write to file.

### **Syntax**

```
pwc_gen_report <report file>
```

### **Arguments**

- ▶ **<report file>**: This option specifies the report file name.

### **Example**

```
pwc_gen_report test.html
```

### **See Also**

- ▶ [“Power Calculator Tcl Commands” on page 1863](#)

## **pwc\_new\_project**

Commands to create a new project.

### **Syntax**

```
pwc_new_project <project file>
```

### **Arguments**

- ▶ **<project file>**: This option specify new project file name.

### **Examples**

```
pwc_new_project test.pcf
```

### **See Also**

- ▶ [“Power Calculator Tcl Commands” on page 1863](#)

## pwc\_open\_project

Commands to open a project file.

### Syntax

```
pwc_open_project <project file>
```

### Arguments

- ▶ **<project file>**: This option specifies the project file name.

### Example

```
pwc_open_project test.pcf
```

### See Also

- ▶ [“Power Calculator Tcl Commands” on page 1863](#)

## pwc\_remove\_ipblock

Commands to remove IP Block row.

### Syntax

```
pwc_remove_ipblock -iptype <iptype name> -matchkeys {<key1>  
<value1>}+
```

### Arguments

- ▶ **iptype <iptype name>**: This option specifies IP type.
- ▶ **matchkeys {<key1> <value1>}+**: This option specifies match keys.

### Example

```
pwc_remove_ipblock -iptype Logic -matchkeys Clk clk_1
```

### See Also

- ▶ [“Power Calculator Tcl Commands” on page 1863](#)

## pwc\_save\_project

Commands to save the current project.

### Syntax

```
pwc_save_project <project file>
```

### Arguments

- ▶ **<project\_file>**: This option specifies the project file name.

### Example

```
pwc_save_project test.pcf
```

### See Also

- ▶ [“Power Calculator Tcl Commands” on page 1863](#)

## pwc\_set\_af

Commands to set activity factor.

### Syntax

```
pwc_set_af <activity factor> [-keepClocksAF] | <activity factor>  
-iptype <iptype name> -clk <clock name>
```

### Arguments

- ▶ **<activity factor>**: This option specifies default activity factor.
- ▶ **-keepClocksAF**: This option specifies activity factor except clocks tab (optional).
- ▶ **-iptype <iptype name>**: This option is to set activity factor for given IP.
- ▶ **-clk <clock name>**: This option is to set activity factor for given IP clock name.

### Example

```
pwc_set_af 20  
pwc_set_af 30 -keepClocksAF  
pwc_set_af 40 -iptype Logic -clk clk_1
```

### See Also

- ▶ [“Power Calculator Tcl Commands” on page 1863](#)

## pwc\_set\_afpervcd

Commands to open vcd file and set frequency and activity factor.

### Syntax

```
pwc_set_afpervcd -vcd <vcd file> [-module <module name>]
```

### Arguments

- ▶ **-vcd <vcd file>**: This option specifies the vcd file name.
- ▶ **-module <module name>**: This option specifies the module name (optional).

### Example

```
pwc_set_afpervcd -vcf test.vcd  
pwc_set_afpervcd -vcf test.vcd -module abc
```

### See Also

- ▶ [“Power Calculator Tcl Commands” on page 1863](#)

## pwc\_set\_ambienttemp

Commands to set ambient temperature value.

### Syntax

```
pwc_set_ambienttemp <ambient temperature>
```

### Arguments

- ▶ **<ambient temperature>**: This option specifies implementation name (optional).

### Example

```
pwc_set_ambienttemp 30
```

### See Also

- ▶ [“Power Calculator Tcl Commands” on page 1863](#)

## pwc\_set\_device

Commands to set device information.

### Syntax

```
pwc_set_device -family <family name>|-device <device name>|-  
package <package name>|-speed <speed name>|-operating  
<operating name>|-part <part name>
```

### Arguments

- ▶ **-family <family name>**: This option specifies family name.
- ▶ **-device <device name>**: This option specifies device name.
- ▶ **-package <package name>**: This option specifies package name.
- ▶ **-speed <speed name>**: This option specifies speed name.
- ▶ **-operating <operating name>**: This option specifies operating name.
- ▶ **-part <part name>**: This option specifies part name.

### Example

```
pwc_set_device -family LIFCL  
pwc_set_device -device LIFCL-17  
pwc_set_device -package QFN72  
pwc_set_device -speed 8_Low-Power_1.0V  
pwc_set_device -operating Commercial  
pwc_set_device -part LIFCL-17-8SG72Cpwc_add_inactiveimpl impl1
```

### See Also

- ▶ [“Power Calculator Tcl Commands” on page 1863](#)

## pwc\_set\_estimation

Commands to set estimated routing option.

### Syntax

```
pwc_set_estimation <estimated routing option>
```

### Arguments

- ▶ **<estimated routing option>**: This option specifies estimated routing type.

### Example

```
pwc_set_estimation Low
```

**See Also**

- ▶ [“Power Calculator Tcl Commands” on page 1863](#)

**pwc\_set\_freq**

Commands to set frequency.

**Syntax**

```
pwc_set_freq <frequency>|<clock> <frequency>|-freq <frequency>
-usefreqtwr 0|1 -freqtwropt min|pref|trace
```

**Arguments**

- ▶ **<frequency>**: This option specifies default frequency.
- ▶ **<clock> <frequency>**: This option specifies clock frequency.
- ▶ **-freq <frequency>**: This option specifies frequency.
- ▶ **-usefreqtwr 0|1**: This option specifies if it is to set frequency by importing timing report or not.
- ▶ **-freqtwropt min|pref|trace**: This option specifies the selection for importing timing report.

**Example**

```
pwc_set_freq 100
pwc_set_freq clk_1 100
pwc_set_freq -freq 100 -usefreqtwr 1 -freqtwropt min
```

**See Also**

- ▶ [“Power Calculator Tcl Commands” on page 1863](#)

**pwc\_set\_ipblock**

Commands to set IP Block row.

**Syntax**

```
pwc_set_ipblock -iptype <iptype name> -matchkeys {<key1>
<value1>}+ -setkey <key> <value>
```

**Arguments**

- ▶ **-iptype <iptype name>**: This option specifies ip type.
- ▶ **-matchkeys {<key1> <value1>}+**: This option specifies match keys.
- ▶ **-setkey <key> <value>**: This option specifies key value.

**Example**

```
pwc_set_ipblock -iptype Logic -matchkeys Clk clk_1 -setkey LUT
5000
```

**See Also**

- ▶ [“Power Calculator Tcl Commands” on page 1863](#)

**pwc\_set\_junctiontemp**

Commands to set junction temperature value.

**Syntax**

```
pwc_set_junctiontemp <junction temperature>
```

**Arguments**

- ▶ **<junction temperature>**: This option specifies the junction temperature value.

**Example**

```
pwc_set_junctiontemp 60
```

**See Also**

- ▶ [“Power Calculator Tcl Commands” on page 1863](#)

**pwc\_set\_powerscreen**

Commands to set power screen type.

**Syntax**

```
pwc_set_powerscreen <power screen>
```

**Arguments**

- ▶ **<power screen>**: This option specifies power screen value.

**Example**

```
pwc_set_powerscreen P20
```

**See Also**

- ▶ [“Power Calculator Tcl Commands” on page 1863](#)

## pwc\_set\_processtype

Commands to set device power process type.

### Syntax

```
pwc_set_processtype <process type>
```

### Arguments

- ▶ **<process type>** This option specifies process type.

### Example

```
pwc_set_processtype Typical
```

### See Also

- ▶ [“Power Calculator Tcl Commands” on page 1863](#)

## pwc\_set\_supply

Commands to set multiplication factor and voltage of named power supply.

### Syntax

```
pwc_set_supply -type <type> -voltage <voltage> -dpm <dpm>
```

### Arguments

- ▶ **-type <type>**: This option specifies supply type.
- ▶ **-voltage <voltage>**: This option specifies voltage value.
- ▶ **-dpm <dpm>**: This option specifies dpm value.

### Example

```
pwc_set_supply -type Vcc -voltage 0.8 -dpm 1.5
```

### See Also

- ▶ [“Power Calculator Tcl Commands” on page 1863](#)

## pwc\_set\_thetaja

Commands to set thermal profile.

### Syntax

```
pwc_set_thetaja <theta JA>|-board <board type> -heatsink
<heatsink value>|-board <board type> -heatsink <heatsink type>
-airflow <airflow type>
```

### Arguments

- ▶ **<theta JA>**: This option specifies user defined theta JA.
- ▶ **-board <board type>**: This option specifies board type.
- ▶ **-heatsink <heatsink value>**: This option specifies custom profile heat sink value.
- ▶ **-heatsink <heatsink type>**: This option specifies heat sink type.
- ▶ **-airflow <airflow type>**: This option specifies airflow type.

### Example

```
pwc_set_thetaja 20
pwc_set_thetaja -board Medium Board -heatsink 10
pwc_set_thetaja -board Medium Board -heatsink No Heat Sink -
airflow 0 LFM
```

### See Also

- ▶ [“Power Calculator Tcl Commands” on page 1863](#)

## pwc\_set\_userenteredtj

Commands to set user entered Tj value.

### Syntax

```
pwc_set_userenteredtj 1|0
```

### Arguments

- ▶ **1**: This option specifies user entered Tj.
- ▶ **0**: This option specifies auto-computed Tj.

### Example

```
pwc_set_userenteredtj 1
```

### See Also

- ▶ [“Power Calculator Tcl Commands” on page 1863](#)

# Simulation Libraries Compilation Tcl Commands

This section provides Simulation Libraries Compilation extended Tcl command syntax and usage examples.

## Simulation Libraries Compilation Tcl Command Descriptions

The following table provides a listing of all valid Radiant software Simulation Libraries Compilation-related Tcl command options and describes option functionality.

### Note

Running `cmpl_libs` may take a long time and may cause the Radiant software to hang.

- ▶ It is recommended to run `cmpl_libs` using the Radiant Tcl Console (**Start Menu > Lattice Radiant Software > Accessories > TCL Console**).

or,

- ▶ Run `cmpl_libs.tcl` using the command line console. Refer to [Running cmpl\\_libs.tcl from the Command Line](#).

**Table 35: Simulation Libraries Compilation Tcl Command**

| Command                          | Description                                                      |
|----------------------------------|------------------------------------------------------------------|
| <code>cmpl_libs</code>           | Compile simulation library.                                      |
| <code>sim_generate_script</code> | Generate a simulation script for use with ModelSim or QuestaSim. |

This section displays the usage information of the commands:

## cmpl\_libs

The **-sim\_path** argument specifies the path to the simulation tool executable (binary) folder. This option is mandatory. Currently, only QuestaSim simulators from Mentor and Xcelium simulator from Cadence are supported.

### Note

- ▶ If you are a Windows user and prefer the `\` notation in the path, you must surround it with `{}`. And `""` or `{ }` will be needed if the path has spaces.
- ▶ To execute this script error free, Siemens Questa 2020.4 or a later version should be used for compilation.

The `-sim_vendor` argument specifies simulation vendor. This argument is optional. If you do not use this argument, Mentor is chosen by default, and the libraries are compiled for QuestaSim. If you are using QuestaSim choose `mentor` and Xcelium choose `cadence` for `-sim_vendor`.

The `-device` argument specifies the Lattice FPGA device to compile simulation libraries for. This argument is optional, and the default is to compile libraries for all the Lattice FPGA devices.

The `-target_path` argument specifies the target path, where you want the compiled libraries and `modelsim.ini` file to be located. This argument is optional, and the default target path is the current folder.

---

**Note**

- ▶ This argument is recommended if you did not change the current folder from the Radiant software startup (binary) folder, or if the current folder is write-protected.
  - ▶ If you are a Windows user and prefer the `\` notation in the path, you must surround it with `{}`. And `""` or `{ }` will be needed if the path has spaces.
- 

```
% ctpl_libs
Usage: ctpl_libs -sim_path <sim_path> [-sim_vendor
{siemens<default>|synopsys|cadence}] [-device
{iCE40UP|lifcl|lfcpx|lfcpx_rcs|lfd2nx|lfd2nx1|lfd2nx2|lfmxo5|
lfmxo5t|lfmxo5t1|lav_ate_es|lav_atg_es|lav_atx_es|lav_ate_b|ln2
_mh|ln2_ct|lav_ate|lav_atg|lav_atx|ut24c|ut24cp|all<default>}]
[-target_path <target_path>]
```

## sim\_generate\_script

The `sim_generate_script` command is used to generate the QuestaSim `qrun` argument (`.f`) template file from the current Radiant project settings, including RTL, test bench, and other files. If there is no open Radiant project, this command will fail to run.

This command does not support modifying the original file list of the Radiant project. Simulation Wizard does not call this command to generate the `qrun` argument file. If you want to modify simulation files, you can edit the `qrun` argument file manually.

---

**Note**

The `sim_generate_script` command does not launch QuestaSim as the Simulation Wizard. However, as long as QuestaSim executes the command correctly, it can generate any type of file as an extension of the script.

---

**Syntax**

```
sim_generate_script -top <top module> [-qrun <true|false>]
[-stage <rtl|postsyn|postroute|timing>] [-inst <instance name>]
[-debug] [-run <timesteps><time_units>|0]
[-t <multiplier><time_unit>] [-no_gui] [-w] -o <do file>
```

**Arguments**

- ▶ **-top:** top module for simulation.
- ▶ **-qrun:** invoke QuestaSim with Qrun (optional).
- ▶ **-stage:** valid types are 'rtl', 'postsyn', 'postroute', 'timing'. 'rtl' is default (optional).
- ▶ **-inst:** specify instance for the associated SDF file (optional).
- ▶ **-debug:** apply full debug mode to the simulator (optional).
- ▶ **-run:** specify the number of timesteps for the simulation to run (optional). valid <time\_unit> must be one of the fs, ps, ns, us, ms, sec. '0' means 'run -all'.
- ▶ **-t:** specify the simulator time resolution (optional). <multiplier> is optional. <time\_unit> must be one of the fs, ps, ns, us, ms, sec.
- ▶ **-no\_gui:** runs scripted batch simulations (optional).
- ▶ **-w:** allow to overwrite existed simulation do file or arguments file (optional).
- ▶ **-o:** specify simulation do file path or arguments file path.

**Example**

```
sim_generate_script -top test -run 0 -w -o test.f
sim_generate_script -top count -stage rtl -o count.f
```

**See Also**

- ▶ [“Simulation Libraries Compilation Tcl Commands” on page 1876](#)

**Simulation Libraries Compilation Tcl Command Example**

This section illustrates and describes a few examples of Simulation Libraries Compilation Tcl command.

**Example 1**

The following command will compile all the Lattice FPGA libraries for both Verilog and VHDL simulation, and place them under the folder specified by -target\_path. The path to QuestaSim is specified by -sim\_path.

```
cmpl_libs -sim_path C:/questasim64_10.4e/win64 -target_path c:/
mti_libs
```

# Timing and Physical Constraints Commands

## Radiant Software Timing Constraints Tcl Commands

The section describes the commands are used to set timing constraints.

### Radiant Software Timing Constraints Tcl Command Descriptions

The following table provides a listing of all valid Radiant software timing constraints-related Tcl command options and describes option functionality.

**Table 36: Radiant Software Timing Constraints Tcl Commands**

| Command                                 | Description                                 |
|-----------------------------------------|---------------------------------------------|
| <a href="#">create_clock</a>            | Create a named or virtual clock.            |
| <a href="#">create_generated_clock</a>  | Create a generated clock object.            |
| <a href="#">set_clock_groups</a>        | Set clock groups.                           |
| <a href="#">set_clock_latency</a>       | Define a clock's source or network latency. |
| <a href="#">set_clock_uncertainty</a>   | Set clock uncertainty.                      |
| <a href="#">set_false_path</a>          | Define false path.                          |
| <a href="#">set_input_delay</a>         | Set input delay on ports.                   |
| <a href="#">set_load</a>                | Set capacitance on ports.                   |
| <a href="#">set_max_delay</a>           | Specify maximum delay for timing paths.     |
| <a href="#">set_max_skew</a>            | Define maximum skew of path.                |
| <a href="#">set_min_delay</a>           | Specify minimum delay for timing paths.     |
| <a href="#">set_multicycle_path</a>     | Define multicycle path.                     |
| <a href="#">set_output_delay</a>        | Set output delay on ports.                  |
| <a href="#">set_hierarchy_separator</a> | Set or get hierarchy separator.             |

### create\_clock

Commands to create a new clock object and define its characteristics.

#### Syntax

```
create_clock -period <period_value> [-name <clock_name>]
           [-waveform {<value1 value2>}] [<source_object>] [-add]
```

## Arguments

- ▶ **-period period\_value**: This value specifies the clock period in nanoseconds. The value you specify is the minimum time over which the clock waveform repeats. The value specified for the period must be positive as the period of a clock must be greater than zero. The duty cycle of the clock is 50 percent.
- ▶ **-name clock\_name**: This name string specifies the name of the clock. If this parameter is not given, the name of the source object is used as the name of the clock (optional).
- ▶ **-waveform {value1 value2}**: These values are a list of edge values. Only two edges are supported. Floating values are accepted. Value1 must be less than value2, and the difference must be less than the clock period. Note that value1 must also be less than the clock period (optional).
- ▶ **-source\_object**: This value is the object on which the clock constraint is defined. The source object can be a port, pin or a net object in the design. If you specify a clock constraint on a source object that already has a clock, the new clock replaces the existing one (optional).
- ▶ **-add**: This option allows defining another clock on an object that already has a clock (optional).

## Example 1

The following example creates two clocks on ports CK1 and CK2 with a period of 6:

```
create_clock -name my_user_clock -period 6 [get_ports CK1]
create_clock -name my_other_user_clock -period 6
[get_ports CK2]
```

## Example 2

The following example creates a clock on port CK3 with a period of 7.1, and has two edges at 0 and 4.1:

```
create_clock -period 7.1 -waveform {0 4.1} [get_ports CK3]
```

## See Also

- ▶ [“Radiant Software Timing Constraints Tcl Commands” on page 1879](#)

## create\_generated\_clock

Commands to create an internally generated clock object and define its characteristics.

### Syntax

```
create_generated_clock
```

```

[-name <clock_name>] -source <source_object>
[-edges {<value1 value2 value3>}]
[-edge_shift {<value1 value2 value3>}]
[-divide_by <factor>]
[-multiply_by <factor>]
[-duty_cycle <percent>]
[-invert]
[-add]
[-master_clock <clock>] <object_list>

```

## Arguments

- ▶ **-name clock\_name:** This name string specifies the name of the generated clock (optional).
- ▶ **-source source\_object:** This value is an object on which the source clock of the generated clock is defined. The source object can be a port, pin or a net object. The period of the generated clock is derived from the clock on the source object using the multiply and divide factors.
- ▶ **-edges {value1 value2 value3}:** These values are a list of three numbers which correspond to the edge of the source clock from which the generated clock has been obtained. This option cannot be used with '-divide\_by', '-multiply\_by' and '-duty\_cycle' (optional).
- ▶ **-edge\_shift {value1 value2 value3}:** These values are a list of three numbers that represents the amount of shift (optional).
- ▶ **-divide\_by factor:** This value specifies the frequency division factor. Default value is 1. The frequency of the generated clock is equal to the frequency of the source clock divided by this factor, if the multiply by factor is not specified (optional).
- ▶ **-multiply\_by factor:** This value specifies the frequency multiplication number to be used when finding the generated clock frequency. Default value is 1 (optional).
- ▶ **-duty\_cycle factor:** This value specifies the duty cycle in percentage of the clock period. The value can be floating point and ranges from 0 to 100. The default value is 50. This option cannot be used with '-divide\_by' (optional).
- ▶ **-invert:** This option inverts the clock edge (optional).
- ▶ **-add:** This option allows defining another clock on an object that already has a generated clock.
- ▶ **-master\_clock clock:** This value specifies the master clock for the generated clock object if there are multiple clocks found on the source object (optional).
- ▶ **-object\_list:** This value is a list of clock source pins, ports, or nets.

## Example 1

The following example creates a generated clock on pin pll1/CLKOP with a period twice as long as the period at the reference port CLK:

```
create_generated_clock -divide_by 2 -source
```

```
[get_ports CLK]
[get_pins pll1/CLKOP]
```

### Example 2

The following example creates a generated clock at the primary output of myPLL with a period three quarters of the period at the reference pin clk:

```
create_generated_clock -divide_by 3 -multiply_by 4 -source
[get_ports clk] [get_pins myPLL/CLK1]
```

### Example 3

The following example shows a clock with a duty cycle of 60 percent:

```
create_generated_clock -duty_cycle 60 -source
[get_ports clk] [get_pins myPLL/CLK1]
```

### See Also

- ▶ [“Radiant Software Timing Constraints Tcl Commands” on page 1879](#)

## set\_clock\_groups

Commands to specify clock groups that are mutually exclusive or asynchronous with each other in a design so that the paths between these clocks are not considered during timing analysis.

### Syntax

```
set_clock_groups (-logically_exclusive | -physically_exclusive
| -asynchronous) [-group <clock_objects>] [-group
<clock_objects>]
```

### Arguments

- ▶ **-logically\_exclusive:** This option specifies that clocks are mutually exclusive and will not reach the flip flops at the same time due to logic implementation (optional).
- ▶ **-physically\_exclusive:** This option specifies that clocks are mutually exclusive. Only one clock group is active at any given time (optional).
- ▶ **-asynchronous:** This option specifies that the clock groups are asynchronous to each other. Two clocks are asynchronous with respect to each other if they have no phase relationship at all. One option among '-logically\_exclusive', '-physically\_exclusive' and '-physically\_exclusive' is needed and they are mutually exclusive (optional).
- ▶ **-group clock\_objects:** This value specifies the clock objects in a group. At least one '-group' is needed. Each group of clocks is exclusive or asynchronous with the clocks which are specified in the other group. Specifying one group indicates that the clocks in this group are exclusive or asynchronous with all other clocks in the design including one clock which is created in the future (optional).

### Example 1

The following example specifies two clock ports (clka and clkb) are asynchronous to each other:

```

create_clock -period 10.000 -name clka_port [get_ports clka]
create_clock -period 10.000 -name clkb_port [get_ports clkb]
# Set clka_port and clkb_port to be mutually exclusive clocks.
set_clock_groups -asynchronous -group [get_clocks clka_port] -
group [get_clocks clkb_port]
# The previous line is equivalent to the following two
commands.
set_false_path -from [get_clocks clka_port] -to [get_clocks
clkb_port]
set_false_path -from [get_clocks clkb_port] -to [get_clocks
clka_port]

```

### Example 2

The following example specifies four clock constraints that won't be active at the same time:

```

create_clock -period 10.000 -name clka_port [get_ports clka]
create_clock -period 10.000 -name clkb_port [get_ports clkb]
create_clock -period 10.000 -name clkc_port [get_ports clkc]
set_clock_groups -logically_exclusive -group [get_clocks
{clka_port clkb_port}] -group [get_clocks clkc_port]

```

### See Also

- ▶ [“Radiant Software Timing Constraints Tcl Commands” on page 1879](#)

## set\_clock\_latency

Commands to define a clock's source or network latency.

### Syntax

```

set_clock_latency [-rise] [-fall] [-early | -late] -source
<latency> <object_list>

```

### Arguments

- ▶ **-rise:** This option specifies the latency for the rising clock edge (optional).
- ▶ **-fall:** This option specifies the latency for the falling clock edge (optional).
- ▶ **-early|-late:** This option specifies how early|late the clock edge arrives. Option '-early' and '-late' are mutually exclusive (optional).
- ▶ **-source:** This option indicates the specified latency as a source latency.
- ▶ **<latency>:** This value specifies the value of latency.
- ▶ **object\_list>:** This value is a list of clocks. You can also use the keyword '[all\_clocks]' to include all clocks.

**Example**

In the following example, 3ns is in the destination clock of setup and source clock of hold; while 4ns is in source clock of setup and destination clock of hold.

```
set_clock_latency 3 -source -early [get_clocks clk1]
set_clock_latency 4 -source -late [all_clocks]
```

**See Also**

- ▶ [“Radiant Software Timing Constraints Tcl Commands” on page 1879](#)

**set\_clock\_uncertainty**

Commands to indicate that the clock of interest has uncertainties in its period.

**Syntax**

```
set_clock_uncertainty [-setup] [-hold] [-from <clock>] [-to
<clock>] <uncertainty> [<clock_list>]
```

**Arguments**

- ▶ **-setup:** This option indicates the constraint for setup analysis (optional).
- ▶ **-hold:** This option indicates the constraint for hold analysis (optional).
- ▶ **-from clock:** This value specifies uncertainty source clock and the timer requires the 'from' option to be accompanied by a 'to' option (optional).
- ▶ **-to clock:** This value specifies uncertainty destination clock (optional).
- ▶ **<uncertainty>:** This value specifies the amount by which the clock period in uncertain.
- ▶ **<clock\_list>:** This value is a list of clocks. You can also use the keyword '[all\_clocks]' to include all clocks. One option between '-from' and 'clock\_list' is needed and they are mutually exclusive (optional).

**Examples**

The following two examples specify clock uncertainty, one with a from/to. The first constraint sets the uncertainty of clk1 to half a nanosecond and the second constraint sets the uncertainty to 400 picoseconds when a path is launched by clk2 and captured by clk3.

```
set_clock_uncertainty 0.5 [get_clocks clk1]
set_clock_uncertainty 0.4 -from [get_clocks clk2] -to
[get_clocks clk3]
```

**See Also**

- ▶ [“Radiant Software Timing Constraints Tcl Commands” on page 1879](#)

## set\_false\_path

Commands to identify paths that are considered false and excluded from timing analysis.

### Syntax

```
set_false_path
[-from <port_list|pin_list|instance_list|clock_list>]
[-to <port_list|pin_list|instance_list|clock_list>]
[-through <port_list|pin_list|instance_list|net_list>]
[-rise_from <clock_list>] [-rise_to <clock_list>]
[-fall_from <clock_list>] [-fall_to <clock_list>]
[-setup] [-hold]
```

### Arguments

- ▶ **-from port\_list|pin\_list|instance\_list|clock\_list:** This value specifies the timing path start points (optional).
- ▶ **-to port\_list|pin\_list|instance\_list|clock\_list:** This value specifies the timing path end points (optional).
- ▶ **-through object\_list:** This value is a list of through points which the paths should be blocked (optional).
- ▶ **-rise\_from|fall\_from clock\_list:** Same as '-from' but only applies to clock objects. Option '-from', 'rise\_from' and '-fall\_from' are mutually exclusive.
- ▶ **-rise\_to|fall\_to object\_list clock\_list:** Same as '-to' but only applies to clock objects. Option '-to', 'rise\_to' and '-fall\_to' are mutually exclusive. At least one option among '-from|-rise\_from|-fall\_from|-to|-rise\_to|-fall\_to|-through' is needed.
- ▶ **-setup:** This option indicates to eliminate setup timing analysis for specified timing paths (optional).
- ▶ **-hold:** This option indicates to eliminate hold timing analysis for specified timing paths (optional).

### Example 1

The following example specifies all paths from clock pins of the registers in clock domain clk1 to data pins of a specific register in clock domain clk2 as false paths:

```
set_false_path -from [get_ports clk1] -to [get_cells reg_2]
```

### Example 2

The following example specifies all paths through the net UO/sigA as false:

```
set_false_path -through [get_nets UO/sigA]
```

### See Also

- ▶ [“Radiant Software Timing Constraints Tcl Commands” on page 1879](#)

## set\_input\_delay

Commands to define the arrival time of an input relative to a clock.

### Syntax

```
set_input_delay -clock <clock_object> [-clock_fall] [-max | -min] [-add_delay] <delay_value> <port_list>
```

### Arguments

- ▶ **-clock clock\_object:** This value specifies the clock reference to which the specified input delay is related.
- ▶ **-clock\_fall:** This option is a switch to specify the falling edge of clock to trigger (optional).
- ▶ **-max:** This option specifies that the delay value is the maximum delay (optional).
- ▶ **-min:** This option specifies that the delay value is the minimum delay. Option '-max' and '-min' are mutually exclusive (optional).
- ▶ **add\_delay:** This option is used to define more than one input delay on a given port (optional).
- ▶ **<delay\_value>:** This value specifies the arrival time in nanoseconds that represents the amount of time for which the signal is available at the specified input after a clock edge.
- ▶ **<port\_list>:** This value provides one or more input ports in the current design to which delay\_value is assigned. You can also use the keyword '[all\_inputs]' to include all input ports.

### Example 1

The following example sets an input delay of 1.2 ns for port data1 relative to the rising edge of CLK1:

```
set_input_delay 1.2 -clock [get_clocks CLK1] [get_ports data1]
set_input_delay 4.0 -clock [get_clocks vclk] -add_delay
[get_ports out2]
```

## Example 2

The following example sets an input delay of 1.2 ns minimum and 1.5 ns maximum for port data1 relative to the rising edge of CLK1:

```
set_input_delay 1.2 -min -clock [get_clocks CLK1]
[get_ports data1]
set_input_delay 1.5 -max -clock [get_clocks CLK1]
[get_ports data1]
```

## See Also

- ▶ [“Radiant Software Timing Constraints Tcl Commands” on page 1879](#)

## set\_load

Commands to set capacitance on ports.

### Syntax

```
set_load <capacitance> <objects>
```

### Arguments

- ▶ **<capacitance>**: This value specifies the load in capacitance in pF.
- ▶ **<objects>**: This value provides one or more output ports in the current design to which capacitance is assigned. You can also use the keyword '[all\_outputs]' to include all output ports.

## Example

The following example sets a capacitive load of 25 pF for output port OUT:

```
set_load 25 [get_ports {out}]
```

## See Also

- ▶ [“Radiant Software Timing Constraints Tcl Commands” on page 1879](#)

## set\_max\_delay

Commands to specifies the maximum delay for the timing paths.

### Syntax

```
set_max_delay
[-from <port_list|pin_list|instance_list|clock_list>]
[-to <port_list|pin_list|instance_list|clock_list>]
[-through <port_list|pin_list|instance_list|net_list>]
[-datapath_only]
[-rise_from <clock_list>]
[-rise_to <clock_list>]
[-fall_from <clock_list>]
[-fall_to <clock_list>] <delay_value>
```

### Arguments

- ▶ **-from port\_list|pin\_list|instance\_list|clock\_list:** This value specifies the timing path start points (optional).
- ▶ **-to port\_list|pin\_list|instance\_list|clock\_list:** This value specifies the timing path end points (optional).
- ▶ **-through object\_list:** This value specifies the timing path pass through points. The timing paths must go through these points (optional).
- ▶ **-rise\_from|fall\_from clock\_list:** Same as '-from' but only applies to clock objects. Option '-from', 'rise\_from' and 'fall\_from' are mutually exclusive.
- ▶ **-rise\_to|fall\_to clock\_list:** Same as '-to' but only applies to clock objects. Option '-to', 'rise\_to' and 'fall\_to' are mutually exclusive. At least one option among '-from|-rise\_from|-fall\_from|-to|-rise\_to|-fall\_to|-through' is needed.
- ▶ **-datapath\_only:** This option calculates the Clock-to-Q delay of the first flop, the total delay between the flops, and the setup time of the second flop (optional).
- ▶ **<delay\_value>:** This value specifies a floating point number in nanoseconds that represents the required maximum delay value for specified paths.

### Example

The following example sets a maximum delay by constraining all paths from ff1a:CLK to ff2e:D with a delay less than or equal to 5 ns:

```
set_max_delay
[-from <port_list|pin_list|instance_list|clock_list>]
[-to <port_list|pin_list|instance_list|clock_list>]
[-through <port_list|pin_list|instance_list|net_list>]
[-datapath_only]
[-rise_from <clock_list>]
[-rise_to <clock_list>]
[-fall_from <clock_list>]
[-fall_to <clock_list>] <delay_value>
```

### See Also

- ▶ [“Radiant Software Timing Constraints Tcl Commands” on page 1879](#)

## set\_max\_skew

Commands to define the max skew of a path.

### Syntax

```
set_max_skew <net_list|pin_list> <skew_value>
```

### Arguments

- ▶ **<net\_list|pin\_list>**: This value is a list of pins or nets.
- ▶ **<skew\_value>**: This value controls the delay to the various loads of the nket relative to each other.

### Example

The following example shows that the first constraint requires the maximum difference between the net delays of the loads on the net connected to pin “A” to be less than or equal to 250 picoseconds. The second constraint requires the difference between the net delays to the various loads of the net “ff1/Q\_c” to be less than or equal to 370 picoseconds:

```
set_max_skew [get_pins A] 0.25
set_max_skew [get_nets ff1/Q_c] 0.37
```

### See Also

- ▶ [“Radiant Software Timing Constraints Tcl Commands” on page 1879](#)

## set\_min\_delay

Commands to specify the minimum delay for the timing paths.

### Syntax

```
set_min_delay
[-from <port_list|pin_list|instance_list|clock_list>]
[-to <port_list|pin_list|instance_list|clock_list>]
[-through <port_list|pin_list|instance_list|net_list>]
[-rise_from <clock_list>]
[-rise_to <clock_list>]
[-fall_from <clock_list>]
[-fall_to <clock_list>]
<delay_value>
```

### Arguments

- ▶ **-from port\_list|pin\_list|instance\_list|clock\_list**: This value specifies the timing path start points (optional).

- ▶ **-to port\_list|pin\_list|instance\_list|clock\_list:** This value specifies the timing path end points (optional).
- ▶ **-through object\_list:** This value specifies the timing path pass through points. The timing paths must go through these points (optional).
- ▶ **-rise\_from|fall\_from clock\_list:** Same as '-from' but only applies to clock objects. Option '-from', 'rise\_from' and '-fall\_from' are mutually exclusive.
- ▶ **-rise\_to|fall\_to object\_list:** Same as '-to' but only applies to clock objects. Option '-to', 'rise\_to' and '-fall\_to' are mutually exclusive. At least one option among '-from|-rise\_from|-fall\_from|-to|-rise\_to|-fall\_to|-through' is needed.
- ▶ **<delay\_value>:** This value specifies a floating point number in nanoseconds that represents the required minimum delay value for specified paths.

### Example

The following example sets a minimum delay by constraining all paths from ff1a:CLK to ff2e:D with a delay greater than or equal to 5 ns:

```
set_min_delay
-from [get_cells ff1a]
-to [get_cells ff2e] 5.0 set_min_delay
-from [get_pins ff1/Q]
-through [get_pins and1/B]
-to [get_pins ff2/D] 7.0
```

### See Also

- ▶ [“Radiant Software Timing Constraints Tcl Commands” on page 1879](#)

## set\_multicycle\_path

Commands to define a path that takes multiple clock cycles.

### Syntax

```
set_multicycle_path
[-from <port_list|pin_list|instance_list|clock_list>]
[-to <port_list|pin_list|instance_list|clock_list>]
[-through <port_list|pin_list|instance_list|net_list>]
[-rise_from <clock_list>] [-rise_to <clock_list>]
[-fall_from <clock_list>] [-fall_to <clock_list>]
[-setup | -hold] [-start | -end] <path_multiplier>
```

### Arguments

- ▶ **-from port\_list|pin\_list|instance\_list|clock\_list:** This value specifies the timing path start point (optional).
- ▶ **-to port\_list|pin\_list|instance\_list|clock\_list:** This value specifies the timing path end point (optional).

- ▶ **-through port\_list|pin\_list|instance\_list|net\_list:** This value specifies the timing path pass through point. The timing path must go through this object (optional).
- ▶ **-rise\_from|fall\_from clock\_list:** Same as '-from' but only applies to clock objects. Option '-from', 'rise\_from' and '-fall\_from' are mutually exclusive.
- ▶ **-rise\_to|fall\_to clock\_list:** Same as '-to' but only applies to clock objects. Option '-to', 'rise\_to' and '-fall\_to' are mutually exclusive. At least one option among '-from|-rise\_from|-fall\_from|-to|-rise\_to|-fall\_to|-through' is needed.
- ▶ **-setup:** This option set Setup multiplier (optional).
- ▶ **-hold:** This option set Hold multiplier. Option '-setup' and '-hold' are mutually exclusive (optional).
- ▶ **-start:** This option indicates that Multiplier measured against startpoint (optional).
- ▶ **-end:** This option indicates that Multiplier measured against endpoint. Option '-start' and '-end' are mutually exclusive (optional).
- ▶ **<path\_multiplier>:** This value specifies a value that represents the number of cycles.

### Example

The following example sets all paths between reg1 and reg2 to 3 cycles for setup check. Hold check is measured at the previous edge of the clock at reg2:

```
set_multicycle_path 3 -from [get_cells reg1] -to [get_cells reg2]
set_multicycle_path 3 -from [get_pins ff1/Q] -through [get_pins and1/B] -to [get_pins ff2/D]
```

### See Also

- ▶ [“Radiant Software Timing Constraints Tcl Commands” on page 1879](#)

## set\_output\_delay

Commands to define the output delay of an output relative to a clock.

### Syntax

```
set_output_delay -clock <clock_object> [-clock_fall]
[-max | -min] [-add_delay] <delay_value> <port_list>
```

### Arguments

- ▶ **-clock clock\_object:** This value specifies the clock reference to which the specified output delay is related.
- ▶ **-clock\_fall:** This option is a switch to specify the falling edge of clock to trigger (optional).

- ▶ **-max:** This option specifies that the delay value is the maximum delay (optional).
- ▶ **-min:** This option specifies that the delay value is the minimum delay. Option '-max' and '-min' are mutually exclusive (optional).
- ▶ **-add\_delay:** This option is used to define more than one output delay on a given port (optional).
- ▶ **<delay\_value>:** This value specifies the amount of time from a reference clock to a primary output port.
- ▶ **<port\_list>:** This value provides one or more output ports in the current design to which delay\_value is assigned. You can also use the keyword '[all\_outputs]' to include all output ports.

### Example 1

The following example sets an output delay of 1.2 ns for all outputs relative to CLK1

```
set_output_delay 1.2 -clock [get_clocks CLK1]
[get_ports OUT1]
set_output_delay 1.2 -clock [get_clocks CLK1]
[all_outputs]
```

### Example 2

The following example sets an output delay of 1.2 ns minimum and 1.5 ns maximum for port data1 relative to the rising edge of CLK1:

```
set_output_delay 1.2 -min -clock [get_clocks CLK1]
[get_ports data1]
set_output_delay 1.5 -max -clock [get_clocks CLK1]
[get_ports data1]
```

### See Also

- ▶ [“Radiant Software Timing Constraints Tcl Commands” on page 1879](#)

## set\_hierarchy\_separator

Commands to set or get hierarchy separator.

### Syntax

```
set_hierarchy_separator [<separator>]
```

### Arguments

- ▶ **separator:** This option specifies the separator which is going to be set as hierarchy separator (optional).

If no separator is specified, current separator is print out.

**Example 1**

The following example sets '/' (forward slash) as hierarchy separator:

```
set_hierarchy_separator /
```

**Example 2**

The following example gets the current hierarchy separator:

```
set_hierarchy_separator
```

## Radiant Software Physical Constraints Tcl Commands

The **ldc** commands are used to set physical constraints.

**Radiant Software Physical Constraints Tcl Command Descriptions**

The following table provides a listing of all valid Radiant software physical constraints-related Tcl command options and describes option functionality.

**Table 37: Radiant Software Physical Constraints Tcl Commands**

| Command                                     | Description                                                   |
|---------------------------------------------|---------------------------------------------------------------|
| <a href="#">ldc_create_constraint_set</a>   | Create a new constraint set.                                  |
| <a href="#">ldc_create_group</a>            | Define a single identifier that refers to a group of objects. |
| <a href="#">ldc_create_macro</a>            | Define a macro.                                               |
| <a href="#">ldc_create_region</a>           | Define a rectangular area.                                    |
| <a href="#">ldc_create_vref</a>             | Define a voltage reference.                                   |
| <a href="#">ldc_current_constraint_set</a>  | Switch the constraint set by the name.                        |
| <a href="#">ldc_define_attribute</a>        | Define LSE attributes.                                        |
| <a href="#">ldc_define_global_attribute</a> | Define LSE global attributes.                                 |
| <a href="#">ldc_delete_constraint</a>       | Clear constraints by given IDs.                               |
| <a href="#">ldc_delete_constraint_set</a>   | Delete the constraint set by the name.                        |
| <a href="#">ldc_get_groups</a>              | Return group objects.                                         |
| <a href="#">ldc_list_constraint</a>         | List constraints from database.                               |
| <a href="#">ldc_list_constraint_sets</a>    | List all existing constraint sets.                            |
| <a href="#">ldc_prohibit</a>                | Prohibit site or region.                                      |

**Table 37: Radiant Software Physical Constraints Tcl Commands**

| Command                           | Description                                               |
|-----------------------------------|-----------------------------------------------------------|
| <a href="#">ldc_read</a>          | Read constraint file.                                     |
| <a href="#">ldc_set_attribute</a> | Set object attributes.                                    |
| <a href="#">ldc_set_location</a>  | Set object location.                                      |
| <a href="#">ldc_set_port</a>      | Set port constraint attributes.                           |
| <a href="#">ldc_set_sysconfig</a> | Set sysconfig attributes.                                 |
| <a href="#">ldc_set_vcc</a>       | Set the voltage and/or derate for the bank, core or dphy. |
| <a href="#">ldc_write</a>         | Write constraint file.                                    |

## ldc\_create\_constraint\_set

Commands to create a new constraint set.

### Syntax

```
ldc_create_constraint_set [-name_style logic ]
[-copy_from <copy_from_name>] <name>
```

### Arguments

- ▶ **-name\_style logic:** This value indicates that name style of new constraint set is logic. When this option is set, only constraint file with logical names can be loaded in this constraint set (optional).
- ▶ **-copy\_from copy\_from\_name:** This value specifies an existing constraint set from which the new set will copy constraints (optional).
- ▶ **name:** This name string specifies the name of the new constraint set.

### Example

The following example creates a new constraint set 'test' with name style 'logic':

```
ldc_create_constraint_set -name_style logic test
```

### See Also

- ▶ [“Radiant Software Physical Constraints Tcl Commands” on page 1893](#)

## ldc\_create\_group

Commands to define a single identifier that refers to a group of objects.

### Syntax

```
ldc_create_group -name <group_name>
[-bbox {height width}] <objects>
```

### Arguments

- ▶ **-name group\_name:** This value specifies the group name.
- ▶ **-bbox {height width}:** This value specifies the maximum number of rows (R) and columns (C), of the group's bounding box. This option is not applicable to port (optional).
- ▶ **object:** Objects named in the group, either port, instance, pin or net.

### Example

```
ldc_create_group -name group1 [get_ports {a*}]
```

### See Also

- ▶ [“Radiant Software Physical Constraints Tcl Commands” on page 1893](#)

## ldc\_create\_macro

Commands to define an instance in a design as a macro.

### Syntax

```
ldc_create_macro [-name <macro_name>]  
[-use_pio <ports_list>] <instance>
```

### Arguments

- ▶ **-name macro\_name:** This value specifies the macro name (optional).
- ▶ **-use\_pio ports\_list:** This value specifies macro ports that are directly connected outside of the design (optional).
- ▶ **instance:** The instance which is defined as a macro.

### Example

```
ldc_create_macro -name macro_top -use_pio {din*}  
[get_cells u_top]
```

### See Also

- ▶ [“Radiant Software Physical Constraints Tcl Commands” on page 1893](#)

## ldc\_create\_region

Commands to define a rectangular area.

### Syntax

```
ldc_create_region -name <region_name> (-anchor <anchor>|
    -site <site>) -width <width> -height <height>
    [-buffer_left <left>] [-buffer_right <right>]
    [-buffer_top <top>] [-buffer_bottom <bottom>]
    [-exclusive] [-routing_exclusive]
```

### Arguments

- ▶ **-name region\_name:** This value specifies the region name.
- ▶ **-anchor anchor:** This value specifies anchor.
- ▶ **-site site:** This value specifies the site name. Option '-anchor' and '-site' are mutually exclusive.
- ▶ **-width width:** This value specifies the width of the placement region in columns.
- ▶ **-height height:** This value specifies the height of the placement region in rows.
- ▶ **-buffer\_left left:** This value specifies the left buffer zone of the routing region (optional).
- ▶ **-buffer\_right right:** This value specifies the right buffer zone of the routing region (optional).
- ▶ **-buffer\_top top:** This value specifies the top buffer zone of the routing region (optional).
- ▶ **-buffer\_bottom bottom:** This value specifies the bottom buffer zone of the routing region. Options '-buffer\_left', '-buffer\_right', '-buffer\_top' and '-buffer\_bottom' are only for creating macro region. Without these options routing region is identical to placement region (optional).
- ▶ **-exclusive:** This option indicates that the current buffer cannot be used to place and route other logic during the Reuse stage (optional).
- ▶ **-routing\_exclusive:** This option indicates that the current buffer cannot be used to route other logic during the Reuse stage. Options '-exclusive' and '-routing\_exclusive' are only for creating macro region (optional).

### Example

```
ldc_create_region -name top_region -site R17C2D
-width 23 -height 39
```

### See Also

- ▶ [“Radiant Software Physical Constraints Tcl Commands” on page 1893](#)

## ldc\_create\_vref

Commands to define a voltage reference.

### Syntax

```
ldc_create_vref -name <vref_name> -site <site_name>
```

### Arguments

- ▶ **-name vref\_name:** This value specifies voltage reference name.
- ▶ **-site site\_name:** This value specifies PIO site of the target device.

### Example

```
ldc_create_vref -name VREF1_BANK_3 -site N21
```

### See Also

- ▶ [“Radiant Software Physical Constraints Tcl Commands” on page 1893](#)

## ldc\_current\_constraint\_set

Commands to switch the constraint set by the name.

### Syntax

```
ldc_current_constraint_set [<name>]
```

### Arguments

- ▶ **name:** This option specifies the constraint set which is going to be active. If no constraint set is specified, current active constraint set is print out (optional).

### Example 1

The following example switches the constraint set 'test' to be active:

```
ldc_current_constraint_set test
```

### Example 2

The following example gets the active constraint set:

```
ldc_current_constraint_set
```

### See Also

- ▶ [“Radiant Software Physical Constraints Tcl Commands” on page 1893](#)

## ldc\_define\_attribute

Commands to define LSE attribute.

### Syntax

```
ldc_define_attribute -attr <attr_name> -value  
<attr_value> -object_type <type> -object <objects>  
[-disable] [-comment <comment>]
```

### Arguments

- ▶ **-attr attr\_name:** This value indicates LSE attributes name, such as 'loc'.
- ▶ **-value attr\_value:** This value indicates LSE attribute value such as '2'.
- ▶ **-object\_type type:** This value indicates the type of object to which the attribute belongs, such as 'port'.
- ▶ **-object objects:** This value indicates the specific object to which the attribute applies, such as 'clk'.
- ▶ **-disable:** This option indicates that the command is disabled (optional).
- ▶ **-comment:** This option specifies comment of the command (optional).

### Example

```
ldc_define_attribute -attr loc -value 2 -object_type  
port -object {clk}
```

### See Also

- ▶ [“Radiant Software Physical Constraints Tcl Commands” on page 1893](#)

## ldc\_define\_global\_attribute

Commands to define global LSE attribute

### Syntax

```
ldc_define_global_attribute -attr <attr_name> -value  
    <attr_value> [-disable] [-comment <comment>]
```

### Arguments

- ▶ **-attr attr\_name:** This value indicates LSE attributes name, such as syn\_ramstyle'.
- ▶ **-value attr\_value:** This value indicates LSE attribute value such as 'registers'.
- ▶ **-disable:** This option indicates that the command is disabled (optional).
- ▶ **-comment:** This option specifies comment of the command (optional).

**Example**

```
ldc_define_global_attribute -attr syn_ramstyle  
-value registers
```

**See Also**

- ▶ [“Radiant Software Physical Constraints Tcl Commands” on page 1893](#)

**ldc\_delete\_constraint**

Commands to clear constraints by given IDs.

**Syntax**

```
ldc_delete_constraint [-all] [<id>] [<id>...]
```

**Arguments**

- ▶ **-all**: This option indicates that the command will delete all constraints (optional).
- ▶ **-id**: This value specifies the id of constraint which is going to be deleted (optional).

**Example**

The following example deletes constraint with index 3:

```
ldc_delete_constraint 3
```

**See Also**

- ▶ [“Radiant Software Physical Constraints Tcl Commands” on page 1893](#)

**ldc\_delete\_constraint\_set**

Commands to delete the constraint set by the name.

**Syntax**

```
ldc_delete_constraint_set <name>
```

**Arguments**

- ▶ **name**: This value specifies the name of the constraint set which is going to be deleted. Active constraint set can't be deleted.

### Example

The following example deletes constraint set 'test':  
`ldc_delete_constraint_set test`

### See Also

- ▶ [“Radiant Software Physical Constraints Tcl Commands” on page 1893](#)

## ldc\_get\_groups

Commands to return group objects.

### Syntax

```
ldc_get_groups [-regexp] [-nocase] [<patterns>]
```

### Arguments

- ▶ **-regexp:** This option indicates that patterns are full regular expressions (optional).
- ▶ **-nocase:** This option indicates that matching is case-insensitive (optional).
- ▶ **patterns:** This value specifies the patterns against which group names are matched. If no pattern is specified, set '\*' as default (optional).

### Example

```
ldc_get_groups -nocase -regexp group\[0-9]+\
```

### See Also

- ▶ [“Radiant Software Physical Constraints Tcl Commands” on page 1893](#)

## ldc\_list\_constraint

Commands to list constraints from database.

### Syntax

```
ldc_list_constraint [-all|-a]
```

### Arguments

- ▶ **-all|-a**: This option indicates that the command will get all the constraints including disabled or incorrect constraints (optional).

### Example

The following example lists enabled and correct constraints from database:

```
ldc_list_constraint
```

### See Also

- ▶ [“Radiant Software Physical Constraints Tcl Commands” on page 1893](#)

## ldc\_list\_constraint\_sets

Commands to list all existing constraint sets.

### Syntax

```
ldc_list_constraint_sets
```

### Example

The following example lists all existing constraint sets in the current view:

```
ldc_list_constraint_sets
```

### See Also

- ▶ [“Radiant Software Physical Constraints Tcl Commands” on page 1893](#)

## ldc\_prohibit

Commands to prohibit the use of a site or all sites in a region.

### Syntax

```
ldc_prohibit (-site <site> | -region <region>)
```

### Arguments

- ▶ **-site site:** This value specifies site name.
- ▶ **-region region:** This value specifies region name. Option '-site' and '-region' are mutually exclusive.

### Example

```
ldc_prohibit -site AB  
ldc_prohibit -region regionA
```

### See Also

- ▶ [“Radiant Software Physical Constraints Tcl Commands” on page 1893](#)

## ldc\_read

Commands to read constraint file.

### Syntax

```
ldc_read <file>
```

### Arguments

- ▶ **file:** This value specifies the constraint file which is going to be read.

### Example

The following example reads constraint file test.sdc:

```
ldc_read test.sdc
```

### See Also

- ▶ [“Radiant Software Physical Constraints Tcl Commands” on page 1893](#)

## ldc\_set\_attribute

Commands to set constraint attributes to the objects.

### Syntax

```
ldc_set_attribute <key-value list> [objects]
```

### Arguments

- ▶ **key-value list:** This value is a list of constraint attributes.
- ▶ **objects:** This value specifies object(s), to which constraint attributes are set. If no object is specified, attributes are set to design (optional).

### Example

```
ldc_set_attribute GSR_NET=TRUE [get_nets {my_gsr}]
```

### See Also

- ▶ [“Radiant Software Physical Constraints Tcl Commands” on page 1893](#)

## ldc\_set\_location

Commands to set object location.

### Syntax

```
ldc_set_location [-site <site_name>] [-bank <bank_num>]  
                 [-region <region_name>] <object>
```

### Arguments

- ▶ **-site site\_name:** This value specifies name of the site to place object (optional).
- ▶ **-bank bank\_num:** This value specifies number of the bank to place object (optional).
- ▶ **-region region\_name:** This value specifies name of the user defined region to place object. One option among '-site', '-bank' and '-region' is needed and they are mutually exclusive (optional).
- ▶ **object:** Object to be located.

### Example

```
ldc_set_location -site U6 [get_ports clk]  
ldc_set_location -region region0 [ldc_get_groups {group1}]
```

### See Also

- ▶ [“Radiant Software Physical Constraints Tcl Commands” on page 1893](#)

## ldc\_set\_port

Commands to set port constraint attributes.

### Syntax

```
ldc_set_port (-iobuf [-vref <vref_name>]| -sso)
<key-value list> [ports]
```

### Arguments

- ▶ **-iobuf:** This option indicates that IOBUF attributes are set.
- ▶ **-vref vref\_name:** This value specifies voltage reference name. It must be bound to -iobuf (optional).
- ▶ **-sso:** This option indicates that SSO attributes are set. Option '-iobuf' and '-sso' are mutually exclusive.
- ▶ **key-value list:** This value is a list of attributes. Attributes must be enclosed with curly braces.
- ▶ **ports:** This value specifies ports to be set. If no port is specified, set constraint to all ports (optional).

### Example

```
ldc_create_vref -name VERF2 -site R11
ldc_set_port -iobuf -vref VERF2 {IO_TYPE=HSTL15_I
VREF=VREF2_LOAD} [get_ports clk_third]
```

### See Also

- ▶ [“Radiant Software Physical Constraints Tcl Commands” on page 1893](#)

## ldc\_set\_sysconfig

Commands to set sysconfig attributes.

### Syntax

```
ldc_set_sysconfig <key-value list>
```

### Arguments

- ▶ **key-value list:** This value is a list of SYSCONFIG attributes. Attributes must be enclosed with curly braces.

### Example

```
ldc_set_sysconfig {JTAG_PORT=ENABLE PROGRAMN_PORT=ENABLE
MCCLK_FREQ=56.2 DONE_OD=ON}
```

### See Also

- ▶ [“Radiant Software Physical Constraints Tcl Commands” on page 1893](#)

## ldc\_set\_vcc

Commands to set the voltage and/or derate for the bank, core or dphy.

### Syntax

```
ldc_set_vcc (-bank <bank_number>|-core|-dphy DPHY0/DPHY1)
            [-derate <derate>] [<voltage>]
```

### Arguments

- ▶ **-bank bank\_number:** This value specifies the bank to be set with voltage or voltage derating percent.
- ▶ **-core:** This option indicates that voltage or voltage derating percent is set to core.
- ▶ **-dphy DPHY0/DPHY1:** This option indicates that voltage or voltage derating percent is set to dphy. Value of option '-dphy' can only be 'DPHY0' or 'DPHY1'. Option '-bank', '-core' and '-dphy' are mutually exclusive.
- ▶ **-derate:** This value specifies voltage derating percent (optional).
- ▶ **voltage:** This value can be any compatible voltage supply to that bank or the core or dphy; for example, 2.5, 3.3. At least one option between '-derate' and 'voltage' is needed (optional).

### Example

```
ldc_set_vcc -bank 1 3.3
ldc_set_vcc -dphy DPHY0 -derate -3
```

### See Also

- ▶ [“Radiant Software Physical Constraints Tcl Commands” on page 1893](#)

## ldc\_write

Commands to write constraint file.

### Syntax

```
ldc_write [-overwrite|w] [-sdc] [-exclude_sdc]
[-include_error] <file>
```

### Arguments

- ▶ **-overwrite|w:** This option indicates that the command will overwrite file of the same name (optional).
- ▶ **-sdc:** This option indicates that only SDC timing constraints and Synthesis attributes will be written to file (optional).
- ▶ **-exclude\_sdc:** This option indicates that SDC timing constraints and Synthesis attributes won't be written to file. Option '-sdc' and '-exclude\_sdc' are mutually exclusive (optional).
- ▶ **-include\_error:** This option indicates that incorrect constraints will also be written to file (optional).
- ▶ **file:** This value specifies the constraint file which is going to be written.

### Example

```
ldc_write -sdc -include_error test.sdc
```

## Radiantc TCL Commands

Radiant has two design flow modes: GUI and pure TCL mode. In pure TCL mode, you can use all TCL commands. However, in GUI mode (including the TCL section within it), Radiant oversees the project process and status without retaining the design in memory. Consequently, any TCL commands that require access to design data are unavailable. The list of these commands is provided below.

- ▶ [Bitstream Generation Tcl Commands](#)
- ▶ [Design Tcl Commands](#)
- ▶ [Device Tcl Commands](#)
- ▶ [Technology Mapping Tcl Commands](#)
- ▶ [Placement Tcl Commands](#)
- ▶ [Routing Tcl Commands](#)

# Bitstream Generation Tcl Commands

The **bit** command is used for bitstream generation.

## Bitstream Generation Tcl Command Descriptions

The following table provides a listing of all valid Radiant software bitstream generation-related Tcl command options and describes option functionality.

**Table 38: Bitstream Generation Tcl Commands**

| Command                         | Description                  |
|---------------------------------|------------------------------|
| <a href="#">bit_generate</a>    | Generate a bitstream file.   |
| <a href="#">bit_list_option</a> | List bit generation options. |
| <a href="#">bit_set_option</a>  | Set bit generation options.  |

## bit\_generate

Generate bitstream file.

### Syntax

```
bit_generate [-w] <filename>
```

### Arguments

- ▶ **-w**: Overwrite existing bitstream file if <filename> exists.
- ▶ **<filename>**: Specify output bitstream file. Do not include '.bit' as it is appended (required).

### Example

```
bit_generate -w mydesign
```

### See Also

- ▶ [“Bitstream Generation Tcl Commands” on page 1907](#)

## bit\_list\_option

List bitgen options.

### Syntax

```
bit_list_option
```

### Example

```
bit_list_option
```

**See Also**

► [“Bitstream Generation Tcl Commands” on page 1907](#)

**bit\_set\_option**

Set bitgen options.

**Syntax**

```
bit_set_option {<key> <value> ...}
```

**Example**

```
bit_list_option
bit_set_option {enable_early_io_wakeup true ip_evaluation
false}
```

**See Also**

► [“Bitstream Generation Tcl Commands” on page 1907](#)

**Design Tcl Commands**

The **des** commands are used to read or write the Radiant unified design database (.udb) file and list and report netlist objects such as instance, net, or port. You can get these commands by using **help {des\_\*}**.

The following table provides a listing of all valid Radiant software design-related Tcl command options and describes option functionality.

**Table 39: Design Tcl Commands**

| Command                            | Description                                                                                                      |
|------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <a href="#">des_get_ram_cells</a>  | Retrieves memory cells in the design that are implemented as either distributed RAM (LUTRAM) or block RAM (EBR). |
| <a href="#">des_get_ram_style</a>  | Returns the memory style (LUTRAM or EBR) of a specified RAM cell in the design.                                  |
| <a href="#">des_get_util_data</a>  | Return the required data provided/used in device/design.                                                         |
| <a href="#">des_list_attribute</a> | List design attributes.                                                                                          |
| <a href="#">des_list_instance</a>  | List instance.                                                                                                   |
| <a href="#">des_list_net</a>       | List all nets.                                                                                                   |
| <a href="#">des_list_port</a>      | List port.                                                                                                       |

**Table 39: Design Tcl Commands**

|                                             |                                           |
|---------------------------------------------|-------------------------------------------|
| <code>des_list_reference_udb</code>         | List reference udb(s) for increment flow. |
| <code>des_read_udb</code>                   | Read in a .udb file.                      |
| <code>des_reload_milestone</code>           | Reload milestone result.                  |
| <code>des_report</code>                     | Report design info.                       |
| <code>des_report_flow_status</code>         | Report design flow status.                |
| <code>des_report_instance</code>            | Report instance information.              |
| <code>des_report_net</code>                 | Report a net.                             |
| <code>des_report_operating_condition</code> | Report operating condition.               |
| <code>des_report_port</code>                | Report port information.                  |
| <code>des_set_attribute</code>              | Set design attributes.                    |
| <code>des_set_operating_condition</code>    | Change operating condition.               |
| <code>des_set_reference_udb</code>          | Set reference udb(s) for increment flow.  |
| <code>des_write_udb</code>                  | Write the design into a .udb file.        |

## des\_get\_ram\_cells

Retrieves memory cells in the design that are implemented as either distributed RAM (LUTRAM) or block RAM (EBR).

### Syntax

```
des_get_ram_cells -ramstyle <lutram|ebr>
```

### Arguments

- ▶ **-ramstyle**: Specifies the memory implementation style to filter the results.

Valid values:

- lutram: Distributed RAM (also known as LUTRAM or DPRAM)
- ebr: Embedded Block RAM (also known as EBR)

### Example

```
des_get_ram_cells -ramstyle lutram
Retrieves all memory cells implemented using distributed RAM
(LUTRAM).
```

### See Also

- ▶ [“Design Tcl Commands” on page 1908](#)

## des\_get\_ram\_style

Returns the memory style (LUTRAM or EBR) of a specified RAM cell in the design.

## Syntax

```
des_get_ram_style <cellname>
```

## Arguments

- ▶ **cellname:** The name of the memory cell whose implementation style is to be queried.

## Example

```
des_get_ram_style cellname
```

Returns the memory style (either 'lutram' for distributed RAM or 'ebr' for block RAM) of the specified cell.

## See Also

- ▶ [“Design Tcl Commands” on page 1908](#)

# des\_get\_util\_data

Returns the required resource provided/used in device/design.

## Syntax

```
des_get_util_data [-device] [-lut] [-reg] [-slice] [-dpram]
[-ripplelogic] [-ebr] [-dsp] [-pio] [-pll] [-gsr] [-osc]
```

## Arguments

- ▶ **-device:** Returns the resource data provided in the device (optional).
- ▶ **-lut:** Returns number of LUTs (optional).
- ▶ **-reg:** Returns number of REGs (optional).
- ▶ **-slice:** Return number of Slices (optional).
- ▶ **-dpram:** Returns number of DPRAMs (optional).
- ▶ **-ripplelogic:** Return number of slices used in carry chains (optional).
- ▶ **-ebr:** Return number of EBRs (optional).
- ▶ **-dsp:** Return number of DSPs (optional).
- ▶ **-pio:** Return number of PIOs (optional).
- ▶ **-pll:** Return number of PLLs (optional).
- ▶ **-gsr:** Return number of GSRs (optional).
- ▶ **-osc:** Return number of oscillators (optional).

## Example

```
des_get_util_data -pio
```

Return # of PIO instances used in the design.

```
des_get_util_data -device -pio
```

Return the # of PIOs provides in the device.

If the return value is -1, it means that the selected data type is not available in the device, or the data type has not been supported.

**See Also**

- ▶ [“Design Tcl Commands” on page 1908](#)

**des\_list\_attribute**

Reports design attributes.

**Syntax**

```
des_list_attribute
```

**Example**

```
des_list_attribute
```

**See Also**

- ▶ [“Design Tcl Commands” on page 1908](#)

**des\_list\_instance**

Commands to list specified instances.

**Syntax**

```
des_list_instance [<instances>]
```

**Arguments**

- ▶ **<instances>**: Only lists instances that match the pattern specified in <instances> (optional). If no pattern is specified, all instances will be listed.

**Example**

```
des_list_instance *CWDATA_c*
```

**See Also**

- ▶ [“Design Tcl Commands” on page 1908](#)

## des\_list\_net

Commands to list specified nets.

### Syntax

```
des_list_net [-clock] [-fanout <n>] [-lsort <method>]
[-lsize <n>] [<nets>]
```

### Arguments

- ▶ **-clock**: Lists clock nets only (optional).
- ▶ **-fanout <n>**: Lists nets with # of fanouts  $\geq n$  (optional).
- ▶ **-lsort <method>**: Choose sorting method: 0 - id; 1 - all pins; 2 - clk pins; 3 - global control pins; 4 - normal pins (optional). Defaults to sorting by id.
- ▶ **-lsize <size>**: Limits the number of listed nets to size. Defaults to showing all nets (optional).
- ▶ **<nets>**: Only lists net names that match the pattern specified in <nets> (optional).

### Example

```
des_list_net -fanout 10 -lsort 2 -lsize 10 *D0*
```

This command lists the first 10 nets that start with D0, have a fanout of at least 10, sorted by clk pins first.

### See Also

- ▶ [“Design Tcl Commands” on page 1908](#)

## des\_list\_port

Commands to list specified ports.

### Syntax

```
des_list_port [<ports>]
```

### Arguments

- ▶ **<ports>**: Only lists instances that match the pattern specified in <ports> (optional). If no pattern is specified, all ports will be listed.

### Example

```
des_list_port *CWDATA_c*
```

**See Also**

- ▶ [“Design Tcl Commands” on page 1908](#)

**des\_list\_reference\_udb**

Lists reference udb(s) for incremental flow, if there's any.

**Syntax**

```
des_list_reference_udb
```

**Example**

```
des_list_reference_udb
```

**See Also**

- ▶ [“Design Tcl Commands” on page 1908](#)

**des\_read\_udb**

Commands to read database from udb file.

**Syntax**

```
des_read_udb [-logview <logical udb file>]  
[-phyview <physical udb file>] [<udb file>]
```

**Arguments**

- ▶ **-logview <logical udb file>**: Specifies the logical udb file name (optional).
- ▶ **-phyview <physical udb file>**: Specifies the physical udb file name (optional).
- ▶ **<udb file>**: Specifies the udb file name (optional).  
  
-logview, -phyview, and <udb file> options are mutually exclusive.  
  
If either -logview, -phyview, or both are specified, you cannot specify a udb file.

**Example**

```
des_read_udb -logview logic.udb -phyview phy.udb  
des_read_udb post_par.udb
```

**See Also**

- ▶ [“Design Tcl Commands” on page 1908](#)

## des\_reload\_milestone

Reloads milestone result.

### Syntax

```
des_reload_milestone [-force] [-inc] [-postsyn|-postmap|  
-postplc|-postrte|-postpar] <udb_name>
```

### Arguments

- ▶ **-force**: Forcibly opens the milestone (optional).
- ▶ **-inc**: Loads the milestone result incrementally (optional).
- ▶ **-postsyn**: Opens a post-synthesis milestone (optional).
- ▶ **-postmap**: Opens a post-map milestone (optional).
- ▶ **-postplc**: Opens a post-placement milestone (optional).
- ▶ **-postrte**: Opens a post-routing milestone (optional).
- ▶ **-postpar**: Opens a post-par milestone (optional).
- ▶ **<udb\_name>**: Milestone udb to open (required).

### Example

```
des_reload_milestone -postsyn -inc mydb_syn.udb
```

### See Also

- ▶ [“Design Tcl Commands” on page 1908](#)

## des\_report

Reports design information.

### Syntax

```
des_report
```

### Example

```
des_report
```

### See Also

- ▶ [“Design Tcl Commands” on page 1908](#)

## des\_report\_flow\_status

Reports design flow status.

### Syntax

```
des_report_flow_status
```

### Example

```
des_report_flow_status
```

### See Also

- ▶ [“Design Tcl Commands” on page 1908](#)

## des\_report\_instance

Commands to report specified instances.

### Syntax

```
des_report_instance [<instances>]
```

### Arguments

- ▶ **<instances>**: Only reports instances that match the pattern specified in <instances> (optional).

### Example

```
des_report_instance *CWDATA_c*
```

### See Also

- ▶ [“Design Tcl Commands” on page 1908](#)

## des\_report\_net

Commands to report specified nets.

### Syntax

```
des_list_net [-file <filename>] [<nets>]
```

### Arguments

- ▶ **-file <filename>**: Outputs results into <filename> (optional).
- ▶ **<nets>**: Only reports nets that match the pattern specified in <nets> (optional).

**Example**

```
des_report_net -file mynet.txt *CWDATA_c*
```

**See Also**

- ▶ [“Design Tcl Commands” on page 1908](#)

**des\_report\_operating\_condition**

Reports operating condition information.

**Syntax**

```
des_report_operating_condition
```

**Example**

```
des_report_operating_condition
```

**See Also**

- ▶ [“Design Tcl Commands” on page 1908](#)

**des\_report\_port**

Commands to report specified ports.

**Syntax**

```
des_report_port [<port>]
```

**Arguments**

- ▶ **<ports>**: Only reports ports that match the pattern specified in <ports> (optional). If no pattern is specified, all ports are reported.

**Example**

```
des_report_port *CWDATA_c*
```

**See Also**

- ▶ [“Design Tcl Commands” on page 1908](#)

## des\_set\_attribute

Changes design attributes.

### Syntax

```
des_set_attribute [-impl_dir <name>]
```

### Arguments

- ▶ **-impl\_dir <name>**: Sets implementation directory to <name> (optional). Defaults to current directory otherwise.

### Example

```
des_set_attribute -impl_dir impl_1
```

### See Also

- ▶ [“Design Tcl Commands” on page 1908](#)

## des\_set\_operating\_condition

Changes operating condition of device.

### Syntax

```
des_set_operating_condition [-temperature <temp>]  
[-speed_grade <speed_grade>]
```

### Arguments

- ▶ **-temperature <temp>**: Set device temperature to <temp> degrees Celsius (optional). Defaults to -1.
- ▶ **-speed\_grade <speed\_grade>**: Sets device speed grade to specified setting <speed\_grade> (optional)

### Example

```
des_set_operating_condition -temp 100 -speed_grade 9_High-  
Performance_1.0V
```

Sets temperature to 100 Celcius with High Performance speed grade.

### See Also

- ▶ [“Design Tcl Commands” on page 1908](#)

## des\_set\_reference\_udb

Sets reference udb(s) for incremental flow.

### Syntax

```
des_set_reference_udb [-postsyn <postsyn_udb>]  
[-postmap <postmap_udb>][-postpar <postpar_udb>]  
[-pdc <pdc_file>] [-clean]
```

### Arguments

- ▶ **-postsyn <postsyn\_udb>**: Set post-synthesis reference udb file to <postsyn\_udb> (optional).
- ▶ **-postmap <postmap\_udb>**: Set post-map reference udb file to <postmap\_udb> (optional).
- ▶ **-postpar <postpar\_udb>**: Set post-par reference udb file to <postpar\_udb> (optional).
- ▶ **-pdc <pdc\_file>**: Set reference pdc file to <pdc\_file> (optional).
- ▶ **-clean**: Reset all reference udb settings (optional).

### Example

```
des_set_reference_udb -postsyn mydb_syn.udb -postpar  
mydb_par.udb -pdc mypdc.pdc
```

Set post-synthesis reference udb to mydb\_syn.udb, post-par udb to mydb\_par.udb and pdc file to mypdc.pdc.

```
des_set_reference_udb -clean
```

Removes any reference udb settings.

### See Also

- ▶ [“Design Tcl Commands” on page 1908](#)

## des\_write\_udb

Commands to write udb database file.

### Syntax

```
des_write_udb [-w] [-logview] [-phyview] [<udb file>]
```

### Arguments

- ▶ **-w**: Overwrite existing file (optional).
- ▶ **-logview**: Output logical view (optional).
- ▶ **-phyview**: Output physical view (optional).

- ▶ **<udb file>**: This option specifies the udb file name (optional).  
-logview, -phyview, and <udb file> options are mutually exclusive.

### Example

```
des_write_udb -logview logic.udb -phyview phy.udb
des_write_udb -w post_par.udb
```

### See Also

- ▶ [“Design Tcl Commands” on page 1908](#)

## Device Tcl Commands

The **dev** commands are used re used to access or report device information. You can get these commands by using **help {dev\_\*}**.

The following table provides a listing of all valid Radiant software device-related Tcl command options and describes option functionality.

**Table 40: Device Tcl Commands**

| Command                    | Description             |
|----------------------------|-------------------------|
| <a href="#">dev_report</a> | Report the device info. |

### dev\_report

Report device information.

#### Syntax

```
dev_report
```

#### Arguments

### Example

```
dev_report
```

### See Also

- ▶ [“Device Tcl Commands” on page 1919](#)

# Technology Mapping Tcl Commands

The **map** commands are used to map or transfer a design from a logical view to a physical view.

## Radiant Software Technology Mapping Tcl Command Descriptions

The following table provides a listing of all valid Radiant software mapping-related Tcl command options and describes option functionality.

**Table 41: Technology Mapping Tcl Commands**

| Command                         | Description       |
|---------------------------------|-------------------|
| <a href="#">map_list_option</a> | List map options. |
| <a href="#">map_run</a>         | Run map tool.     |
| <a href="#">map_set_option</a>  | Set map options.  |

## map\_list\_option

List map options.

### Syntax

```
map_list_option
```

### Example

```
map_list_option
```

### See Also

► [“Technology Mapping Tcl Commands” on page 1920](#)

## map\_run

Run the map tool.

### Syntax

```
map_run
```

### Example

```
map_run
```

### See Also

► [“Technology Mapping Tcl Commands” on page 1920](#)

## map\_set\_option

Set the map options.

### Syntax

```
map_set_option {<key> <value> ...}
```

### Example

```
map_list_option
map_set_option {infer_gsr true pdc_file myfile.pdc}
```

### See Also

► [“Technology Mapping Tcl Commands” on page 1920](#)

## Placement Tcl Commands

The **plc** commands are used for automatic/interactive placement.

### Placement Tcl Command Descriptions

The following table provides a listing of all valid Radiant software placement-related Tcl command options and describes option functionality.

**Table 42: Placement Tcl Commands**

| Command                                      | Description                              |
|----------------------------------------------|------------------------------------------|
| <a href="#">plc_list_option</a>              | List placement options.                  |
| <a href="#">plc_output_instance_location</a> | Output instance locations in LDC format. |
| <a href="#">plc_report</a>                   | Report placement information.            |
| <a href="#">plc_run</a>                      | Run placement tool.                      |
| <a href="#">plc_set_option</a>               | Set placement options.                   |

## plc\_list\_option

Lists placement options.

### Syntax

```
plc_list_option
```

### Example

```
plc_list_option
```

**See Also**

- ▶ [“Placement Tcl Commands” on page 1921](#)

## plc\_output\_instance\_location

Outputs instance locations in LDC format.

**Syntax**

```
plc_output_instance_location [-all] [-pio] [-dsp] [-ebr] [-slice] [-all_constraint] -file <filename> [<pattern>]
```

**Arguments**

- ▶ **-all**: Selects all instance types to output (optional).
- ▶ **-pio**: Selects PIO instances to output (optional).
- ▶ **-dsp**: Select DSP instances to output (optional).
- ▶ **-ebr**: Select EBR instances to output (optional).
- ▶ **-slice**: Select slices to output (optional).
- ▶ **-all\_constraint**: Select all constraint instances to output (optional).
- ▶ **-file <filename>**: Specify output file to write to (required).
- ▶ **-<pattern>**: Only output instances that match <pattern> (optional).

**Example**

```
plc_output_instance_location -dsp -file newfile.ldc CW*
```

This example outputs DSP instances that start with CW into a new constraint file called **newfile.ldc**.

**See Also**

- ▶ [“Placement Tcl Commands” on page 1921](#)

## plc\_report

Reports placement information such as sites, comps, bounding box, and estimated wiring segments.

**Syntax**

```
plc_report
```

**Example**

```
plc_report
```

**See Also**

▶ [“Placement Tcl Commands” on page 1921](#)

**plc\_run**

Runs placement tool.

**Syntax**

```
plc_run
```

**Example**

```
plc_run
```

**See Also**

▶ [“Placement Tcl Commands” on page 1921](#)

**plc\_set\_option**

Sets placement options.

**Syntax**

```
plc_set_option {<key> <value> ...}
```

**Example**

```
plc_list_option  
plc_set_option {disable_timing_driven true path_based_placement  
on}
```

**See Also**

▶ [“Placement Tcl Commands” on page 1921](#)

## Routing Tcl Commands

The **rte** commands are used for automatic/interactive routing.

**Routing Tcl Command Descriptions**

The following table provides a listing of all valid Radiant software routing-related Tcl command options and describes option functionality.

**Table 43: Routing Tcl Commands**

| Command                         | Description             |
|---------------------------------|-------------------------|
| <a href="#">rte_list_option</a> | List routing options.   |
| <a href="#">rte_report</a>      | Report routing results. |
| <a href="#">rte_run</a>         | Run the routing tool.   |
| <a href="#">rte_set_option</a>  | Set routing options.    |

## **rte\_list\_option**

List routing options.

### **Syntax**

```
rte_list_option
```

### **Example**

```
rte_list_option
```

### **See Also**

▶ [“Routing Tcl Commands” on page 1923](#)

## **rte\_report**

Report routing results.

### **Syntax**

```
rte_report
```

### **Arguments**

▶ **-net**: Report the nets (optional).

### **Example**

```
rte_report
```

### **See Also**

▶ [“Routing Tcl Commands” on page 1923](#)

## rte\_run

Run the routing tool.

### Syntax

```
rte_run
```

### Example

```
rte_run
```

### See Also

► [“Routing Tcl Commands” on page 1923](#)

## rte\_set\_option

Set routing options.

### Syntax

```
rte_set_option {<key value> ... }
```

### Example

```
rte_list_option  
rte_set_option {disable_timing_driven true}
```

### See Also

[“Routing Tcl Commands” on page 1923](#)

## Timing Analysis Tcl Commands

The **sta** commands are used to run timing analysis interactively, with two major categories, namely **sta\_get** and **sta\_report**. The **sta\_get** command returns the value, which can be used in other sta commands or printed out to the standard output. The **sta\_report** command sends the information to the standard output.

You can get these commands by using **help {sta\_\*}**.

For a complete discussion on interactive static timing analysis using the TCL commands, refer to the [FPGA-AN-02091, Interactive Timing Analysis Using TCL in Lattice Radiant Design Software](#) application note.

As an added reference, you may also refer to the [FPGA-AN-02059, Lattice Radiant Timing Constraints Methodology](#) application note, which provides guidelines and best practices for defining and managing timing constraints in Radiant.

The following table provides a listing of all valid Radiant software timing analysis-related Tcl command options and describes option functionality.

**Table 44: Timing Analysis Tcl Commands**

| Command                                  | Description                                                     |
|------------------------------------------|-----------------------------------------------------------------|
| <a href="#">sta_get_clocks</a>           | Get a list of clocks that satisfy the name.                     |
| <a href="#">sta_get_coverage</a>         | Get the timing coverage for connections.                        |
| <a href="#">sta_get_info</a>             | Get information about a clock or a terminal (port/pin).         |
| <a href="#">sta_get_paths</a>            | Collect detailed paths for query.                               |
| <a href="#">sta_get_slack</a>            | Get the total negative, worst or terminal slack for the design. |
| <a href="#">sta_get_terms</a>            | Get a list of ports and pins that satisfy the name.             |
| <a href="#">sta_path_info</a>            | Extract data from a given path.                                 |
| <a href="#">sta_report_clocks</a>        | Report on a clock or clocks.                                    |
| <a href="#">sta_report_constraints</a>   | List timing constraints.                                        |
| <a href="#">sta_report_timing</a>        | Report detailed or summary timing.                              |
| <a href="#">sta_report_unconstrained</a> | List unconstrained ports, pins, or nets.                        |
| <a href="#">rte_set_option</a>           | Change the style of the timing report.                          |

#### Note

- ▶ To prevent errors, use `des_read_udb` command first to read the PAR UDB before performing timing analysis.
- ▶ If you do not change the default PAR Timing Strategy (Speed Grade for Hold Analysis) and the Junction Temperature value in Device Constraint Editor, there may be differences between the Radiant GUI and the TCL results.
- ▶ In the Radiant GUI Timing Analysis report, the Hold Analysis of STA uses Speed Grade "m" and minimum temperature for the operating condition (for example, 0 °C for commercial and –40 °C for industrial). In the TCL timing analysis, on the other hand, the Hold Analysis of STA uses the speed grade of the device and the maximum temperature for the operating condition (for example, 85 °C for commercial and 100 °C for industrial).

## sta\_get\_clocks

Commands to list requested clocks.

### Syntax

```
sta_get_clocks [<name>]
```

### Arguments

- ▶ **<name>:** Only list clock names that match the pattern specified in <name> (Required)

### Example

```
sta_get_clocks clk *
```

### See Also

- ▶ [“Timing Analysis Tcl Commands” on page 1925](#)

## sta\_get\_coverage

Commands to list specified instances.

### Syntax

```
sta_get_coverage
```

### Example

```
sta_get_coverage
```

**See Also**

- ▶ [“Timing Analysis Tcl Commands” on page 1925](#)

**sta\_get\_info**

Commands to get information about clocks or terminals.

**Syntax**

```
sta_get_info [-clock <clock name>] [-waveform]
[-period] [-duty_cycle] [-terminal <terminal name>]
[-isclockpin] [-isinput] [-isoutput] [-net] [-cell]
[-termClocks]
```

**Arguments**

- ▶ **-clock <clock name>**: Name of clock whose info is requested <clock name> (optional)
- ▶ **-waveform**: requests waveform of clock (optional)
- ▶ **-period**: period of clock will be returned (optional)
- ▶ **-duty\_cycle**: duty cycle will be returned (optional)
- ▶ **-terminal <terminal name>**: Only report on terminal that match the pattern specified in <terminal name> (optional)
- ▶ **-isclockpin**: Returns true if the terminal is a clock pin (optional)
- ▶ **-isinput**: Returns true if the terminal is an input (optional)
- ▶ **-isoutput**: Returns true if the terminal is an output (optional)
- ▶ **-net**: Net connected to terminal (optional)
- ▶ **-cell**: Parent cell of terminal (optional)
- ▶ **-termClocks**: User defined clocks that arrive at the terminal

Option -clock is mutually exclusive with options -terminal, -isclockpin, -isinput, -isoutput, -net, -cell, and -termClocks.

Option -terminal is mutually exclusive with options -waveform, -period, and -duty\_cycle. (optional)

**Example**

```
sta_get_info -clock clk1 -duty_cycle
sta_get_info -terminal abc/LSR -net
```

**See Also**

- ▶ [“Timing Analysis Tcl Commands” on page 1925](#)

## sta\_get\_paths

Change operating condition of device.

### Syntax

```
sta_get_paths [-n <number>] [-endpoints]
[-from <ports/pins>]
[-from_clock <clocks>] [to <ports/pins>]
[-to_clock <clocks>] [-hold] [-summary]
```

### Arguments

- ▶ **-n <number>**: The total number of paths reported is up to <number> paths (optional)
- ▶ **-endpoints**: Report the endpoints only (optional)
- ▶ **-from <ports/pins>**: The from pins of the report are given by <ports/pins> (optional)
- ▶ **-from\_clock <clocks>**: The launch clock of the report are given by <ports/pins> (optional)
- ▶ **-to <ports/pins>**: The to pins of the report are given by <ports/pins> (optional)
- ▶ **-to\_clock <clocks>**: The latch clocks of the report are given by <ports/pins> (optional)
- ▶ **-hold**: Report hold timing paths (optional)
- ▶ **-summary**: Report setup and hold timing errors and total negative slack at the current speed grade (optional)

### Example

```
sta_get_paths -n 5 -from abcd/Q0
```

### See Also

- ▶ [“Timing Analysis Tcl Commands” on page 1925](#)

## sta\_get\_slack

Command to report slack of design or terminal.

### Syntax

```
sta_get_slack [-tns] [-worst] [-hold] [-terminal <terminal>]
```

### Arguments

- ▶ **-tns**: Get the total negative slack of the design (optional)
- ▶ **-worst**: Get the worst slack of the design (optional)
- ▶ **-hold**: Get the hold slack (optional)

- ▶ **-terminal <terminal>**: Get the slack of the terminal specified by <terminal> (optional)  
Option -terminal is mutually exclusive with the options -tns and -worst

### Example

```
sta_get_slack -terminal abcd/e -hold
sta_get_slack -tns
```

### See Also

- ▶ [“Timing Analysis Tcl Commands” on page 1925](#)

## sta\_get\_terms

Command to get a list of terms.

### Syntax

```
sta_get_terms [-ports | -pins] [<name of ports or pins>]
```

### Arguments

- ▶ **-ports**: The name represents ports (optional)
- ▶ **-pins**: The name represents pins (optional)
- ▶ **<name>**: name or ports or pins. Option -ports and -pins are mutually exclusive. (required)

### Example

```
sta_get_terms *
sta_get_terms -ports *
sta_get_terms -pins */LSR
```

### See Also

- ▶ [“Timing Analysis Tcl Commands” on page 1925](#)

## sta\_path\_info

Get information on a given path.

### Syntax

```
sta_path_info [-path <path>] [-slack] [-constraint]
[-skew] [-launch_clock] [-latch_clock] [-levels]
```

### Arguments

- ▶ **-path**: A path object obtained with sta\_get\_paths. (required)

- ▶ **-slack:** Return the slack of the path. (optional)
- ▶ **-constraint:** Returns the value of the constraint that must be met for the given path (optional).
- ▶ **-skew:** Returns the clock skew (optional).
- ▶ **-launch\_clock:** Return the clock launching the data at the start point (optional).
- ▶ **-latch\_clock:** Return the clock capturing the data at the endpoint (optional).
- ▶ **-levels:** Return number of logic levels (optional).

### Example

```
sta_path_info
```

### See Also

- ▶ [“Timing Analysis Tcl Commands” on page 1925](#)

## sta\_report\_clocks

Report design clocks.

### Syntax

```
sta_report_clocks [-clocks <clocks>] [-file <file name>] [-app]
```

### Arguments

- ▶ **-clocks <clocks>:** Report clocks that are indicated by <clocks> (optional)
- ▶ **-file <file name>:** Name of file that report is to be redirected to (optional)
- ▶ **-app:** Append report to end of file (optional)

### Example

```
sta_report_clocks -clocks cl* -file abc -app
```

### See Also

- ▶ [“Timing Analysis Tcl Commands” on page 1925](#)

## sta\_report\_constraints

Command to list timing constraints.

### Syntax

```
sta_report_constraints [-file <file name>] [-app]
```

### Arguments

- ▶ **-file <file name>**: Name of file that report is to be redirected to <file name> (optional)
- ▶ **-app**: Append the report to an existing file (optional)

### Example

```
sta_report_constraints
sta_report_constraints -file abc -app
```

### See Also

- ▶ [“Timing Analysis Tcl Commands” on page 1925](#)

## sta\_report\_timing

Change operating condition of device.

### Syntax

```
sta_report_timing [-n <number>] [-endpoints]
[-from <ports/pins>] [-from_clock <clocks>]
[to <ports/pins>] [-to_clock <clocks>] [-hold]
[-summary] [-file <file name>] [-app]
```

### Arguments

- ▶ **-n <number>**: The total number of paths reported is up to <number> paths (optional).
- ▶ **-endpoints**: Report the endpoints only (optional)
- ▶ **-from <ports/pins>**: The from pins of the report are given by <ports/pins> (optional)
- ▶ **-from\_clock <clocks>**: The launch clock of the report are given by <ports/pins> (optional)
- ▶ **-to <ports/pins>**: The pins of the report are given by <ports/pins> (optional)
- ▶ **-to\_clock <clocks>**: The latch clocks of the report are given by <ports/pins> (optional)
- ▶ **-hold**: Report hold timing paths (optional)
- ▶ **-summary**: Report setup and hold timing errors and total negative slack at the current speed grade (optional)

- ▶ **-file <file name>**: Redirect the report to the file <file name> (optional)
- ▶ **-app**: Append report to the end of the file (optional)

### Example

```
sta_report_timing -n 5 -from abcd/Q0
```

### See Also

- ▶ [“Timing Analysis Tcl Commands” on page 1925](#)

## sta\_report\_unconstrained

Command to report unconstrained terminals.

### Syntax

```
sta_report_unconstrained [-n <number>] [-start] [-end]  
[-io] [-clock_nets] [-file <file name>] [-app]
```

### Arguments

- ▶ **-n <number>**: Report up to the number specified in <number> (optional)
- ▶ **-start**: Report unconstrained timing start point pins (optional)
- ▶ **-end**: Report unconstrained timing endpoint pins (optional)
- ▶ **-io**: Report unconstrained IOs (optional)
- ▶ **-clock\_nets**: Report clock nets without a clock definition (optional)
- ▶ **-file**: File to which the report is redirected (optional)
- ▶ **-app**: Append report at the end of the file (optional)

### Example

```
sta_report_unconstrained -file abc -start -app  
sta_report_unconstrained
```

### See Also

- ▶ [“Timing Analysis Tcl Commands” on page 1925](#)

# Other Commands

## Design Object Tcl Commands

Design objects can be referred to in the SDC as a single object, or as a collection of objects. Single objects must be referred to as a collection of a single object. The current implementation of the SDC commands allows only single objects in the collection. The exception to this are the `all_*` commands.

The `get_info` commands are used for constraints to return a single object, or a collection of objects. You can get this command by using `help {get_*}`.

### Radiant Software Design Object Tcl Command Descriptions

The following table provides a listing of all valid Radiant software design object-related Tcl command options and describes option functionality.

In the example below, *<target name>* is a regular expression that matches one object only.

## Clock Object

| SDC Collection          | Description                                        |
|-------------------------|----------------------------------------------------|
| <code>get_clocks</code> | Return clock objects.                              |
| <code>all_clocks</code> | Return a list of all clocks in the current design. |

This section displays the usage information of the commands:

### get\_clocks

```
% help get_clocks
get_clocks - Commands to get clocks
Usage:
    get_clocks [-regexp] [-nocase] <patterns>
```

### all\_clocks

```
% help all_clocks
all_clocks - Commands to get a list of all clocks in the
current design
Usage:
    all_clocks
```

## Radiant Software Clock Object Tcl Commands Example

This section illustrates and describes a few samples of Radiant clock object Tcl commands.

### Example 1

*<target name>* is the name of the clock. Clock is either given a name or gets its name from the port/net on which it is defined.

```
get_clocks <target name>
[get_clocks clock_fast]

[all_clocks]
```

## Port Object

| SDC Collection                | Description                                              |
|-------------------------------|----------------------------------------------------------|
| <a href="#">get_port_info</a> | Return port object information.                          |
| <a href="#">get_ports</a>     | Return port objects.                                     |
| <a href="#">all_inputs</a>    | Return a list of all input ports in the current design.  |
| <a href="#">all_outputs</a>   | Return a list of all output ports in the current design. |

## get\_port\_info

Commands to return port info.

### Syntax

```
get_port_info [-name] [-is_inout] [-is_input] [-is_output]
<port_object>
```

### Arguments

- ▶ **-name:** This option indicates that the command will output the name of the specified port (optional).
- ▶ **-is\_inout:** This option indicates that the command will output if the specified port is an inout port (optional).

- ▶ **-is\_input:** This option indicates that the command will output if the specified port is an input port (optional).
- ▶ **-is\_output:** This option indicates that the command will output if the specified port is an output port (optional).
- ▶ **port\_object:** This value specifies one port object whose information will be output.

### Example

The following example outputs whether port 'seg\_out[0]' is an output port:

```
get_port_info -is_output [get_ports {seg_out[0]}]
```

### See Also

- ▶ [“Port Object” on page 1935](#)

## get\_ports

Commands to get a list of ports in the current design.

### Syntax

```
get_ports [-regexp] [-nocase] [<patterns>]
```

### Arguments

- ▶ **-regexp:** This option indicates that patterns are full regular expressions (optional).
- ▶ **-nocase:** This option indicates that matching is case-insensitive (optional).
- ▶ **patterns:** This value specifies the patterns against which net names are matched (optional). If no pattern is specified, set '\*' as default.

### Example

```
get_ports -nocase -regexp clk\[0-9\]+
```

### See Also

- ▶ [“Port Object” on page 1935](#)

## all\_inputs

Commands to get a list of all input ports in the current design.

### Syntax

```
all_inputs
```

**Example**

The following example returns all input ports in the current design:

```
all_inputs
```

**See Also**

► [“Port Object” on page 1935](#)

**all\_outputs**

Commands to get a list of all output ports in the current design.

**Syntax**

```
all_outputs
```

**Example**

The following example returns all output ports in the current design:

```
all_outputs
```

**See Also**

► [“Port Object” on page 1935](#)

**Cell Object**

| SDC Collection                | Description              |
|-------------------------------|--------------------------|
| <a href="#">get_cell_info</a> | Return cell information. |
| <a href="#">get_cells</a>     | Return instance objects. |

This section displays the usage information of the commands:

**get\_cell\_info**

```
% help get_cell_info
get_cell_info - Commands to return cell info
Usage:
    get_cell_info [-name] [-inpins] [-outpins] [-pins]
    <cell_object>
```

## get\_cells

```
% help get_cells
get_cells - Commands to get instances
Usage:
    get_cells [-hierarchical] [-regexp] [-nocase] [-of_objects
<objects>] <patterns>
```

### Radiant Software Cell Object Tcl Commands Example

This section illustrates and describes a few samples of Radiant cell object Tcl commands.

#### Example 1

The command returns collection of a design instance that matches *<target name>*.

```
[get_cells <target name>]
[get_cells {reg6 reg7}]
```

## Net Object

| SDC Collection               | Description             |
|------------------------------|-------------------------|
| <a href="#">get_net_info</a> | Return net information. |
| <a href="#">get_nets</a>     | Return net objects.     |

## get\_net\_info

Commands to return net info.

### Syntax

```
get_net_info [-name] [-pin] <net_object>
```

### Arguments

- ▶ **-name:** This option indicates that the command will output the name of the specified net (optional).
- ▶ **-pin:** This option indicates that the command will list pin names of specified net (optional).
- ▶ **net\_object:** This value specifies one net object whose information will be listed.

### Example

The following example lists pin names of net 'CLK':

```
get_net_info -pin [get_nets CLK]
```

### See Also

- ▶ [“Net Object” on page 1938](#)

## get\_nets

Commands to get a list of nets in the current design.

### Syntax

```
get_nets [-hierarchical] [-regexp] [-nocase] [-of_objects  
<objects>] [<patterns>]
```

### Arguments

- ▶ **-hierarchical:** This option indicates that the command will get nets from all levels of the design hierarchy (optional). Without this argument, the command will only get nets from the top of the design hierarchy.
- ▶ **-regexp:** This option indicates that patterns are full regular expressions (optional).
- ▶ **-nocase:** This option indicates that matching is case-insensitive (optional).
- ▶ **-of\_objects objects:** This option indicates that the command will get nets of these objects (PINs or INSTANCES) (optional). When this argument is effective, other arguments will not work.
- ▶ **patterns:** This value specifies the patterns against which net names are matched (optional). If no pattern is specified, set '\*' as default.

### Example

```
get_nets -hierarchical -nocase -regexp clk\[0-9]+  
get_nets -of_objects [get_pins {i*/*}]
```

### See Also

- ▶ [“Net Object” on page 1938](#)

## Pin Object

| SDC Collection               | Description             |
|------------------------------|-------------------------|
| <a href="#">get_pin_info</a> | Return pin objects.     |
| <a href="#">get_pins</a>     | Return pin information. |

### get\_pin\_info

Commands to return pin info.

#### Syntax

```
get_pin_info [-name] [-is_clock] [-is_input] [-is_output]
[-net] [-parent_cell] <pin_object>
```

#### Arguments

- ▶ **-name:** This option indicates that the command will output the name of the specified pin (optional).
- ▶ **-is\_clock:** This option indicates that the command will output if the specified pin is a clock pin (optional).
- ▶ **-is\_input:** This option indicates that the command will output if the specified pin is an input pin (optional).
- ▶ **-is\_output:** This option indicates that the command will output if the specified pin is an output pin (optional).
- ▶ **-net:** This option indicates that the command will output the net name of the specified pin (optional).
- ▶ **-parent\_cell:** This option indicates that the command will output the instance name of the specified pin (optional).
- ▶ **pin\_object:** This value specifies one pin object whose information will be output.

#### Example

The following example outputs instance name of pin 'fifo\_inst/state\_0':

```
get_pin_info -parent_cell [get_pins fifo_inst/state_0]
```

#### See Also

- ▶ [“Pin Object” on page 1940](#)

### get\_pins

Commands to get a list of pins in the current design.

## Syntax

```
get_pins [-hierarchical] [-regexp] [-nocase]  
[-of_objects <objects>] [<patterns>]
```

## Arguments

- ▶ **-hierarchical:** This option indicates that the command will get pins from all levels of the design hierarchy. Without this argument, the command will only get pins from the top of the design hierarchy (optional).
- ▶ **-regexp:** This option indicates that patterns are full regular expressions (optional).
- ▶ **-nocase:** This option indicates that matching is case-insensitive (optional).
- ▶ **-of\_objects objects:** This option indicates that the command will get pins of these objects (NETs or INSTANCES). When this argument is effective, other arguments won't work (optional).
- ▶ **patterns:** This value specifies the patterns against which net names are matched. If no pattern is specified, set '\*' as default (optional).

## Example

```
get_pins -hierarchical -nocase -regexp clk\[0-9]+  
get_pins -of_objects [get_nets {clk*}]
```

## See Also

- ▶ [“Pin Object” on page 1940](#)

## Wildcard Support

Multiple wildcard (\*) is supported. In addition, the wildcard should be at the end or beginning of the object name string. For example:

ab\* matches abc, ab, abdefg, etc.

\*bc matches abc, bbc, debc, etc.

---

## Note

1. Wildcard \* can be used in any position of object name such as a\*, \*b, a\*b etc.
  2. Wildcard \* cannot cross hierarchical separator /. For example get\_cells sub1/\* only returns sub1/sub2 and does not return sub1/sub2/sub1 or sub1/sub2/sub1/sub2.
  3. When -hierarchical is set, it will search all levels of the design hierarchy starting at the current instance.
-

# Engineering Change Order Tcl Commands

This section provides Engineering Change Order (ECO) extended Tcl command syntax, command options, and usage examples.

## ECO Tcl Command Descriptions

The following table provides a listing of all valid Radiant software ECO-related Tcl command options and describes option functionality.

**Table 45: ECO Tcl Commands**

| Command                           | Description                    |
|-----------------------------------|--------------------------------|
| <a href="#">eco_config_block</a>  | Config general IP.             |
| <a href="#">eco_config_memory</a> | Update memory initial value.   |
| <a href="#">eco_config_sysio</a>  | Config sysio setting.          |
| <a href="#">eco_save_design</a>   | Save design in memory to disk. |

## eco\_config\_block

Configures general IP.

### Syntax

```
eco_config_block -comp <comp_name> (<key=value>)..
```

### Arguments

- ▶ **-comp <comp\_name>**: Specifies the IP instance name.
- ▶ **(<key=value>)...**: Specifies attribute key and value.

### Example

```
eco_config_ip -comp DPHY1 {"Speed Select"="2.5Gbps"}
```

### See Also

- ▶ [“Engineering Change Order Tcl Commands” on page 1942](#)

## eco\_config\_memory

Updates memory initial value.

### Syntax

```
eco_config_memory -mem_id <memory_id> (-init_file <mem_file> -
format HEX|BIN|ADDR) | -all_0 | -all_1
```

### Arguments

- ▶ **-mem\_id**: Specifies the memory ID.
- ▶ **-init\_file**: Specifies the memory file path.
- ▶ **-format**: Specifies memory file format. The valid format is HEX, BIN or ADDR.
- ▶ **-all\_0**: Config memory all data to zero.
- ▶ **-all\_1**: Config memory all data to 1. Option '-init\_file' '-all\_0' and '-all\_1' are mutually exclusive.

### Example

```
eco_config_memory -mem_id {top} -all_0
eco_config_memory -mem_id {ram_dq} -all_1
eco_config_mem -mem_id {mem} -init_file {D:/mem/init_hex.mem} -
format HEX
eco_config_memory -mem_id
{large_ram_inst.lscclram_inst.genblk1.LRAM_0.LRAM_0.LRAM_inst}
-init_file {D:/memory/lram_eco/mem.bin} -format BIN
```

### See Also

- ▶ [“Engineering Change Order Tcl Commands” on page 1942](#)

## eco\_config\_sysio

Config sysio setting.

### Syntax

```
eco_config_sysio -comp <comp_name> (<key=value>)...
```

### Arguments

- ▶ **-comp <comp\_name>**: Specifies the instance name.
- ▶ **(<key=value>)...**: Specifies one or more sysio key and value settings.

**Example**

```
eco_config_sysio -comp {c[0]}  
{diffdrive=NA;diffresistor=OFF;diff_invert=NA;drive=8;  
early_io=ON;glitchfilter=OFF;hysteresis=NA;opendrain=OFF;  
pullmode=NONE;slewrates=LOW;termination=OFF;vref=OFF}  
eco_config_sysio -comp {c[1]}  
{diffdrive=NA;diffresistor=OFF;diff_invert=NA;drive=50RS}
```

**See Also**

- ▶ [“Engineering Change Order Tcl Commands” on page 1942](#)

**eco\_save\_design**

Saves current design to disk.

**Syntax**

```
eco_save_design [-udb <udb_file>]
```

**Arguments**

- ▶ **-udb <udb\_file>**: Specifies the output udb file (optional).

**Example**

```
eco_save_design -udb eco.udb  
eco_save_design
```

**See Also**

- ▶ [“Engineering Change Order Tcl Commands” on page 1942](#)

## sta\_set\_option

Commands to read database from udb file.

### Syntax

```
sta_set_option [-name <logical or physical>] [-worst_delay]
```

### Arguments

- ▶ **-name <logical or physical>**: This option controls the name used in reports (optional)
- ▶ **-worst\_delay**: This option activates mixed temperature delay data (optional)

### Example

```
sta_set_option -name physical  
sta_set_option -worst_delay
```
